TEN VOLUMES.

—(2.)—

CATTLE PLAGUE AND IMPORTATION OF LIVE STOCK.

Session

8 *February* —— 14 *August* 1877.

VOL. IX.

1877.

REPORTS FROM COMMITTEES:

1877.

TEN VOLUMES:—CONTENTS OF THE

SECOND VOLUME.

N.B.—*THE* Figures *at the* beginning of the line, *correspond with the* N° *at the foot of each* Report; *and the* Figures *at the* end of the line, *refer to the* MS. Paging *of the Volumes arranged for The House of Commons.*

CATTLE PLAGUE AND IMPORTATION OF LIVE STOCK:

362. Report from the Select Committee on Cattle Plague and Importation of Live Stock; together with the Proceedings of the Committee, Minutes of Evidence, Appendix, and Index - - - - p. 1

REPORT

FROM THE

SELECT COMMITTEE

ON

CATTLE PLAGUE

AND

IMPORTATION OF LIVE STOCK;

TOGETHER WITH THE

PROCEEDINGS OF THE COMMITTEE,

MINUTES OF EVIDENCE,

AND APPENDIX.

Ordered, by The House of Commons, *to be Printed,*
25 *July* 1877.

362.

Tuesday, 24th April 1877.

Ordered, THAT a Select Committee be appointed to inquire into the causes of the recent outbreak of Cattle Plague, and the measures taken for its repression; and into the effect which the importation of live foreign animals has upon the introduction of disease into this country, and upon the supply and price of food.

Tuesday, 1st May 1877.

Ordered, THAT the Committee do consist of Twenty-seven Members.

Committee nominated of—

Sir Henry Selwin Ibbetson.
Mr. William Edward Forster.
Mr. Chaplin.
Mr. Jacob Bright.
Mr. Wilbraham Egerton.
Colonel Kingscote.
Mr. James Corry.
Mr. Pease.
Sir George Jenkinson.
Mr. Chamberlain.
Sir Rainald Knightley.
Mr. Murphy.
Mr. Elliot.
Mr. Mundella.
Mr. Cameron of Lochiel.
Mr. Arthur Peel.
Mr. Ritchie.
Mr. John Holms.
Mr. Torr.
Mr. Anderson.
Major Allen.
Mr. Norwood.
Mr. Assheton.
Mr. French.
Mr. King-Harman.

Thursday, 3rd May 1877.

Further proceeding resumed on nomination of the Committee.

Ordered, THAT Mr. Dease be one other Member of the Committee.

Ordered, THAT Mr. M'Lagan be nominated one other Member of the Committee.

Ordered, THAT the Committee have power to send for Persons, Papers, and Records.

Ordered, THAT Five be the Quorum of the Committee.

Monday, 7th May 1877.

Ordered, THAT the Minutes of the Evidence taken before the Select Committee on Contagious Diseases (Animals) in Session 1873, be referred to the Select Committee on Cattle Plague and Importation of Live Stock.

REPORT - - - - - - - - - - - - - - p. iii
PROCEEDINGS OF THE COMMITTEE - - - - - p. xi
MINUTES OF EVIDENCE - - - - - - - - - p. 1
APPENDIX - - - - - - - - - - - - - p. 499

REPORT.

THE SELECT COMMITTEE appointed to inquire into the Causes of the recent Outbreak of CATTLE PLAGUE, and the Measures taken for its Repression; and into the Effect which the Importation of LIVE FOREIGN ANIMALS has upon the Introduction of DISEASE into this COUNTRY, and upon the Supply and Price of FOOD;——HAVE considered the Matters to them referred, and have agreed to the following REPORT:—

1. YOUR Committee have examined witnesses from the Privy Council Department and representatives of the different trades affected, as well as of the agricultural interest, and have taken much evidence as to the dead meat trade recently established with America, and the supply of food to the manufacturing towns.

2. They have had before them the evidence taken upon this subject by the Committee of 1873, and their Report.

3. Your Committee will first consider the question of cattle plague.

4. They have carefully gone into the causes of the recent outbreak, and have ascertained that the disease was imported by animals arriving from Hamburgh before the authorities here had any official intimation of the outbreak at that place. They are glad to be able to report that they are satisfied by the evidence that, with proper regulations, cattle plague might be stamped out in a short time, and that no ground really exists for the fear of its becoming as destructive as it was in 1865. But the existing provisions, whether for its prevention or for its suppression, require considerable improvement.

5. With respect to the risk of introduction of disease into this kingdom, serious difficulties must always surround the importation of cattle from abroad, especially from a country like Germany, with a long exposed frontier. In such a case no measures short of prohibition would give the necessary security; whilst as to other countries the evidence leaves no doubt as to the necessity of Foreign Governments imposing stricter regulations on their export trade in live stock, and especially providing that notice of any outbreak of cattle plague shall be forthwith communicated by telegraph to the authorities of this country. These are matters which should be made the subject of international arrangement.

6. With regard to home arrangements, the recent outbreak in this country suffices to prove that the system under which the powers of dealing with disease are, in the first instance, committed to the local authority, does not work satisfactorily, and that the powers of the Privy Council should, in every instance, be exercised at the earliest moment, and that, with this view, it should be the duty of the local authority at once to inform the Privy Council of any outbreak of the malady.

7. That the power to order the slaughter of suspected animals should extend to animals on premises adjoining to those actually infected seems as necessary to your Committee, as it did to the Committee of 1873.

8. Your Committee are also of opinion that further inducement should be held out to owners of stock to report the first appearance of the cattle plague amongst their stock. At present, whilst one-half of the value is paid as compensation for any animal actually diseased, only three-quarters is allowed for an animal slaughtered on suspicion. Your Committee consider that in the latter case the full value should be paid, subject only to a maximum of 40 *l.*

9. Lastly, your Committee recommend that all compensation for the slaughter of animals on account of cattle plague, whether such animals are actually diseased or only suspected, should in future be defrayed out of imperial and not, as now, out of local funds. This change in the incidence of the charge is almost a necessary consequence of the change previously recommended, under which the order for slaughter will, in all cases, proceed from the central instead of the local authority; but apart from this it appears justified by considerations of public expediency. The rapidity with which cattle plague, if left unchecked, spreads far and wide makes it a matter of general concern that measures should be immediately taken for its suppression. Experience has shown that it can with certainty be suppressed by the slaughter of all animals within the zone of suspicion, and by no other course; and further, that if the case is promptly dealt with, the limits of this zone are comparatively narrow. The order for the necessary slaughter is therefore one which should be made without hesitation, and any compensation which in consequence becomes payable may be deemed a cheap insurance against what would otherwise become a national misfortune.

10. But cattle plague is not the only question. It was abundantly proved in evidence that the ravages of cattle plague since the Act of 1869, and the diminution of the breeding herds of the kingdom from the fear of breaking out of cattle plague are as nothing compared with the losses inflicted and the enterprise checked by pleuro-pneumonia and foot-and-mouth complaint. In addition to the losses to the community of animals actually destroyed by either of those diseases, or slaughtered to prevent the spread of pleuro-pneumonia, the agricultural and other witnesses laid great stress on the fact, that whatever loss fell upon the farmer from the deterioration of his stock through foot-and-mouth complaint, reacted injuriously on the consumer, by the diminution in the number of fat stock which the farmer was able to place on the market in a given time.

11. One witness, it is true, Mr. Gebhart, questioned the capability of the grazing lands of the country to support herds much larger than those which now exist, but in this view he stood alone. Witnesses with practical experience like Mr. Booth, Mr. Clare Read, Mr. Jacob Wilson, Mr. James Howard, Mr. Adam Smith, and the President of the Scotch Chamber of Commerce, Mr. Melvin, all agreed that if immunity from these two scourges were assured beforehand, such an increase might be anticipated in the breeding herds as would in the course of a certain time be large enough to make up for whatever diminution of supply might be occasioned by any new restrictions on the import from foreign countries.

12. Both these diseases are attributed to foreign origin; at all events, it was admitted that they are widely prevalent in some countries from which importation now takes place; and the number of cargoes stopped at the ports on account of disease having been actually discovered in the animals when landed, justifies the opinion that in many other cases animals really contagious are passed by the inspectors at the ports, owing to the voyage having been too short to allow the malady to develop to that stage where it is open to detection. This is more especially the case in pleuro-pneumonia, which has often been known to lie dormant for periods varying from two to three months.

13. If, however, it was proved how inseparable from the importation of foreign cattle is the risk of the introduction of these two diseases, it was shown beyond a doubt, that at the present moment they both exist so largely in this country that unless further restrictions are applied to the movements of our home stock, no restrictions on the foreign trade can give the least hope of the eradication of these diseases which is the necessary condition of any adequate development of the home supply. In fact it was admitted by every witness, that if these diseases are to be stamped out, both kinds of restrictions were equally indispensable.

14. In

14. In the opinion, therefore, of your Committee, the first matter to be decided really is, whether the farmers of this country are prepared to submit to the inconvenience of such home regulations as may be found to be requisite. Should this be the case, then, and then only would arise the further question as to whether new restrictions should be placed on the foreign import.

15. Adopting this order, your Committee proceed to consider the home regulations which the various witnesses insisted upon as necessary.

16. On this point, Professor Brown expressed a very strong opinion, that whether for the purpose of dealing with cattle plague, should it arise, or of stamping out pleuro-pneumonia and foot-and-mouth disease, one of the most important amendments of the existing system would be the establishment of uniform regulations applicable to the whole country, such regulations to be issued by the Privy Council, and to be carried out by Privy Council inspectors stationed in each district.

17. So far as relates to the necessity of uniform rules to be issued by the central authority, Professor Brown's views were strongly supported by Lord Fitzhardinge, Mr. Rea, Mr. Wilson, Mr. Stratton, Mr. Adam Smith, Mr. Melvin, Mr. Soulby, and Mr. Clare Read, on the part of the agricultural interests; by Mr. Tisdall, representing the Dairymen's Society; by Mr. Giblett and Mr. Lambert, two salesmen; and by Mr. P. Rudkin, on the part of the market authority of the City of London. The evils of the present want of uniformity were forcibly illustrated by Mr. Wilson's description of the different regulations which had recently prevailed at the meeting point of the districts of three local authorities at Newcastle.

18. But when it came to that part of the suggestion which placed the appointment of the local inspectors in the central authority, the witnesses were not so unanimous. Lord Fitzhardinge, Mr. Rea, Mr. Wilson, Mr. Adam Smith, Mr. Tisdall, and Mr. Stratton were of opinion that if, as they suggested, the central authority were to make regulat ons for the whole of the country, the central authority should also, in order to ensure their regulations being carried out, have the nomination of the inspectors. On the other hand, Mr. Melvin recommended that the localities should appoint their own inspectors as now, but that the Privy Council should have a travelling staff to see that these local inspectors properly carried out the rules, just as inspectors of the Local Government Board supervise the action of the local poor law authorities. Mr. C. Read supported the latter view, with the qualification that all local authorities in the same county should be united for the purpose of appointing inspectors, whilst Mr. James Howard and Mr. Soulby urged that the police, responsible, as they are, to quarter sessions in counties and to town councils in boroughs, are sufficient to carry out any regulations, subject only to the intervention of the Privy Council in the case of a serious outbreak.

19. Your Committee are of opinion that the Privy Council could not undertake the work of local inspection throughout the kingdom, and agree with Mr. Melvin that the appointment of inspectors should rest with the local authority, subject to the supervision of the Privy Council.

20. But whatever difference of opinion existed as to the authority which should enforce the regulations, it was admitted that farmers would find themselves under a much stricter *régime* than that which has hitherto been in operation, inasmuch as in every district where either pleuro-pneumonia or foot-and-mouth disease existed all movement of cattle would be prohibited except under license; fairs and markets would be under similar restrictions, and absolute prohibition of movement would be enforced against infected farms for periods varying from two months in pleuro-pneumonia to 28 days in outbreaks of foot-and-mouth disease. Further, the same regulations would have to be extended to Ireland and the Channel Islands, or else animals brought by sea from those parts of the kingdom should not be permitted to be landed except at defined ports, where provision was made for subjecting them to proper inspection.

21. Upon the question whether such restrictions would be accepted, Professor Brown stated his own opinion to be that as these restrictions must be expected

to last for a considerable period before the diseases could be stamped out, the country would not endure them, and would prefer the continuance of the diseases to such a cure. Professor Brown, however, admitted that this opinion was not in accordance with what he had been informed were the views of agriculturists; and as a fact, with the one exception of Mr. Soulby, all the agricultural witnesses who appeared before your Committee—and many of them spoke as representatives of large bodies of farmers in various parts of the country—expressed themselves with confidence that, provided there was an assurance against the re-introduction of disease from abroad, these home regulations would be willingly accepted by the farmers of the country.

22. And your Committee with this evidence before them can hardly resist the conclusion that such would be the case.

23. In the belief then that such regulations as have been indicated would be accepted by the home trade, your Committee pass to the question as to what additional restrictions to the foreign trade would have to be combined with such home regulations in order to give the requisite security.

24. The inspection at the ports being admittedly insufficient as a protection against pleuro-pneumonia, and uncertain even in the case of foot-and-mouth complaint, some witnesses advocated the total prohibition of live animals from abroad, suggesting their slaughter at the port of embarkation. But the greater number of the agricultural witnesses, including Mr. Odams, Mr. James Howard, Mr. Melvin, and Mr. Clare Read, admitted the difficulties of such a course, considering that the country was not prepared for so complete a change, and that the result might be to drive the foreign supply into other markets. They therefore preferred to advise the compulsory slaughter of imported animals at the port of debarkation, all countries, with the exception perhaps of America, being thus treated as scheduled countries are at the present moment.

25. A third proposal which was brought before your Committee was, that on the one hand, so far as regards Belgium and Germany, the importation from those countries of live cattle should be absolutely prohibited, and of live sheep should be allowed only on the condition that they should be slaughtered at the port of debarkation; and that, on the other, as to unscheduled countries, such as Spain, Portugal, and Denmark now are, all animals coming from there should be freely admitted into our ports and allowed to pass inland, provided only that the Privy Council were satisfied with the precautionary regulations in force in such countries.

26. This suggestion as to the prohibition of the importation of cattle from Germany and Belgium, was founded on the extreme uncertainty of obtaining timely information here of any outbreak of disease in Germany, and on the consideration that Belgium is a transit country for German cattle.

27. On the wholé, after considering the various alternatives, your Committee would recommend that, as a statutory arrangement, the importation of all animals from Russia, and all cattle from Germany (with the exception of Schleswig-Holstein) and Belgium, should be prohibited, and these last two countries as to other animals, and the rest of Europe as to all animals, should be added to the list of scheduled countries, with power to the Privy Council to forbid the importation of animals from other countries if they think fit.

And all fat cattle imported therefrom should be slaughtered at the port, such ports being defined, of debarkation; and that all store, or dairy, cattle should be quarantined for 14 days at certain defined ports of lading. Such stock, on removal, to be registered as to where sent, and there to be under restraint and immovable for two months.

28. Your Committee believe that these combined restrictions at the ports and inland, would succeed, if enforced, in stamping out these diseases, and assuming this to be the case, the great question would still remain how far the result would affect the supply of meat to the country, especially to large manufacturing towns.

29. It was acknowledged that to bring about such an increase in the home supply as the witnesses anticipated from the greater security against these complaints,

complaints, must take time; and the foreign importers and salesmen who opposed these restrictions asserted, as they did in 1873, that any such interference with the present established trade as would arise from slaughter at the ports would drive the foreign trade to other markets, and thus not only reduce the supply and make meat dearer, but in the interval before the promised increase in the home stock had been realised, raise the price of meat unduly in many of our inland towns.

30. On the other hand, many practical witnesses assured your Committee that instead of diminishing and driving away the supply, the establishment of any fixed rule rendering slaughter at the port compulsory would really increase the number and the quality of the animals sent. They pointed out that the present regulations are not favourable to the exporter. The fact that if on the arrival of his cargo at the port of debarkation disease is detected he has to reship his animals and take them on to Deptford, or some other port for immediate slaughter, renders him at all times uncertain of his market, and frequently puts him to much expense. The same causes, in their opinion, operate injuriously to Deptford Market itself. The supply to that market mainly comes either from countries temporarily scheduled, *i. e.*, countries from which cattle cannot be imported except into a port where provision is made for their immediate slaughter, or else from casual cargoes which were originally consigned to other ports, but which on account of infection having broken out it has been necessary to bring on to Deptford for slaughter. The supply, therefore, is uncertain from day to day; buyers in consequence are not attracted, and from the want of competition prices are irregular. If, on the other hand, it was once made a rule that all foreign animals are to be slaughtered on their arrival in port, it was confidently asserted that a steady trade would arise, and competition be the same as at Islington Market; and in confirmation of this view it was shown that during the recent period of restrictions large supplies had been sent over with the full knowledge that the animals would be slaughtered at the port.

31. It was next objected, that even if the number of animals sent to this country was not diminished by the animals being slaughtered at the ports, the difficulties of carrying the animals from those ports as dead meat to the inland towns would in hot weather be so great as to deprive those towns of much of their present supply, more particularly in foreign sheep; and the butchers from northern towns especially urged that their trade could not be carried on unless they were able as now to take the live animals from the port of debarkation to their own slaughter-houses, there to be killed as wanted for their customers.

32. But the evidence given by Mr. Rudkin, strengthened as it was by that of the Deputy Chairman of the Great Western Railway, Sir Alexander Wood, and other witnesses, lead your Committee to believe that these fears are without foundation, that there is no real difficulty in the supply of dead meat, and, with proper arrangements, even of offal to these towns, and that for some time a dead-meat trade, especially in sheep, has been regularly carried on from the Deptford Market all over the country, increasing since the restrictions were enforced. Dead sheep have been also sent in large numbers to Wales, not unfrequently coming back to London as Welch mutton. And the fact that the Aberdeen supply of dead meat to the London market has of late largely increased (reaching an average of from 60 or 70 tons a day, even in hot weather), affords additional evidence in this direction.

33. Having, then, carefully considered the evidence, your Committee have arrived at the conclusion that compulsory slaughter, at the port of debarkation, is not likely either to discourage foreign importation, or to diminish the supply of our large towns, or generally to raise the price of meat. The change, however, would be a considerable interferenee with the present system of trade carried on by butchers and salesmen. For this reason, and because proper arrangements would in many cases have to be made at the ports selected for debarkation, your Committee feel that it would be well to postpone the commencement of the change for a time sufficient to enable the necessary preparations to be carried out.

34. With regard to the importation of dead meat from America, as affecting this question, the evidence shows that there are hardly any limits to the amount of meat which can be imported from that country; that in cool weather the meat can without difficulty be delivered here in perfect order, and that with greater care in the packing, and with better arrangements for storage here, it could be brought over in the hottest months. American meat already forms a useful supplementary supply to the meat markets of this country, and in no very distant future will probably constitute a most important addition, and will materially aid the carrying out of such a system as your Committee have suggested above. But the trade is at present in too uncertain and experimental a condition to justify reliance upon it for an unfailing supply.

35. Another important recommendation which was suggested for checking the spread of these diseases was made by Mr. Rudkin, Mr. Gebhart, and other witnesses; viz., that cattle exposed in Islington Market should not be allowed to be removed for exposure in any other market. For this purpose, they proposed that all animals, on arriving at Islington, should be marked for slaughter, and that the making use of such mark in other places, or the exposure in any other market of an animal so marked, should be prohibited under severe penalties. It was shown that this market is the hot-bed of various diseases, more especially that the lairs are tainted with the foot-and-mouth disease, and that it is the practice of small jobbers to buy fat beasts in this market in order to remove them for re-sale to some local market, where they are necessarily brought into contact with both fat and store stock, and thus become the means of setting up fresh sources of contagion in various parts of the country. These jobbers would no doubt be affected by the restriction proposed, but no loss would fall on either the producer or the consumer, and your Committee have no hesitation in recommending the change as one of considerable value.

36. In connection with this part of the subject, the attention of your Committee was also directed to the prevalence of disease in the dairy sheds in the metropolis and large towns, and the great danger of contagion being carried from them into the markets, and thus spread throughout the country. The evidence showed the constantly-changing nature of the trade, that cows are sent into the markets on showing the least symptom of being affected, and their places filled by fresh stock. The danger from these sheds was strikingly proved by the last outbreak of cattle plague in London.

Much evidence was also given as to the feasibility of superseding town dairies by milk from the country. It was proved that by far the larger part of the present supply of London was brought from dairy farms established for the purpose, often at a considerable distance from town; nor is there any reason to suppose that the milk thus supplied is inferior in quality. Mr. Tisdall, who appeared on the part of the Dairy Association, stated that there was no difference in the quality or the price of the milk produced as between his dairy at Epsom and his cow-shed in London, and admitted that the metropolitan supply from the country dairies arrived in perfect condition. From his evidence your Committee were also led to believe that the Dairy Association were well aware of the dangers of infection from their town sheds, and were willing to submit to regulations and inspection. On the whole, notwithstanding much evidence against the continuance of dairy-sheds in large towns, your Committee are of opinion that if registration, a real inspection, and sufficient regulations as to the movement of animals to and from these places are enforced, they may be allowed to remain without danger to the public.

37. Your Committee have already alluded to the necessity which, in the event of the same regulations not being adopted in the three parts of the kingdom, would arise for defining ports in Great Britain, where alone animals from Ireland or the Channel Islands would be allowed to be imported by sea, and where they would be examined by an inspector before being suffered to pass inland. The evidence of Lord Fitzhardinge and Mr. Peters showed that it has

has occurred that infected animals from Ireland have been landed at a British port where there is no provision for inspection, and have been then driven through healthy districts to the various markets, and thus distributed throughout the country. Such a system your Committee feel could not be permitted to continue if, with a view to stamp out the diseases, Great Britain was subjected to regulations controlling the movement of home stock, and adding permanently to the number of scheduled countries. And your Committee think it to be their duty, in view of the evidence which they have received, to recommend that a searching inquiry should be made into the subject of the transit of cattle from Ireland to the ports of Great Britain; into the provisions made for their reception at the ports of departure and of arrival, and into their treatment during the voyage.

38. In conclusion, your Committee recommend as follows:—

1. That as a statutory arrangement the importation of all animals from Russia, and of cattle from Germany (except Schleswig-Holstein) and Belgium, be prohibited, whilst that of other animals from these last two countries, and of all animals from the rest of Europe, should be subject to the provisions of the same schedule; power being reserved to the Privy Council to prohibit the importation of animals from other countries if they think fit. An exception, however, should be made in favour of store and dairy animals, provided they remain in quarantine for 14 days, and afterwards are placed under inspection for two months.

2. That the Privy Council should be empowered to deal directly with the cattle plague whenever it appears in this country, and that for this purpose it should receive from the local authority immediate notice of every outbreak.

3. That the power to order the slaughter of animals suspected of cattle plague should extend to animals in premises adjoining to the infected premises.

4. That whilst the compensation for the slaughter of animals affected by cattle plague should remain as it is at present, the compensation for the slaughter of animals suspected of that disease should be the full value (not however exceeding 40 *l.*).

5. That all compensation for the animals so slaughtered, whether diseased or suspected, should be defrayed from imperial funds.

6. That in case of pleuro-pneumonia or foot-and-mouth disease breaking out, the Privy Council should have power to fix the limits of the district which is to be treated as infected.

7. That uniform rules applicable to all districts declared infected should be issued by the Privy Council, but should be enforced by the local authority, subject to the supervision of the Privy Council.

8. That, in the case of pleuro-pneumonia, the compensation for the slaughter of animals, whether suspected or diseased, should be at the same rate as in the case of cattle plague, but should be payable out of local funds.

9. That stock exposed in Islington Market should not be allowed to leave the metropolitan district alive.

10. That, in the metropolis and large towns, dairy and cattle sheds should be subject to registration, inspection, and regulations.

11. That the restrictions applicable to Great Britain should be extended to Ireland and the Channel Islands, or else that ports should be specified in Great Britain by the Privy Council, to which alone importation of live animals from Ireland and the Channel Islands should be lawful, the animals not being permitted to be taken inland unless examined and passed by a Privy Council inspector at the port of debarkation.

12. And your Committee are of opinion that no further restrictions should be placed on the importation of foreign animals in respect to foot-

and-mouth disease and pleuro-pneumonia, unless at the same time orders be enforced throughout Great Britain, that in every district where either pleuro-pneumonia or foot-and-mouth disease exists, and which has been declared by the Privy Council to be infected, all movement of cattle be prohibited except under license; that fairs and markets be under similar restrictions, and that absolute prohibition of movement be enforced against infected farms for periods varying from two months in pleuro-pneumonia, to 28 days in outbreaks of foot-and-mouth disease.

13. That where required effect should be given by the Legislature to these recommendations.

25 *July* 1877.

PROCEEDINGS OF THE COMMITTEE.

Tuesday, 8*th May* 1877.

MEMBERS PRESENT:

Sir Henry Selwin Ibbetson.	Mr. Elliot.
Mr. James Corry.	Colonel Kingscote.
Sir George Jenkinson.	Sir Rainald Knightley.
Mr. M'Lagan.	Mr. King-Harman.
Mr. Arthur Peel.	Mr. French.
Mr. Chamberlain.	Mr. Torr.
Mr. John Holms.	Mr. Murphy.
Mr. Anderson.	Mr. Wilbraham Egerton.
Mr. William Edward Forster.	Major Allen.

Sir HENRY SELWIN IBBETSON was called to the Chair.

The Committee deliberated.

[Adjourned till Friday next, at Twelve o'clock.

Friday, 11*th May* 1877.

MEMBERS PRESENT:

Sir HENRY SELWIN IBBETSON in the Chair.

Mr. Pease.	Mr. Arthur Peel.
Colonel Kingscote.	Mr. Wilbraham Egerton.
Mr. M'Lagan.	Sir Rainald Knightley.
Mr. William Edward Forster.	Mr. Elliot.
Mr. Chamberlain.	Mr. Cameron of Lochiel.
Mr. Jacob Bright.	Mr. John Holms.
Mr. King-Harman.	Mr. Chaplin.
Mr. James Corry.	Mr. Norwood.
Mr. Anderson.	Major Allen.
Mr. Assheton.	Mr. Dease.
Mr. French.	Sir George Jenkinson.
Mr. Torr.	

Professor *George Thomas Brown* was examined.

[Adjourned till Tuesday next, at Twelve o'clock.

Tuesday, 15*th May* 1877.

MEMBERS PRESENT:

Sir HENRY SELWIN IBBETSON in the Chair.

Mr. William Edward Forster.	Mr. Assheton.
Mr. Jacob Bright.	Mr. Anderson.
Major Allen.	Mr. Chaplin.
Mr. Arthur Peel.	Mr. Ritchie.
Colonel Kingscote.	Mr. Norwood.
Mr. French.	Sir Rainald Knightley.
Mr. Elliot.	Sir George Jenkinson.
Mr. Wilbraham Egerton.	Mr. Cameron of Lochiel.
Mr. Pease.	Mr. James Corry.
Mr. Torr.	

Count *C. F. Danneskcild-Samsoe* was examined.

Professor *George Thomas Brown* was further examined.

[Adjourned till Thursday next, at Twelve o'clock.

Thursday, 17th May 1877.

MEMBERS PRESENT:

Sir HENRY SELWIN IBBETSON in the Chair.

Mr. Chaplin.	Mr. Assheton.
Major Allen.	Mr. Jacob Bright.
Mr. Arthur Peel.	Mr. Chamberlain.
Colonel Kingscote.	Sir Rainald Knightley.
Sir George Jenkinson.	Mr. Norwood.
Mr. Torr.	

Professor *George Thomas Brown* was further examined.

Professor *James Beart Simonds* was examined.

[Adjourned till Monday, 4th June, at Twelve o'clock.

Monday, 4th June 1877.

MEMBERS PRESENT:

Sir HENRY SELWIN IBBETSON in the Chair.

Mr. Assheton.	Sir Rainald Knightley.
Mr. Arthur Peel.	Mr. Pease.
Colonel Kingscote.	Mr. Ritchie.
Mr. Chaplin.	Mr. M'Lagan.
Mr. Jacob Bright.	Mr. Torr.
Mr. Elliot.	Mr. Anderson.
Mr. William Edward Forster.	Mr. John Holms.
Mr. James Corry.	Mr. Chamberlain.

Professor *Charles Müller* and Mr. *Thomas Swan* were examined.

[Adjourned till Wednesday next, at Twelve o'clock.

Wednesday, 6th June 1877.

MEMBERS PRESENT:

Sir HENRY SELWIN IBBETSON in the Chair.

Mr. Chaplin.	Mr. James Corry.
Mr. Arthur Peel.	Mr. M'Lagan.
Colonel Kingscote.	Mr. Torr.
Mr. John Holms.	Mr. Wilbraham Egerton.
Mr. Anderson.	Mr. French.
Mr. Assheton.	Mr. Chamberlain.
Mr. Elliot.	Mr. Murphy.
Mr. Norwood.	Sir Rainald Knightley.
Mr. William Edward Forster.	Mr. Pease.

Mr. *Mark Whitwill* and Mr. *John William May* were examined.

Mr. *G. A. Thommsen*, was examined through an interpreter.

Mr. *Thomas Christopher Booth* was examined.

[Adjourned till Friday next, at Twelve o'clock.

Friday, 8*th June* 1877.

MEMBERS PRESENT

Sir HENRY SELWIN IBBETSON in the Chair.

Sir William Edward Forster.	Mr. Wilbraham Egerton.
Mr. Assheton.	Mr. M'Lagan.

Mr. John Holms.	Mr. Norwood.
Mr. Chaplin.	Mr. Pease.

The Baron *Fr. Von Behr*, Mr. *Charles Lennox Peel*, Mr. *Murillo H. Gillett*, Mr. *Richard Hall*, and Mr. *John David Link*, were examined.

[Adjourned till Monday next, at Twelve o'clock.

Monday, 11*th June* 1877.

MEMBERS PRESENT:

Sir HENRY SELWIN-IBBETSON in the Chair.

Mr. Arthur Peel.	Mr. Cameron of Lochiel.
Colonel Kingscote.	Mr. Chaplin.
Mr. Anderson.	Mr. French.
Mr. John Holms.	Mr. Chamberlain.
Mr. Norwood.	Mr. Ritchie.
Mr. Assheton.	Mr. Wilbraham Egerton.
Mr. Torr.	Mr. Murphy.
Mr. M'Lagan.	Mr. William Edward Forster.
Mr. Jacob Bright.	Sir Rainald Knightley.
Mr. Elliot.	Mr. Pease.
Mr. King-Harman.	

Mr. *Alfred Lyon* and Mr. *George Rea* were examined.

[Adjourned till Wednesday next, at Twelve o'clock

Wendesday, 13*th June* 1877.

MEMBERS PRESENT:

Sir HENRY SELWIN IBBETSON in the Chair.

Mr. Arthur Peel.	Mr. Dease.
Colonel Kingscote.	Mr. French.
Mr. John Holms.	Mr. Cameron of Lochiel.
Mr. Assheton.	Mr. King-Harman.
Mr. Elliot.	Mr. Norwood.
Mr. M'Lagan.	Mr. Jacob Bright.
Major Allen.	Mr. Torr.
Mr. James Corry.	Mr. Chamberlain.
Mr. William Edward Forster.	Mr. Ritchie.
Mr. Anderson.	Mr. Murphy.

Mr. *Charles Lennox Peel* was further examined.

Mr. *Septimus Lambert*, Mr. *Archibald Hamilton*, and Mr. *John Prince Sheldon* were examined.

[Adjourned till Friday next, at Twelve o'clock.

Friday, 15*th June* 1877.

MEMBERS PRESENT:

Sir HENRY SELWIN IBBETSON in the Chair.

Major Allen.
Colonel Kingscote.
Mr. James Corry.
Mr. Elliot.
Mr. M'Lagan.
Mr. Anderson.
Mr. Cameron of Lochiel.
Mr. Torr.
Mr. Assheton.
Mr. Dease.
Mr. Norwood.
Mr. French.
Mr. King-Harman.
Mr. Murphy.
Mr. Chamberlain.
Mr. Wilbraham Egerton.
Sir Rainald Knightley.
Sir George Jenkinson.
Mr. Jacob Bright.
Mr. William Edward Forster.
Mr. Arthur Peel.

Mr. *Jacob Wilson* and Mr. *Herman Gebhardt* were examined.

[Adjourned till Monday next, at Twelve o'clock.

Monday, 18*th June* 1877.

MEMBERS PRESENT:

Sir HENRY SELWIN IBBETSON in the Chair.

Mr. William Edward Forster.
Major Allen.
Mr. Chaplin.
Colonel Kingscote.
Mr. Anderson.
Mr. John Holms.
Mr. Jacob Bright.
Mr. Mundella.
Mr. Elliot.
Mr. Assheton.
Sir George Jenkinson.
Mr. Arthur Peel.
Mr. M'Lagan.
Mr. Wilbraham Egerton.
Mr. Torr.
Mr. King-Harman.
Mr. Ritchie.
Mr. French.
Mr. Dease.
Mr. Norwood.
Sir Rainald Knightley.
Mr. Murphy.

The Right Honourable Lord *FitzHardinge* (attending by permission of the House of Lords), and Mr. *James Peters* were examined.

Mr. *Herman Gebhardt* was further examined.

[Adjourned till Wednesday next, at Twelve o'clock.

Wednesday, 20*th June* 1877.

MEMBERS PRESENT:

Sir HENRY SELWIN IBBETSON in the Chair.

Major Allen.
Mr. Arthur Peel.

Mr. Chamberlain.	Mr. Murphy.
Mr. William Edward Forster.	Mr. Norwood.

DRAFT REPORT proposed by the Chairman, read the first time, as follows:—

"YOUR Committee have examined witnesses from the Privy Council Department and representatives of the different trades affected, as well as of the agricultural interest, and have taken much evidence as to the dead meat trade recently established with America, and the supply of food to the manufacturing towns.

"2. They have had before them the evidence taken upon this subject by the Committee of 1873, and their Report.

"3. Your Committee will first consider the question of cattle plague.

"4. They have carefully gone into the causes of the recent outbreak, and have ascertained that the disease was imported by animals arriving from Hamburg before the authorities here had any official intimation of the outbreak at that place. They are glad to be able to report that they are satisfied by the evidence that, with proper regulations, cattle plague might be stamped out in a short time, and that no ground really exists for the fear of its becoming as destructive as it was in 1865. But the existing provisions, whether for its prevention or for its suppression, require considerable improvement.

"5. With respect to the introduction of disease into this kingdom, serious difficulties must always surround the importation of cattle from abroad, especially from a country like Germany, with a long exposed frontier. In such a case no measures short of prohibition would give the necessary security; whilst as to other countries the evidence leaves no doubt as to the necessity of foreign Governments imposing stricter regulations on their export trade in live stock, and especially providing that notice of any outbreak of cattle plague shall be forthwith communicated by telegraph to the authorities of this country. These are matters which should be made the subject of international arrangement.

"6. With regard to home arrangements, the recent outbreak in this country suffices to prove that the system under which the powers of dealing with disease are, in the first instance, committed to the local authority, does not work satisfactorily, and that the powers of the Privy Council, which at present do not arise until the failure of the action of the local authority, should, in every instance, be exercised at the earliest moment, and that, with this view, it should be the duty of the local authority at once to inform the Privy Council of any outbreak of the malady.

"7. That the power to order the slaughter of suspected animals should extend to animals on premises adjoining to those actually infected seems as necessary to your Committe, as it did to the Committee of 1873.

"8. Your Committee are also of opinion that further inducement should be held out to farmers to report the first appearance of the cattle plague amongst their stock. At present, whilst one-half of the value is paid as compensation for any animal actually diseased, only three-quarters is allowed for an animal slaughtered on suspicion. Your Committee consider that in the latter case the full value should be paid, subject only to a maximum of 40*l.*

"9. Lastly, your Committee recommend that all compensation for the slaughter of animals on account of cattle plague, whether such animals are actually diseased or only suspected, should in future be defrayed out of imperial and not, as now, out of local funds. This change in the incidence of the charge is almost a necessary consequence of the change previously recommended, under which the order for slaughter will, in all cases, proceed from the central instead of the local authority; but apart from this it appears justified by considerations of public expediency. The rapidity with which cattle plague, if left unchecked, spreads far and wide makes it a matter of general concern that measures should be immediately taken for its suppression. Experience has shown that it can with certainty be suppressed by the slaughter of all animals within the zone of suspicion, and by no other course; and further, that if the case is promptly dealt with, the limits of this zone are comparatively narrow. The order for the necessary slaughter is therefore one which should be made without hesitation, and any compensation which in consequence becomes payable may be deemed a cheap insurance against what would otherwise become a national misfortune.

"10. But cattle plague is not the only question. It was abundantly proved in evidence that the ravages of cattle plague and the diminution of the breeding herds of the kingdom from the fear of breaking out of cattle plague are as nothing compared with the losses inflicted and the enterprise checked by pleuro-pneumonia and foot-and-mouth complaint. In addition to the losses to the community of animals actually destroyed by either of those diseases, or slaughtered to prevent the spread of pleuro-pneumonia, the agricultural witnesses laid great stress on the fact, that whatever loss fell upon the farmer from the deterioration of his stock through foot-and-mouth complaint, reacted injuriously on the consumer, by the diminution in the number of fat stock which the farmer was able to place on the market in a given time.

"11. One witness, it is true, Mr. Gebhart, questioned the capability of the grazing lands of the country to support herds much larger than those which now exist, but in this view he stood alone. Witnesses with practical experience like Mr. Booth, Mr. Read, Mr. Jacob Wilson, Mr. James Howard, Mr. Adam Smith, and the President of the Scotch

Scotch Chamber of Commerce, Mr. Melvin, all agreed that if immunity from these two scourges were assured beforehand, such an increase might be anticipated in the breeding herds as would in the course of a certain time be large enough to make up for whatever diminution of supply might be occasioned by any new restrictions on the import from foreign countries.

" 12. Both these diseases are attributed to foreign origin; at all events, it was admitted that they are widely prevalent in many of the countries from which importation now takes place; and the number of cargoes stopped at the ports on account of disease having been actually discovered in the animals when landed, justifies the opinion that in many other cases animals really contagious are passed by the inspectors at the ports, owing to the length of the voyage having been too short to allow the malady to develop to that stage where it is open to detection. This is more especially the case in pleuro-pneumonia, which has often been known to lie dormant for periods varying from two to three months.

" 13. If, however, it was proved how inseparable from the importation of foreign cattle is the risk of the introduction of these two diseases, it was shown beyond a doubt that at the present moment they both exist so largely in this country, that unless further restrictions are applied to the movements of our home stock, no restrictions on the foreign trade can give the least hope of the eradication of these diseases which is the necessary condition of any adequate development of the home supply. In fact, it was admitted by every witness, that if these diseases are to be stamped out, both kinds of restrictions were equally indispensable.

" 14. In the opinion, therefore, of your Committee, the first matter to be decided really is, whether the farmers of this country are prepared to submit to the inconvenience of such home regulations as may be found to be requisite. Should this be the case, then, and then only, would arise the further question as to whether new restrictions should be placed on the foreign import.

" 15. Adopting this order, your Committee proceed to consider the home regulations which the various witnesses insisted upon as necessary.

" 16. On this point Professor Brown expressed a very strong opinion, that whether for the purpose of dealing with cattle plague, should it arise, or of stamping out pleuro-pneumonia and foot-and-mouth disease, one of the most important amendments of the existing system would be the establishment of uniform regulations applicable to the whole country, such regulations to be issued by the Privy Council, and to be carried out by Privy Council inspectors stationed in each district.

" 17. So far as relates to the necessity of uniform rules to be issued by the central authority, Professor Brown's views were strongly supported by Lord Fitzhardinge, Mr. Rea, Mr. Wilson, Mr. Stratton, Mr. Adam Smith, Mr. Melvin, Mr. Soulby, and Mr. Clare Sewell Read, on the part of the agricultural interests; by Mr. Tisdall, representing the Dairymen's Society; by Mr. Giblett and Mr. Lambert, two salesmen; and by Mr. P. Rudkin, on the part of the market authority of the City of London. And the evils of the present want of uniformity were forcibly illustrated by Mr. Wilson's description of the different regulations which had recently prevailed at the meeting point of the districts of three local authorities at Newcastle.

" 18. But when it came to that part of the suggestion which placed the appointment of the local inspectors in the central authority, the witnesses were not so unanimous. Lord Fitzhardinge, Mr. Rea, Mr. Wilson, Mr. Adam Smith, Mr. Tisdall, and Mr. Stratton were of opinion that if, as they suggested, the central authority were to make regulations for the whole of the country, the central authority should also, in order to ensure their regulations being carried out, have the nomination of the inspectors. On the other hand, Mr. Melvin recommended that the localities should appoint their own inspectors as now, but that the Privy Council should have a travelling staff to see that these local inspectors properly carried out the rules, just as inspectors of the Local Government Board supervise the action of the local poor law authorities. Mr. C. Read supported the latter view, with the qualification that all local authorities in the same county should be united for the purpose of appointing inspectors, whilst Mr. James Howard and Mr. Soulby urged that the police, responsible as they are to quarter sessions in counties and to town councils in boroughs, are sufficient to carry out any regulations, subject only to the intervention of the Privy Council in the case of a serious outbreak.

" 19. Your Committee are of opinion that the Privy Council could not undertake the work of local inspection throughout the kingdom, and agree with Mr. Melvin that the appointment of inspectors should rest with the local authority, subject to the supervision of the Privy Council.

" 20. But whatever difference of opinion existed as to the authority which should enforce the regulations, it was admitted that farmers would find themselves under a much stricter *régime* than that which has hitherto been in operation, inasmuch as in every district where either pleuro-pneumonia or foot-and-mouth disease existed all movement of cattle would be prohibited except under license; fairs and markets would be under similar restrictions, and absolute prohibition of movement would be enforced against infected farms for periods

varying from two months in pleuro-pneumonia to 28 days in outbreaks of foot-and-mouth disease. Further, the same regulations would have to be extended to Scotland and Ireland, or else animals brought by sea from those parts of the kingdom should not be permitted to be landed except at defined ports, where provision was made for subjecting them to proper inspection.

"21. Upon the question whether such restrictions would be accepted, Professor Brown stated his own opinion to be that as these restrictions must be expected to last for a considerable period before the diseases could be stamped out, the country would not endure them, and would prefer the continuance of the diseases to such a cure. Professor Brown, however, admitted that this opinion was not in accordance with what he had been informed were the views of agriculturists; and as a fact, with the one exception of Mr. Soulby, all the agricultural witnesses who appeared before your Committee—and many of them spoke as representatives of large bodies of farmers in various parts of the country—expressed themselves with confidence that, provided there was an assurance against the re-introduction of disease from abroad, these home regulations would be willingly accepted by the farmers of the country.

"22. And your Committee with this evidence before them can hardly resist the conclusion that such would be the case.

"23. In the belief then that such regulations as have been indicated would be accepted by the home trade, your Committee pass to the question as to what additional restrictions to the foreign trade would have to be combined with such home regulations in order to give the requisite security.

"24. The inspection at the ports being admittedly insufficient as a protection against pleuro-pneumonia, and uncertain even in the case of foot-and-mouth complaint, some witnesses advocated the total prohibition of live animals from abroad, suggesting their slaughter at the port of embarkation. But the greater number of the agricultural witnesses, including Mr. Odams, Mr. James Howard, Mr. Melvin, and Mr. Clare Read, admitted the difficulties of such a course, considering that the country was not prepared for so complete a change, and that the result might be to drive the foreign supply into other markets. They therefore preferred to advise the compulsory slaughter of imported animals at the port of debarkation, all countries, with the exception perhaps of America, being thus treated as scheduled countries are at the present moment.

"25. A third proposal which was brought before your Committee was, that on the one hand, so far as regards Belgium and Germany, the importation from those countries of live cattle should be absolutely prohibited, and of live sheep should be allowed only on the condition that they should be slaughtered at the port of debarkation; and that, on the other, as to unscheduled countries, such as Spain, Portugal, and Denmark now are, all animals coming from there should be freely admitted into our ports and allowed to pass inland, provided only that the Privy Council were satisfied with the precautionary regulations in force in such countries.

"26. This suggestion as to the prohibition of the importation of cattle from Germany and Belgium, was founded on the extreme uncertainty of obtaining timely information here of any outbreak of disease in Germany, and on the consideration that Belgium is a transit country for German cattle. On the other hand, the proposal to continue the freedom of importation from countries now unscheduled, was justified by the evidence of many witnesses, as well as the official returns of our imports, showing that these countries practically enjoy immunity from disease. At the same time, inasmuch as the English authorities can exercise no direct control over the safeguards to be taken in foreign territory, it seems to your Committee expedient that power should be reserved to the Privy Council in case of the outbreak of any contagious disease, or in the event of the safeguards provided being insufficient, to bring any of these countries under the schedule for so long a period as may be necessary.

"27. On the whole, after considering the various alternatives, your Committee would recommend that from Sweden and Norway, Denmark, Spain, Portugal, and America, importation should be permitted as now, subject only to inspection at the port of debarkation; but that any of these countries should on the outbreak therein of any contagious or infectious disease be liable to be placed temporarily by Order in Council in the list of scheduled countries; and that as a statutory arrangement the importation of cattle from Russia, Germany (with the exception of Schleswig-Holstein), and Belgium, should be prohibited, whilst these countries as to other animals, and the rest of Europe as to all animals, should be permanently added to the list of scheduled countries.

"28. Your Committee believe that these combined restrictions at the ports and inland, would succeed in stamping out these diseases, and assuming this to be the case, the great question would still remain how far the result would affect the supply of meat to the country, especially to large manufacturing towns.

"29. It was acknowledged that to bring about such an increase in the home supply as the witnesses anticipated from the greater security against these complaints, must take time; and the foreign importers and salesmen who opposed these restrictions asserted, as they did in 1873, that any considerable addition to the number of scheduled countries would

would drive the foreign trade to other markets, and thus not only reduce the supply and make meat dearer, but in the interval before the promised increase in the home stock had been realised, raise the price of meat to famine rates in many of our inland towns.

"30. On the other hand, many practical witnesses assured your Committee that instead of diminishing and driving away the supply, the extension of any fixed rule rendering slaughter at the port compulsory, would really increase the number and the quality of the animals sent. They pointed out that the present regulations are not favourable to the exporter. The fact that if on the arrival of his cargo at the port of debarkation disease is detected he has to re-ship his animals and take them on to Deptford, or some other port for immediate slaughter, renders him at all times uncertain of his market, and frequently puts him to much expense. The same causes operate injuriously to Deptford Market itself. The supply to that market mainly comes either from countries temporarily scheduled, *i. e.*, countries from which cattle cannot be imported, except into a port where provision is made for their immediate slaughter, or else from casual cargoes which were originally consigned to other ports, but which on account of infection having broken out it has been necessary to bring on to Deptford for slaughter. The supply, therefore, is uncertain from day to day; buyers in consequence are not attracted, and from the want competition prices rule low. If on the other hand, by the addition to the number of scheduled countries, the cases were multiplied in which foreign animals are to be slaughtered on their arrival in port, it was confidently asserted that a steady trade would arise, and competition be the same as at Islington Market; and in confirmation of this view it was shown that during the recent period of restrictions large supplies had been sent over with the full knowledge that the animals would be slaughtered at the port.

"31. It was next objected, that even if the number of animals sent to this country was not diminished by an extension of the law requiring slaughter at the ports, the difficulties of carrying the animals from those ports as dead meat to the inland towns would in hot weather be so great as to deprive those towns of much of their present supply, more particularly in foreign sheep; and the butchers from northern towns especially urged that their trade could not be carried on unless they were able as now to take the live animals from the port of debarkation to their own slaughter-houses, there to be killed as wanted for their customers.

"32. But the evidence given by Mr. Rudkin, strengthened as it was by that of the deputy chairman of the Great Western Railway, Sir Alexander Wood, and other witnesses, conclusively proved that these fears are without foundation, that there is no real difficulty in the supply of dead meat, and with proper arrangements, even of offal to these towns, and that for some time a dead meat trade, especially in sheep, has been regularly carried on from the Deptford Market all over the country, increasing since the restrictions were enforced. Dead sheep have been also sent in large numbers to Wales, not unfrequently coming back to London as Welch mutton. And the fact that the Aberdeen supply of dead meat to the London market has of late largely increased (reaching an average of from 60 to 70 tons a day, even in hot weather), affords additional evidence in this direction.

"33. Having, then, carefully considered the evidence, your Committee have arrived at the conclusion that compulsory slaughter, at the port of debarkation, to the extent they have recommended, is not likely either to discourage foreign importation, or to diminish the supply of our large towns, or generally to raise the price of meat.

"34. With regard to the importation of dead meat from America, as affecting this question, the evidence shows that there are no limits to the amount of meat which can be imported from that country; that in cool weather the meat can with no difficulty be delivered here in perfect order, and that with greater care in the packing, and with better arrangements for storage here, it could be brought over in the hottest months. American meat already forms a useful supplementary supply to the meat markets of this country, and in no very distant future will probably constitute a most important addition, and will materially aid the carrying out of such a system as your Committee have suggested above. But the trade is at present in too uncertain and experimental a condition to justify reliance upon it for an unfailing supply.

"35. Another important recommendation which was suggested for checking the spread of these diseases was made by Mr. Rudkin, Mr. Gebhart, and other witnesses; viz., that fat cattle exposed in Islington Market should not be allowed to be removed for exposure in any other market. For this purpose, they proposed that all animals, on arriving at Islington, should be branded for slaughter, and that the making use of such brand in other places, or the exposure in any other market of an animal so branded, should be prohibited under severe penalties. It was shown that this market is the hot-bed of various diseases, more especially that the lairs are tainted with the foot-and-mouth disease, and that it is the practice of small jobbers to buy fat beasts in this market in order to remove them for re-sale to some local market, where they are necessarily brought into contact with both fat and store stock, and thus become the means of setting up fresh sources of contagion in various parts of the country. These jobbers would no doubt be affected by the restriction proposed, but no loss would fall on either the producer or the consumer, and your Committee have no hesitation in recommending the change as one of considerable value.

"36. In connection with this part of the subject, the attention of your Committee was also directed to the prevalence of disease in the dairy sheds in the metropolis and large towns, and the great danger of contagion being carried from them into the markets, and thus spread throughout the country. The evidence showed the constantly-changing nature of the trade, that cows are sent into the markets on showing the least sympton of being affected, and their places filled by fresh stock. The danger from these sheds was strikingly proved by the last outbreak of cattle plague in London.

Much evidence was also given as to the feasibility of superseding town dairies by milk from the country. It was proved that the larger part of the present supply of London was brought from dairy farms established for the purpose, often at a considerable distance from town; nor is there any reason to suppose that the milk thus supplied is inferior in quality. Mr. Tisdall, who appeared on the part of the Dairy Association, stated that there was no difference in the quality or the price of the milk produced as between his dairy at Epsom and his cow-shed in London itself, and admitted that the metropolitan supply from the Aylesbury and other dairies arrived in perfect condition. From his evidence your Committee were also led to believe that the Dairy Association were well aware of the dangers of infection from their town sheds, and were willing to submit to regulations and inspection. On the whole, notwithstanding much evidence against the continuance of dairy sheds in large towns, your Committee are of opinion that if a real inspection, and sufficient regulations as to the movement of animals to and from these places are enforced, they may be allowed to remain without danger to the public.

"37. Your Committee have already alluded to the necessity which, in the event of the same regulations not being adopted in the three parts of the kingdom, would arise for defining ports in England where alone animals from Scotland or Ireland would be allowed to be imported by sea, and where they would be examined by an inspector before being suffered to pass inland. The evidence of Lord Fitzhardinge and Mr. Peters showed that at present it often occurs that infected animals from Ireland are landed at an English port where there is no provision for inspection, and are then driven through healthy districts to the various markets, and thus distributed throughout the country. Such a system your Committee feel could not be permitted to continue if, with a view to stamp out the diseases, England was subjected to regulations controlling the movement of home stock, and adding permanently to the number of scheduled countries.

"38. In conclusion, your Committee recommend as follows:—

"A.—With respect to cattle plague:

"1. That the Privy Council should be empowered to deal directly with the cattle plague whenever it appears in this country, and that for this purpose it should receive from the local authority immediate notice of every outbreak.

"2. That the power to order the slaughter of suspected animals should extend to animals in premises adjoining to the infected premises.

"3. That whilst the compensation for the slaughter of diseased animals should remain as it is at present, the compensation for the slaughter of suspected animals should be the full value (not however exceeding 40 *l.*).

"4. That all compensation for the slaughtered animals, whether diseased or suspected, should be defrayed from Imperial funds.

"B.—As to pleuro-pneumonia and foot-and-mouth diseases:

"5. That Sweden and Norway, Denmark, Spain, Portugal, and America, or any of them, should, on the outbreak therein of any contagious disease, be liable to be placed temporarily in the list of scheduled countries. That as a statutory arrangement the importation of cattle from Russia, Germany (except Schleswig-Holstein), and Belgium be prohibited, whilst that of other animals from those countries, and of all animals from the rest of Europe, should be subject to the provisions of the same schedule.

"6. That in cases of pleuro-pneumonia or foot-and-mouth disease breaking out, the Privy Council should have power to fix the limits of the district which is to be treated as infected.

"7. That uniform rules applicable to all districts declared infected should be issued by the Privy Council, but should be enforced by the local authority, subject to the supervision of the Privy Council.

"8. That, in the case of pleuro-pneumonia, the compensation for the slaughter of animals, whether suspected or diseased, should be at the same rate as in the case of cattle plague, but should be payable out of local funds.

"9. That fat stock exposed in Islington Market should not be allowed to be removed for exposure in any other market.

"10. That, in the metropolis and large towns, dairy sheds should be subject to inspection and regulations.

"11. That the restrictions applicable to England should be extended to Scotland

Scotland and Ireland, or else that ports should be specified in England to which alone importation of live animals from Scotland or Ireland should be lawful, the animals not being permitted to be taken inland unless examined and passed by a Privy Council inspector at the port of debarkation.

"12. That effect should be given by the Legislature to these recommendations."

DRAFT REPORT proposed by the *Chairman*, read a second time, paragraph by paragraph.

Paragraph 1, *agreed to.*

Paragraph 2.—Amendment proposed at the end of the paragraph, to add the words, "and, after careful investigation, they agree with the recommendation in that Report, that no change should be made in the Contagious Diseases (Animals) Act, 1869, so far as it relates to the importation of foreign animals"—(Mr. *William Edward Forster*).—Question put, That those words be there added.—The Committee divided:

Paragraphs 18–19, *agreed to*.

Paragraph 20, amended, and *agreed to*.

Paragraphs 21–25, *agreed to*.

Paragraph 26, *postponed*.

[Adjourned till To-morrow, at Twelve o'clock.

Tuesday, 24th July 1877.

MEMBERS PRESENT:

Sir HENRY SELWIN IBBETSON, in the Chair.

Mr. Torr.	Mr. William Edward Forster.
Major Allen.	Mr. Anderson.
Mr. Pease.	Mr. Cameron of Lochiel.
Mr. John Holms.	Mr. Norwood.
Mr. Elliot.	Mr. Dease.
Mr. French.	Sir Rainald Knightley.
Mr. Wilbraham Egerton.	Mr. Murphy.
Mr. Arthur Peel.	Sir George Jenkinson.
Mr. Assheton.	Mr. Chamberlain.
Mr. Ritchie.	Mr. King-Harman.
Mr. Chaplin.	Mr. Mundella.
Colonel Kingscote.	Mr. M'Lagan.

Paragraph 27.—Amendment proposed, in line 2, to leave out from the word "recommend" to the end of the paragraph, in order to insert the words: "The compulsory slaughter at the port of debarkation of all animals, imported for the purposes of food, from foreign countries (except Canada and the United States of America) not declared to be infected with cattle plague. The Privy Council, as at present, to have power to prohibit importation from any country during the period it is declared to be so infected"—(Mr. *Norwood*).—Question put, That the word "that" stand part of the paragraph.—The Committee divided:

Ayes, 18.	Noes, 3.
Major Allen.	Mr. Assheton.
Mr. Anderson.	Mr. Pease.
Mr. Cameron of Lochiel.	Mr. Ritchie.
Mr. Chamberlain.	
Mr. Chaplin.	
Mr. Dease.	
Mr. Wilbraham Egerton.	
Mr. Elliot.	
Mr. William Edward Forster.	
Mr. French.	
Mr. John Holms.	
Sir George Jenkinson.	
Colonel Kingscote.	
Sir Rainald Knightley.	
Mr. Murphy.	
Mr. Pease.	
Mr. Arthur Peel.	
Mr. Torr.	

Another Amendment proposed, in line 2, to leave out from the word "that" to the end of the paragraph, in order to add the words: "As a statutory arrangement, the

importation of cattle from Russia, Germany (with the exception of Schleswig-Holstein and Belgium, should be prohibited, and that all these countries as to other animals, and the rest of Europe as to all animals, should be permanently added to the list of scheduled countries.

"And all fat cattle imported therefrom should be slaughtered at the port, such ports being defined, of debarkation; and that all store or dairy cattle should be quarantined for 14 days at certain defined ports of landing. Such stock, on removal, to be registered as to where sent, and there to be under restraint and immovable for two months"—(Mr. *Elliot*).

Question put, That the words "From Sweden and Norway" stand part of the paragraph.—The Committee divided:

Ayes, 8.	Noes, 15.
Mr. Anderson.	Major Allen.
Mr. Chamberlain.	Mr. Assheton.
Mr. William Edward Forster.	Mr. Cameron of Lochiel.
Mr. John Holms.	Mr. Chaplin.
Mr. Mundella.	Mr. Dease.
Mr. Pease.	Mr. Wilbraham Egerton.
Mr. Arthur Peel.	Mr. Elliot.
Mr. Ritchie.	Mr. French.
	Sir George Jenkinson.
	Mr. King-Harman.
	Colonel Kingscote.
	Sir Rainald Knightley.
	Mr. Murphy.
	Mr. Norwood.
	Mr. Torr.

Question proposed, That the proposed words be added instead thereof.—Amendment proposed to the proposed Amendment to leave out the first words, "as a statutory arrangement," in order to insert the words "discretion of the Privy Council"—(Mr. *Anderson*).—Question put, That the words proposed to be left out stand part of the proposed Amendment.—The Committee divided:

Ayes, 15.	Noes, 8.
Major Allen.	Mr. Anderson.
Mr. Assheton.	Mr. Chamberlain.
Mr. Cameron of Lochiel.	Mr. William Edward Forster.
Mr. Chaplin.	Mr. John Holms.
Mr. Dease.	Mr. Mundella.
Mr. Wilbraham Egerton.	Mr. Norwood.
Mr. Elliot.	Mr. Pease.
Mr. French.	Mr. Arthur Peel.
Sir George Jenkinson.	
Mr. King-Harman.	
Colonel Kingscote.	
Sir Rainald Knightley.	
Mr. Murphy.	
Mr. Ritchie.	
Mr. Torr.	

Another Amendment proposed to the proposed Amendment to leave out the word "cattle," in order to insert the words "all animals"—(The *Chairman*).—Question put, That the word "cattle" stand part of the proposed Amendment.—The Committee divided:

Ayes, 7.	Noes, 16.
Mr. Anderson.	Major Allen.
Mr. Chamberlain.	Mr. Assheton.
Mr. William Edward Forster.	Mr. Cameron of Lochiel.
Mr. John Holms.	Mr. Chaplin.
Mr. Mundella.	Mr. Dease.
Mr. Norwood.	Mr. Wilbraham Egerton.
Mr. Arthur Peel.	Mr. Elliot.
	Mr. French.
	Sir George Jenkinson.
	Mr. King-Harman.
	Colonel Kingscote.
	Sir Rainald Knightley.
	Mr. Murphy.
	Mr. Pease.
	Mr. Ritchie.
	Mr. Torr.

Question, That the words "all animals" be there inserted,—put, and *agreed to*.—Another Amendment made to the proposed Amendment.—Another Amendment proposed to the

the proposed Amendment, after the words "Schleswig-Holstein,"—to insert the words "Austro-Hungary"—(Mr. *King-Harman*).—Question proposed, That those words be there inserted.—Amendment, and Question by leave, *withdrawn*.

Another Amendment proposed to proposed Amendment, after the word "Belgium," to insert the following words: "and any country which does not provide proper safeguards against the introduction of cattle plague"—(Mr. *Wilbraham Egerton*).—Question, That those words be there inserted,—put, and *negatived*.—Another Amendment proposed to proposed Amendment, after the word "Belgium," to insert the following words, "and any other countries where cattle plague is known to exist"—(Sir *George Jenkinson*).—Question, That those words be there inserted,—put, and *negatived*.—Other Amendments made.

Another Amendment proposed to proposed Amendment, after the words "scheduled countries," to insert the words, "with power to the Privy Council to forbid the importation of animals from other countries, if they think fit"—(Mr. *French*).—Question put, That those words be there inserted.—The Committee divided:

Ayes, 14.	Noes, 8.
Major Allen.	Mr. Anderson.
Mr. Cameron of Lochiel.	Mr. Assheton.
Mr. Chaplin.	Mr. Chamberlain.
Mr. Dease.	Mr. John Holms.
Mr. Wilbraham Egerton.	Mr. Mundella.
Mr. Elliot.	Mr. Norwood.
Mr. French.	Mr. Arthur Peel.
Sir George Jenkinson.	Mr. Ritchie.
Mr. King-Harman.	
Colonel Kingscote.	
Sir Rainald Kinghtley.	
Mr. Murphy.	
Mr. Pease.	
Mr. Torr.	

Another Amendment proposed to the proposed Amendment, after the words "two months," to add the following words: "Provided that the Privy Council shall have the power from time to time to move countries out of the list of scheduled countries when they are of opinion that such countries are free from cattle plague, pleuro-pneumonia, and foot-and-mouth disease"—(Mr. *Pease*).—Question put, That those words be there added.—The Committee divided:

Ayes, 10.	Noes, 13.
Mr. Anderson.	Major Allen.
Mr. Chamberlain.	Mr. Assheton.
Mr. William Edward Forster.	Mr. Cameron of Lochiel.
Mr. John Holms.	Mr. Chaplin.
Mr. Mundella.	Mr. Dease.
Mr. Norwood.	Mr. Wilbraham Egerton.
Mr. Pease.	Mr. Elliot.
Mr. Arthur Peel.	Mr. French.
Mr. Ritchie.	Sir George Jenkinson.
Mr. Torr.	Mr. King-Harman.
	Colonel Kingscote.
	Sir Rainald Knightley.
	Mr. Murphy.

Another Amendment proposed to the proposed Amendment, after the words "two months," to add the words: "Provided that the Privy Council shall have power to admit into the list of schedule countries Germany (except Holstein) and Belgium, when they are of opinion that it is safe to do so"—(Mr. *Pease*).—Question put, That those words be there added.—The Committee divided:

Ayes, 9.	Noes, 15.
Mr. Anderson.	Major Allen.
Mr. Chamberlain.	Mr. Assheton.
Mr. William Edward Forster.	Mr. Cameron of Lochiel.
Mr. John Holms.	Mr. Chaplin.
Mr. Mundella.	Mr. Dease.
Mr. Norwood.	Mr. Wilbraham Egerton.
Mr. Pease.	Mr. Elliot.
Mr. Arthur Peel.	Mr. French.
Mr. Ritchie.	Sir George Jenkinson.
	Mr. King-Harman.
	Colonel Kingscote.
	Sir Rainald Knightley.
	Mr. M'Lagan.
	Mr. Murphy.
	Mr. Torr.

Question, That the Amendment, as amended, be added to the paragraph,—put, and *agreed to.*

Question put, That the paragraph, as amended, stand part of the proposed Report.—The Committee divided:

Ayes, 15.	Noes, 9.
Major Allen.	Mr. Anderson.
Mr. Assheton.	Mr. Chamberlain.
Mr. Cameron of Lochiel.	Mr. William Edward Forster.
Mr. Chaplin.	Mr. John Holms.
Mr. Dease.	Mr. Mundella.
Mr. Wilbraham Egerton.	Mr. Norwood.
Mr. Elliot.	Mr. Pease.
Mr. French.	Mr. Arthur Peel.
Sir George Jenkinson.	Mr. Ritchie.
Mr. King-Harman.	
Colonel Kingscote.	
Sir Rainald Knightley.	
Mr. M'Lagan.	
Mr. Murphy.	
Mr. Torr.	

Paragraph 28.—Amended, and *agreed to.*

Paragraph 29.—Amendments made.—Another Amendment proposed, in line 7, to leave out the words "to famine rates"—(Mr. *Chaplin*).—Question, That the words "to famine rates" stand part of the paragraph,—put, and *negatived.*—An Amendment made.—Paragraph, as amended, *agreed to.*

Paragraphs 30—32, amended, and *agreed to.*

Paragraph 33, amended.—Question, That the paragraph, as amended, stand part of the proposed Report.—The Committee divided:

Ayes, 14.	Noes, 7.
Major Allen.	Mr. Anderson.
Mr. Assheton.	Mr. Chamberlain.
Mr. Chaplin.	Mr. William Edward Forster.
Mr. Wilbraham Egerton.	Mr. John Holms.
Mr. Elliot.	Mr. Mundella.
Mr. French.	Mr. Pease.
Mr. King-Harman.	Mr. Arthur Peel.
Colonel Kingscote.	
Sir Rainald Knightley.	
Mr. M'Lagan.	
Mr. Murphy.	
Mr. Norwood.	
Mr. Ritchie.	
Mr. Torr.	

Paragraphs 34—36, amended, and *agreed to.*

Paragraph 37.—Amendments made.—Another Amendment proposed, at the end of the paragraph, to add the words: "And your Committee think it to be their duty, in view of the evidence which they have received, to recommend that a searching inquiry should be made into the subject of the transit of cattle from Ireland to the ports of Great Britain; into the provisions made for their reception at the ports of departure and of arrival, and into their treatment during the voyage"—(Mr. *Arthur Peel*).—Question, That those words be there added,—put, and *agreed to.*—Paragraph, as amended, *agreed to.*

Paragraph 38.—Amendments made.—Another Amendment proposed, in Sub-section 8. After the words "slaughter of" to insert the word "diseased"—(Mr. *Wilbraham Egerton*).—Question put, That the word "diseased" be there inserted.—The Committee divided:

Ayes, 11.	Noes, 12.
Mr. Anderson.	Major Allen.
Mr. Assheton.	Mr. Chamberlain.
Mr. Cameron of Lochiel.	Mr. Chaplin.
Mr. Dease.	Mr. William Edward Forster.
Mr. Wilbraham Egerton.	Mr. French.
Mr. Elliot.	Mr. John Holms.
Colonel Kingscote.	Sir George Jenkinson.
Mr. M'Lagan.	Mr. King-Harman.
Mr. Pease.	Sir Rainald Knightley.
Mr. Arthur Peel.	Mr. Mundella.
Mr. Torr.	Mr. Murphy.
	Mr. Norwood.

Another

Another Amendment proposed, in Sub-section 8, to leave out the word "local," in order to insert the word "Imperial"—(Mr. *Chaplin.*—Question put, That the word "local" stand part of the paragraph.—The Committee divided:

Ayes, 15.	Noes, 8.
Mr. Anderson.	Major Allen.
Mr. Cameron of Lochiel.	Mr. Assheton.
Mr. Chamberlain.	Mr. Chaplin.
Mr. Dease.	Mr. Wilbraham Egerton.
Mr. William Edward Forster.	Mr. Elliot.
Mr. French.	Sir George Jenkinson.
Mr. John Holmes.	Colonel Kingscote.
Mr. King-Harman.	Sir Rainald Knightley.
Mr. M'Lagan.	
Mr. Mundella.	
Mr. Murphy.	
Mr. Norwood.	
Mr. Pease.	
Mr. Arthur Peel.	
Mr. Torr.	

Other Amendments made.—Another Amendment proposed, after Sub-section 11, to insert the following Sub-section:—"And your Committee are of opinion that no further restrictions should be placed on the importation of foreign animals in respect to foot-and-mouth disease and pleuro-pneumonia, unless at the same time orders be enforced throughout Great Britain, that in every district where either pleuro-pneumonia or foot-and-mouth disease exists, all movement of cattle be prohibited, except under license; that fairs and markets be under similar restrictions, and that absolute prohibition of movement be enforced against infected farms for periods varying from two months in pleuro-pneumonia, to 28 days in outbreaks of foot-and-mouth disease"—(Mr. *William Edward Forster*).

Question proposed, That those words be there inserted.—Amendment proposed to proposed Amendment, after the word "exists" to insert the following words: "and which has been declared by the Privy Council to be infected"—(*The Chairman*).—Question put, That those words be there inserted.—The Committee divided:

Ayes, 14.	Noes, 9.
Major Allen.	Mr. Anderson.
Mr. Assheton.	Mr. Chamberlain.
Mr. Cameron of Lochiel.	Mr. Chaplin.
Mr. Dease.	Mr. William Edward Forster.
Mr. Wilbraham Egerton.	Mr. John Holms.
Mr. Elliot.	Sir George Jenkinson.
Mr. French.	Mr. Mundella.
Mr. King-Harman.	Mr. Norwood.
Colonel Kingscote.	Mr. Arthur Peel.
Sir Rainald Knightley.	
Mr. M'Lagan.	
Mr. Murphy.	
Mr. Pease.	
Mr. Torr.	

Question put, That the proposed Sub-section, as amended, be there inserted.—The Committee divided:

Ayes, 16.	Noes, 7.
Mr. Anderson.	Major Allen.
Mr. Assheton.	Mr. Chaplin
Mr. Cameron of Lochiel.	Mr. Wilbraham Egerton.
Mr. Chamberlain.	Mr. Elliot.
Mr. Dease.	Mr. French.
Mr. William Edward Forster.	Sir George Jenkinson.
Mr. John Holmes.	Sir Rainald Knightley.
Mr. King-Harman.	
Colonel Kingscote.	
Mr. M'Lagan.	
Mr. Mundella.	
Mr. Murphy.	
Mr. Norwood.	
Mr. Pease.	
Mr. Arthur Peel.	
Mr. Torr.	

Another Amendment made.—Paragraph, as amended, *agreed to.*

Postponed paragraph 26, amended, and *agreed to.*

Question put, That this Report, as amended, be the Report of the Committee to the House.—The Committee divided:

Ayes, 16.	Noes, 7.
Major Allen.	Mr. Anderson.
Mr. Assheton.	Mr. Chamberlain.
Mr. Cameron of Lochiel.	Mr. William Edward Forster.
Mr. Chaplin.	Mr. John Holms.
Mr. Dease.	Mr. Mundella.
Mr. Wilbraham Egerton.	Mr. Norwood.
Mr. Elliot.	Mr. Arthur Peel.

Mr. Arthur Peel.
Sir Henry Selwin Ibbetson.
Mr. Torr.

SIR HENRY SELWIN IBBETSON, IN THE CHAIR.

Professor GEORGE THOMAS BROWN, called in; and Examined.

Chairman.

1. YOU are attached, I believe, to the Privy Council Department, having charge of the diseases of animals in the country?—I am the professional officer of the Veterinary Department.

2. As such, you are able to tell the Committee what measures have been adopted in that department since the last outbreak of cattle plague in the country, in 1865, 1866, and 1867?—The measures chiefly relate to the passing of the two Acts of Parliament, and several Orders of Council. The cattle plague appeared in this country in June 1865, and it was not finally extinguished until the last week in August 1867. During the progress of the plague, various Orders were issued giving certain powers to local authorities, and also to inspectors appointed by them, and by the Privy Council. The chief legislative measure, during the prevalence of the disease, was the passing of the Cattle Diseases Prevention Act, of the 20th February 1866, 28 & 29 Vict. c. 2. Under that Act foreign animals were only to be landed at certain ports, and they were not to be moved from the town or place alive; but exceptions were afterwards made in favour of the metropolis, and cattle were allowed to be moved along a defined route from Thames Haven, which is in the Port of London; also from Harwich, and from Southampton,

Chairman—continued.

to the metropolis. At that time, as the Committee I have no doubt are aware, there was a cordon drawn round the metropolis, and animals could not be moved across the boundaries alive. In June 1867, an Order was passed providing for the detention of foreign cattle for 12 hours at the landing-place, or in some lair adjacent to it, for the purpose of inspection. In October 1867, another Order was passed restricting the number of ports where foreign animals could be landed. Then followed various Orders of Council, directed against the importation of either cattle plague or sheep pox. In July 1868, owing to the prevalence of sheep pox, sheep were scheduled from Holstein, and also from Hamburg. Then, in August 1869, the Contagious Diseases (Animals) Act, which is now in force, was passed. In that Act pleuro-pneumonia and foot-and-mouth disease were, for the first time I believe, in this country, included in the definition of contagious diseases.

3. And that Act gave power also with regard to defining the limits of ports, did it not?—Yes, it gave power to define the limits of ports, and it also enumerated certain countries from which animals could only be imported for the purpose of slaughter. Those countries were named "scheduled countries."

4. Was

Professor *Brown.*

11 May 1877.

Chairman—continued.

4. Was France at that time first added to the schedule?—France was not added to the schedule until September 1870.

5. Sheep and goats from France and Belgium were scheduled, were they not, in 1870?—In 1870, owing to the prevalence of cattle plague on the Continent, sheep and goats from Germany, France, and Belgium, were scheduled. Cattle, meat, and hides, were prohibited from France and Belgium in March 1871.

6. About that time there had been a foreign market created at Deptford, had there not, for the slaughter of foreign cattle?—Yes, and the market was opened in December 1871. The cordon was removed from the metropolis in January 1872.

7. So that on that market being opened, the freedom of ingress of cattle into the metropolis was again established, and the cattle from the scheduled countries were taken to the Deptford market?—That was so.

8. The next step, I think, was taking Schleswig-Holstein out of the schedule in 1872?—Schleswig and Holstein were taken out of the schedule, in July 1872, on an agreement or understanding which was entered into with the authorities of that district, amounting to the arrangement that no cattle should be imported into either Schleswig or Holstein from countries where cattle plague was likely to exist. The effect of the arrangement was, that cattle were not to be imported from Germany into those districts.

9. Cattle plague had been introduced from Germany into England by Russian cattle, had it not?—In 1865 it had, and that was the reason that the agreement was made.

10. Was one of the principal reasons for that, that the notice of disease that you received from Germany hardly ever arrived before the diseased animals themselves came?—I believe in each instance, that is to say, in 1869, in 1872, and in 1877, cattle affected with the disease, or cattle which had come from the districts in which the disease existed, were landed in this country before any intimation of the existence of the disease was received from the German Government. In 1869, we escaped an outbreak, but we got cattle from East Prussia after the cattle plague had broken out there.

Mr. *W. E. Forster.*

11. In 1872, although the cattle affected with the cattle plague were landed before we received any official intimation from the German Government, we had obtained, had we not, private information which gave us reasons to suspect it?—We had reasons to suspect it, and it was on that account, I apprehend, that only one animal in a cargo which had the disease was detected, the inspector having been warned to take extra care in his examination.

12. Which warning we had obtained by our own means of information, and it had not been conveyed to us by the German Government?—Precisely.

Chairman.

13. That does not affect the question which I asked, which was whether on more than one occasion the disease has not shown itself in this country before the official notification has been

Chairman—continued.

received of the disease having been discovered in the country from which the cattle were imported?—On two occasions, in 1872 and also in 1877, we had diseased animals brought into the country before we were aware of the existence of the disease abroad from official sources.

14. Can you describe how the disease that was imported then spread?—In 1872, although the animals affected with cattle plague were landed at Deptford, at Newcastle, at Hartlepool, and at Leith, we did not have the disease introduced into the interior of the country from those cargoes. No extension of the disease took place from those landing-places. In Hull a cargo of animals arrived in July 1872 from Russia, after importation of animals from that country had been prohibited by an Order of Council. The animals consequently were not landed, but were slaughtered on board the vessel, and sent out to sea. Notwithstanding the fact of the animals having been kept from the landing-place, cattle which were sold in the Hull market, on the following Monday, two days after the carcases were sent out to sea, took the disease into two districts in the East Riding of Yorkshire. It is therefore only possible to conclude that the infection here was conveyed by what is termed the mediate method. By the term "mediate contagion," which is constantly used in medical language, is meant the conveyance of infective matter by the agency of persons or things which have been in contact with diseased animals.

15. Notwithstanding the precautions which were then taken, the disease was communicated probably through the people who carried out the slaughter?—And possibly by drovers and persons who were on board the boat at the time that the animals came into the dock.

16. What measures were adopted at that time in consequence of that spread of the disease in Yorkshire?—As soon as the disease was discovered in the Pocklington district, an Order was passed prohibiting fairs and markets in the East Riding, and only permitting the removal of animals by license. On that occasion I may mention that when I arrived in the district where the disease existed, I found that all the animals had been slaughtered and buried.

Mr. *W. E. Forster.*

17. Do you mean merely the infected animals, or all the animals in the herd that was infected?—All in the one herd in the particular field, but there were three small herds in adjoining fields, and I represented to the local authorities at the time that if those herds could be slaughtered there was every reason to believe that the disease would be stamped out. There was no power vested in them by the provisions of the Act to order such slaughter, because the animals had not been in contact, and had not been in the same premises or in the same herd; and the owners refused to have them slaughtered, and consequently they were left alive. Two of those herds escaped; the other was attacked, and that circumstance kept the disease alive for three months in that district. At the time of my arrival, if the slaughter of those three herds, which amounted to about 30 animals, could have been carried out, there would have been no more cattle plague in the East Riding of Yorkshire, so far as I can judge.

18. Therefore

Chairman.

18. Therefore the result of that experience shows that it was not only necessary to take some measures with regard to animals absolutely connected or brought together in the same herd, but that any animals in a cordon surrounding that herd ought to be treated as infected?—The authorities having to deal with cattle plague should have power, as they have in Germany, to slaughter in any case in which they may be advised that it is necessary. There is no question of contact in Germany, it is simply a question of how far the slaughter should be extended, and what animals had been exposed to the infection.

19. The question is what circle will protect you, the disease having been disseminated?—Quite so.

20. As the result of that, were any measures taken for prohibiting importation from Russia of either cattle or manure?—Previously to the outbreak in the East Riding of Yorkshire, the importation of cattle and meat had been prohibited from Russia in consequence of the information which we had of the existence of the disease there; and sheep and goats were also scheduled, and they could only be landed for slaughter, and could not be landed at all if they were brought in the same vessel with cattle; and that Order still remains in force.

21. I understood you to say that the importation of cattle, manure, hoofs, and meat was prohibited from Russia?—The importation of cattle was strictly prohibited; meat can only be landed at certain ports where cattle are landed, and cannot be removed from the landing-place without a certificate of an inspector to the effect that it is not likely to introduce contagious disease.

22. Even when the meat comes over as a separate cargo?—Under any circumstances.

23. That Order remains in force at the present moment, I believe?—It does.

24. You said that sheep and goats were also put into the schedule; does that Order remain in force with regard to them?—It does.

25. And with regard to the German sheep and goats?—German sheep and goats have only lately been placed in the schedule in consequence of the recent outbreak of cattle plague. Previously to 1877, sheep and goats from Germany could be landed at undefined parts of ports, and after 12 hours' detention could be moved to any part of the country.

26. That was in consequence of the Order prohibiting their being removed in 1873, was it not?—German sheep were only scheduled during the time that cattle plague existed in Germany. German cattle have been scheduled from the time of the passing of the Act; but it was always believed that the danger of introducing cattle plague by means of sheep was so slight that it was not necessary to insist upon their slaughter at the landing-places. I may say that we have no instance of the introduction of the disease into this country in this century from abroad by means of sheep or goats.

27. Were the sheep removed from the schedule with regard to Schleswig-Holstein at the same time?—After the cessation of cattle plague in Germany, in January 1873, Schleswig and Holstein were removed from the schedule.

Mr. *W. E. Forster.*

28. The Schleswig-Holstein cattle were taken out of the schedule before the cattle plague was imported in 1872, were they not?—Shortly before.

29. Immediately after that import they were put back in the schedule?—Yes, in consequence of the outbreak of the cattle plague.

30. Were they again exempt from the schedule afterwards?—Schleswig and Holstein were again removed from the schedule in June 1873.

31. Are they still under the schedule?—The arrangement was modified when the Animals' Order of 1875 was passed. In that Order provision is made to exempt cattle from Schleswig and Holstein from the schedule, from the 23rd of June to the first week in December, so that at the end of June they will be absolutely out of the schedule; at present they are in the schedule. The order does not exempt them until the 24th day of June.

Chairman.

32. And that was by the Order of 1875?—The Animals' Order of 1875.

33. Were any regulations established at that time for the purpose of procuring information as to outbreaks of cattle plague on the continent?—Shortly after that time (I have not the exact date) an arrangement was made, resulting from discussions at several meetings of veterinary surgeons in Vienna, Zurich, and Hamburg, the whole result being that agreements were made with certain countries to insure early information by telegraph of the outbreak of cattle plague.

34. Has that been effective with regard to our recent experience?—It has not in any case. It has happened, I believe, in each instance when cattle plague has crossed the Polish frontier and got into the extreme eastern boundaries of Germany, that by the time the disease was discovered several animals had died. On the last occasion, in 1877, I think six animals had died. That, of course, means that the disease had existed for some time before it was discovered; and with the present facilities of transit, before the Government discovered the existence of the disease in Silesia, animals from the infected districts had gone right across the country.

35. We were deriving our supply so far south that the animals were carried through Germany and they arrived here, and the disease broke out before you were officially informed of any disease existing in the place from which they came?—That was so.

36. Precautions were taken also at landing-places, were they not, of the defined or undefined parts of ports?—The arrangements referring to animals from scheduled countries, which were then in force, and are now in force, are that they shall be detained for 12 hours and inspected, and at the expiration of the 12 hours they are slaughtered, and the slaughtermust be completed with 10 days. At those ports where animals from scheduled countries are landed arrangements are made for the purpose, as far as possible, of separating the defined part from the other parts of the port; but, as I have previously stated, the arrangements in all the ports are not nearly so satisfactory as they should be.

37. That was eminently the case with regard to certain ports as to which evidence was given

Professor *Brown.*

11 May 1877.

Chairman—continued.

before the previous Committee, I think?—It was. I may add that recently we have struck out several ports where the arrangements were incomplete, and where from peculiar circumstances they could not be improved to any extent, and we have induced the authorities at other ports to make arrangements which we considered satisfactory.

38. Has that been the case with regard to the port of Hull, as to which a good deal of evidence was given before?—The authorities at Hull propose to adopt certain arrangements which will considerably improve that port; but it is impossible to say, even with the arrangements which are now proposed, that the system will be quite satisfactory.

39. Those arrangements have not, as I understand from that answer, been carried out at the present moment?—They have not yet been carried out.

40. They were pointed out as defects in the system as far back as the last inquiry that took place, were they not?—They were.

41. I suppose you would represent to the Committee that the defects of your present system are very great with regard to your want of control over the landing of cattle?—Undoubtedly they are; and in reference to cattle plague in particular, the great difficulty is that we have no means of preventing the extension of the disease by mediate contagion. There are no means, for example, of stopping the movement of vessels, or of the persons that are on board those vessels.

42. You have no means of controlling the vessel after she has landed her cargo?—None whatever. The vessel has other cargo and passengers on board destined for some other landing place, and when animals are landed, for example at Deptford, as in the case of the cargo from the "Castor," we have positively to hunt out the vessel before we can take possession of it to insist upon the necessary disinfection.

43. Thus increasing the liability to the spread of the infection from people on board, or going on board, that vessel coming in contact with manure and other things that may be infected?—Quite so. This objection applies chiefly to cattle plague. That disease of all diseases to which animals are subject is the most readily conveyed by mediate contagion. It has been stated that we incur considerable risk of the conveyance of foot and mouth disease in the same way, but the evidence does not justify that conclusion at all.

44. You mean that the evidence does not show that foot and mouth disease is contagious in that way?—It does not show that it is conveyed by mediate contagion in the same way that cattle plague is.

45. Or pleuro-pneumonia?—Pleuro-pneumonia is least of all conveyed in that way.

46. I understood you to say that foot and mouth disease was not so readily conveyed?—It is not. I should like to illustrate it in this way: There are at the Brown Institute at this moment some eight or 10 animals which are placed there for the purpose of experiment. Mr. Duguid, who has charge of them, tried to induce foot and mouth disease by obtaining matter, which is always plentifully supplied at Deptford. He went backwards and forwards constantly, and took parts of animals, saliva, or anything he

Chairman—continued.

pleased, and tried to produce disease by the agency of this infective matter on those animals which he had under his charge; but he entirely failed to do it; and in no one instance did the experiment succeed. If he had tried the same thing with cattle plague it would not have been necessary for him to use any matter at all; he would simply have had to go among the diseased animals and then walk straight into his own place and go among the healthy ones; certainly in two or three visits of that kind he would have produced the disease. So that while I admit that foot and mouth disease may be conveyed by mediate contagion, I contend that the risk as compared with cattle plague is exceedingly slight.

47. What you represent is that it is only a difference in the risk; in the one case a very great, and in the other case only a slight risk is incurred?—Precisely.

48. Do I correctly understand you to say that with regard to pleuro-pneumonia that risk does not exist?—So far as the evidence which we are in possessien of goes, pleuro-pneumonia is never conveyed in that way; we have no proof, that is to say, that persons who have been attending on animals affected with pleuro-pneumonia are capable of conveying the disease to healthy herds. The history of the disease goes to show that it is not communicated in that way.

49. With regard to the present precautions, how do they protect the country from these diseases, looking at it in reference to the period of time which the diseases take to develop themselves?—My impression is that the present system protects us from foot and mouth disease as a rule. Owing to the short period of incubation, which commonly does not extend beyond 36 hours, the risk of the disease escaping the inspector's examination is very slight; and this is proved by the circumstance that it is not uncommon for one or two animals in a thousand to be detected. This at the same time shows to my mind that the inspection is conscientiously performed; and, further, it proves the proposition with which I started, viz., that the disease is almost certain to be developed, more or less during the time that the animals are coming from the country from which they are sent, plus the 12 hours' detention; but I am in possession of evidence which convinces me that occasionally infected animals do escape detection, and that to a certain extent we do add to the number of centres of infection of foot and mouth disease by means of infected animals from abroad. This remark applies chiefly to pigs; swine do not show the disease so markedly as other animals, and they are more likely to escape the inspector's notice than either sheep or cattle; they are more difficult to examine.

50. Does the same period of incubation of the disease exist with them as with other animals?—As nearly as possible; the period of incubation may be taken as from 36 hours to four or five days.

51. That is about the time, is it not, within which cattle plague in general develops itself?—The incubation period of cattle plague will vary from four days to seven days.

52. With regard to pleuro-pneumonia, I believe that takes a very much longer time to develop itself?—To take the extremes, we may say,

Chairman—continued.

say, that it takes from three weeks to as many months.

53. So that it is almost impossible, by the system of quarantine or inspection, to protect yourself against the disease, or at least to detect the disease?—It is absolutely impossible, so far as any system of quarantine is concerned.

54. Are there any improvements of the system that you would suggest by which the protection may be strengthened?—I think it would probably be advisable to refrain from entering into any details at this stage of the examination, as the whole question of the prevention of the extension of the disease in this country is so connected with foreign importation, that the two, I think, should be taken together.

55. Will you tell the Committee what the particulars are with regard to the recent outbreak of cattle plague?—We had the first intelligence of cattle plague in Germany by a telegram dated 9th January, which intimated that an outbreak had occurred in Silesia, and that several animals had died.

56. Did that telegram state that several animals had died of cattle plague?—Yes.

57. From whom did you receive the telegram?—I am not quite certain whether it came from our consul or from the German government, but it was the ordinary official form.

58. It was an official intimation of the outbreak of cattle plague?—It was an official intimation of the outbreak.

Mr. *W. E. Forster.*

59. Do you remember whether it came from our consul at the port, he having been informed by the German authorities, or whether the German authorities had sent information to the German embassy here?—The information was sent by the German authorities.

Chairman.

60. Will you tell the Committee how the whole of the facts occurred in their proper order?—It was something like a month or six weeks before we found out at what time the animals which brought the disease here were really shipped. Immediately on receiving the official notice, the usual course was adopted of sending a telegram to all the port inspectors, warning them that cattle plague had broken out in Germany, and requesting them to be very careful in their examinations. This was merely a formal proceeding; at the time we did not apprehend that cattle plague would extend, because it is very common for Germany to have an outbreak of cattle plague on the eastern frontier and to stamp it out at once, and no interference with the trade takes place; they do not even stop a market.

61. Have you, on more than one occasion, had notifications of cattle plague breaking out in Germany without our suffering from it?—We have on several occasions.

Mr. *W. E. Forster.*

62. What part of Silesia did you hear it was in?—It was in the Oppeln district.

63. Near the Polish frontier?—Close to the Polish frontier. The next intimation which we had was on Monday the 15th January, when a notice appeared in the public papers of the appearance of cattle plague at Altona.

Mr. *W. H. Forster*—continued.

Chairman.

64. Had you no information from the consul of that outbreak?—Not at that time. This notice I read at ten o'clock in the morning, and at the same moment the "Castor" landed her cattle at Deptford. That was the ship that brought 39 animals, all of them affected with the disease, some of them dying of it; one of them died on the shoot as it was been driven from the ship.

Mr. *W. E. Forster.*

65. Where did the ship come from?—From Hamburg.

Chairman.

66. And you had no knowledge of this outbreak previously to seeing it in the public journals?—We had no official notice of the outbreak in Hamburg until, I believe, 12 o'clock of the same day, that is two hours after the animals were landed at Deptford.

67. Did you know in any way that this vessel was bringing a cargo over from that port?—We did not.

68. You had no intelligence at all of the shipment?—None whatever. The consignor had intelligence that the ship was arriving in the ordinary course, but that was merely in the common way of the trade, and, of course, we should have had no notice of the kind.

69. Did you, after your knowledge of it through the public press, receive any official notification of it?—Not of the shipment of these animals in the "Castor." All the information which has been obtained relative to that shipment has been obtained from private sources.

70. In fact, at the time when you saw the notice in the papers, you were unaware of the existence of the disease at Altona, and you were unaware of the fact of this vessel having started with a cargo?—Quite.

71. How did you become aware of the disease breaking out on board the "Castor"?—Subsequently to the landing of the animals at Deptford, an inquiry was made, and it was ascertained that cattle plague was declared to exist in certain stables in Hamburg on the 13th of January. The animals which were sent to Deptford and to Hull were shipped on the previous day.

72. Were they from the same herd of cattle?—They were shipped from the same stables, where cattle plague was discovered on the following morning.

73. In the one case in the vessel "Castor," and in the other case in the "Hansa"?—Yes.

74. When did you receive from Hamburg the official notification of it?—We had no official notification from Hamburg of the leaving of those vessels. The official information of the existence of cattle plague in Hamburg was received on the day of the landing of the cargo at Deptford.

75. But after the cattle had landed?—Two hours after the cattle had landed.

76. Then your inspector at the port was the first to inform you of the fact of the disease existing on board the "Castor," at Deptford?—He was.

 77. What

Professor *Brown.*

11 May 1877.

Chairman—continued.

77. What action was then taken at Deptford?—Directions were at once given for the slaughter of the whole of the animals; the block in which they were placed was declared an infected place, and was locked up; and precautions were then taken to prevent any persons who were in contact with the diseased animals from leaving the place without being properly disinfected. But up to that time there were over a dozen customs officers, and more than that, that number of drovers and other persons engaged about the animals both on board the vessel and after they were landed; of course all those men had moved freely in any direction, as at the time there was no reason to suspect the existence of disease.

78. The disease had not been reported until after the vessel had been inspected by the Custom House officers?—No.

79. When you did take action, were you able entirely to disinfect and control the people who visited that ship?—As far as it was possible we did so; but it will be quite apparent that there are great difficulties in dealing with such men as drovers and slaughtermen who are about the cattle, who are always literally saturated with blood and dirt of all kinds; and, short of literally stripping them and thoroughly washing them, and burning all their clothes, there is no possibility of anything like perfect disinfection.

80. Did not that vessel leave the place for the purpose of unloading other cargo?—The vessel went to some landing-place in London with passengers, and then went on to Horsleydown for the purpose of unloading the rest of the cargo.

81. So that you had no further control over her?—Not until cattle plague was discovered in Deptford Market, and then inquiries were at once made as to the whereabouts of the vessel, and one of the travelling inspectors was instructed to take the necessary means to ensure its being perfectly disinfected.

82. But in the meantime she had the opportunity of spreading the disease at various points in London?—Undoubtedly. Considering the facility with which persons could go on board, and considering further the fact that all the animals were carried on the deck, it is a somewhat remarkable circumstance that the disease was not more extensively spread in London than it was.

83. It points to the risk that is run in all these cases of importation under the present restrictions?—Undoubtedly.

84. Had the vessel a full cargo of cattle, or did she come over with only a certain number of cattle and a general cargo?—She started with only 40 cattle on the deck; one of those died, and was thrown overboard on the way, and 39 were landed, one of them dying on the landing-place before it could be got into the lairs.

85. So that the disease had completely developed itself during the voyage?—There cannot be the slightest question that the disease was well developed in some of the animals before they were shipped.

86. The "Castor" arrived on the 15th, and you got the official notification two hours after you had seen it in the newspapers?—That is so.

87. What precautions were taken with regard to the outbreak at Hull, which took place from the same shed?—In the case of Hull, there was no suspicion at all of animals having been landed at that port from the infected sheds at Altona, until one of the travelling inspectors, Mr. Courtney, who had charge of the "Castor" during the disinfection, heard a remark from one of the persons on board to this effect: "I wonder what they have done with the other lot that went to Hull?" On being informed of this circumstance, I made inquiries, which occupied something like a week or 10 days, and I ascertained finally that the same man who had sent 40 animals in the "Castor" to Deptford had also sent 18 animals in the "Hansa" to Hull. Those animals on being examined by the inspector were found, some of them at least, to be suffering from foot and mouth disease. It was some time afterwards, in fact not until the outbreak occurred in Hull, that we ascertained, on inquiry in the district, that two of these animals, in addition to being affected with foot and mouth disease, had shown symptoms of some more serious malady, which had induced the inspector to have them slaughtered at once. He states that there was in his mind at the time no suspicion of cattle plague, and he failed to recognise the disease in his post-mortem examination of those two animals; but from the description which he has given of the symptoms and appearance of the animals, added to the evidence which we have obtained as to the origin of the animals, of which he was at the time quite ignorant, there can be little or no doubt that these two animals were the subjects of cattle plague.

88. Following your usual course, did you issue a circular to the authorities at that time?—On the 17th January, a circular was prepared and sent at once warning the local authorities all over the country of the possibility of cattle plague having escaped from the metropolis.

89. That was before you had taken any step to investigate the matter?—Instantly, on the discovery of the disease.

90. What further steps did you take with regard to the importation of animals from foreign countries?—The importation of cattle, meat, and hides from Germany and Belgium was prohibited on January the 27th, in consequence of the information which was received of the continued spread of the disease in that country.

91. Subsequently to your first intelligence you had information that the disease had not been stamped out, but that it was spreading through Germany?—Subsequently to the first announcement of the disease at Altona, I ascertained from private sources, that on the day of the discovery of the outbreak in Silesia, animals from that district were standing in the Berlin market, and on the following Wednesday some of them were standing in the market at Hamburg. That was long before the German government was aware of infected animals having left that district.

92. That was before we got any intelligence here of the breaking out of the disease?—It was.

93. On the 27th January you prohibited the importation of cattle, meat, and hides, from those countries?—From Germany and Belgium.

94. Why did you include Belgium as well as Germany?—On account of Belgium being chiefly a country of transit. We knew, of course, that if we stopped live cattle coming from Germany, it would be the simplest thing in the world to send them through Belgium. We prohibited meat

Chairman—continued.

meat from Hamburg chiefly on account of the information which we had that they were slaughtering a great many animals there, and we thought it extremely probable that, before the disease was discovered in other places, they would kill all the diseased animals and send them over to us; and coming in the form of carcases, we should not, of course, know whether they were diseased or healthy so long as the meat was in good condition.

95. Besides Germany and Belgium, was France included in that circular?—France was already scheduled, and we did not think it necessary to prohibit the importation of cattle from France.

96. But up to that time, sheep and goats had been coming in from those countries; were they scheduled then?—They were scheduled, that is to say, they could only be landed in ports where provision was made for slaughtering them.

97. And that was in the same Order of the 27th January?—I believe it was not included in that Order, as sheep and goats were already scheduled.

98. The disease was reported again, I think, on the 30th January?—On the 30th January one of our inspectors informed me that he had seen some animals in a dairy in Limehouse which he believed to be suffering from cattle plague.

99. Was that belief confirmed afterwards, or what took place?—On receiving this information, the chief inspector was requested to make an inquiry. It was in the evening when he made his visit. I arranged to meet him early on the following morning, in order to get his report, and he informed me that he was satisfied that the disease was cattle plague. I immediately went to the shed and inspected the animals, and found that nearly all of them were suffering.

100. Were there peculiar symptoms about them?—The symptoms were in many respects peculiar. There was, for instance, an entire absence of those indications in the mouth which are always looked upon as most characteristic, and there was a peculiarity also in the temperature; instead of finding an elevated temperature in the majority of the animals, some of them were below the normal temperature, and others were very little above it; but from the aspect of the animals altogether, and from the fact that no other disease could possibly produce so much damage in the same space of time, there was no doubt left on my mind that the disease was true rinderpest.

101. You satisfied yourself that it was a fresh outbreak of cattle plague?—I had no doubt about it, and particularly I arrived at the conclusion from the fact which I remembered, viz., that an affection of the same type and form of cattle plague, identical with this, had appeared in the east of London in 1867, and at that time it was the subject of remark, that some of the characteristic symptoms were entirely absent.

102. The same symptoms, or rather the same want of symptoms, had been shown in the last outbreak of cattle plague?—They had.

103. As a result, did the department do anything at once upon that discovery?—Immediately on the discovery of the disease, an Order was passed prohibiting the movement of cattle, sheep, and goats out of the metropolis.

104. A cordon was drawn round the metropolis?—A cordon was drawn round the metropolis.

105. Similarly to the course which was adopted in the first outbreak?—Similarly to the course which was adopted in the first outbreak.

106. Have you formed any opinion as to how this disease could have been conveyed to the Limehouse shed?—We ascertained that several of the drovers, and also the customs officers, who were on board the vessel, lived in that district; and we have ascertained quite recently that a drover removed a cow from the shed in Limehouse where the disease occurred, to which I have just referred, on the same day of the landing of the "Castor's" cargo at Deptford. The individual refuses to admit that he was at Deptford on that day; but he goes so far as to say that he was in company with a man who had just come from there. He moved a cow from this shed on that day, and it is further stated that he went into the shed and untied the cow himself.

107. That points rather to connecting it with the diseased cattle at Deptford?—There can be no question, I think, that the disease was conveyed from Deptford in some such way.

108. Very soon after that, I think, the department prohibited all markets in the metropolis, except by license?—By Order of Council of the 2nd February, markets and sales in the metropolis were prohibited except by license, and at the same time licenses were issued for the holding of the Metropolitan Market and for the holding of the Deptford Market.

109. In consequence of this, I think, you also sent out another circular from the department to the country?—We sent out a circular warning them that it was believed that some animals had escaped from the metropolis. There was reason at that time to apprehend that the thing had really taken place.

110. You mean that animals that had been in contact with those diseased beasts had been removed from the metropolis?—It was ascertained that some of the dairies in the east of London had been entirely emptied, and it was admitted that the cows had been sent to the Metropolitan Market. Therefore, it was a fair presumption that the animals had been removed from the sheds in consequence of an outbreak of some disease which was suspected to be cattle plague; because a dairyman would not remove all his stock on any other plea; and therefore it was also assumed that some of those animals might by chance have been taken to some other parts of the country from the Metropolitan Market before the discovery of the disease.

111. In consequence of that supposition, this fresh circular was issued to the authorities?—It was.

112. The cattle plague broke out next in Essex, did it not?—It extended to Essex; that is to say, it crossed the metropolitan boundary on the 10th February.

113. Where did that first appear?—It first appeared in Stratford.

114. Was that in a market, or in a dairy shed?—In a dairy shed.

115. Was any Order passed then by the local authorities?—An Order was passed by the Lords of the Privy Council on the 10th February, giving power to the local authorities to prohibit

Professor *Brown.*

11 May 1877.

Chairman—continued.

or regulate the movement of cattle in their districts, and to prohibit the holding of markets except by license.

116. Did the Stratford outbreak spread?—The disease extended to several dairies in the same districts; but, excepting in two cases, which are of a very doubtful character, it did not reach to any distance from the metropolitan boundary.

117. Did the local authority take any action under the Order of the Privy Council enabling them to prohibit the movement of cattle and the holding of markets in a certain number of petty sessional divisions. The line which they drew extended as far as Thames Haven.

188. And no further outbreak has taken place there, I believe, since that?—Not since that.

119. Then the disease showed next at Hull, did it not?—It was discovered for the first time in the dairies at Hull on the 17th February.

120. Is that what you referred to just now as having been discovered subsequently to the cargo from the "Hansa" having been distributed?—It was. I may add that, on an inquiry being made, it was found that several dairymen had got rid of their stock, so that the long interval between the landing of the cargo on the 14th January, and the discovery of the disease on the 17th February, more than a month, would be easily filled up by the occurrence of cases which had been concealed, the animals having been got rid of.

121. Do you mean by that that the animals were slaughtered for food?—We failed to ascertain what was done with the animals. The owners asserted, as they always do, that they were sent to the butchers, and the results go to prove that their statements were correct; because if they had sent them into the Hull Market and then had been taken over the country, there is no doubt that we should have had outbreaks in various parts.

122. You failed to trace, in reality, how that cargo was distributed; but you believe, in consequence of the disease not spreading, that most of them had gone into the market for slaughter?—The particular cargo from the "Hansa" was accounted for. Necessarily, coming from Germany, the animals must be slaughtered in the defined part. The stock of cows which were removed from the dairies in Hull, before the disease was discovered, were not traced; but in consequence of there being no outbreak of disease in the East Riding, I am led to believe that they were really all slaughtered, as the owners stated.

123. You sent an inspector down at once, I believe, on this outbreak taking place at Hull?—The chief inspector was at once instructed to proceed there, and Captain Tennant, one of the travelling inspectors, took charge of the district, practically on behalf of the department, for the purpose of making inquiries for our own information, not of course with the idea of interfering with the action of the local authorities.

124. You advised the local authorities, I suppose, with regard to the action which they ought to take?—We advised them through the chief inspector, and also through Captain Tennant.

125. Did they take action at once upon that?—They immediately directed an inspection of all the dairies in Hull, and an Order was passed by

Chairman—continued.

the Lords of the Council prohibiting the holding of fairs and markets in the East Riding.

126. Was that effectual in preventing the spread, or did the disease continue in Hull?—The disease continued until March the 22nd.

127. How did it show itself during that time?—Solely in the dairies.

128. It broke out in more than one of the dairies, did it not?—In six dairies in Hull.

129. Those circumstances followed each other in succession up to the 22nd March?—Yes. In reference to the origin of the disease here, I may state, for the information of the Committee, that Captain Tennant gained what he considered to be reasonable evidence that the dairy-keepers in Hull are in the habit of buying the surplus fodder, which is brought over in the ships which convey foreign cattle.

130. And, therefore, some of the surplus fodder that came over in the ship with the diseased cattle may have been so bought?—It is possible. I do not quite understand what they mean by "litter," because foreign animals do not really have "litter" under them, but something in the way of hay or straw is said to be habitually bought by the dairymen of Hull and used as "litter" for their cattle.

131. Entailing a certain risk in case it has been on board the vessel?—Unquestionably. In short it is an action of which one would not have accused any sane man.

132. The next step was the appearance of the cattle plague in Lincolnshire, was it not?—Cattle plague appeared in Lincolshire in one farm, near Great Grimsby, some time after the outbreak in Hull.

133. That was on the 8th March, was it not?—It was.

134. Did it extend beyond that farm?—It did not extend beyond the farm where it first appeared.

135. Did the local authorities take the same precautions as they had taken in Yorkshire?—They acted under the Order, to a certain extent, prohibiting fairs and markets in certain portions of the county; but subsequently, owing to a representation from some of the local authorities, an Order was passed by the Privy Council prohibiting fairs and markets in the whole of the East Riding. That Order still remains in force.

136. The disease has not spread, I think, in that county at all since that?—It has not.

137. To go back to the metropolis, we come next to the extension of the disease to Willesden, do we not?—That information was received at the Privy Council Office in the first week in April, on the 7th April, the statement being that the animals were seen to be diseased on the previous day.

138. What was the history of that outbreak?—It was ascertained during our inquiry, which lasted several weeks (because in all these cases the information which is obtained is got by degrees, and only by perpetual cross-questioning), that the owner of the herd had given notice of the existence of the disease on the 2nd of April, which was Easter Monday. During the night one of his cows died; the inspector of the district attended on the following morning, on the Tuesday, and made a post mortem examination, that was on the 3rd; he states, that the result of this examination did not suggest to his mind the existence

Chairman—continued.

existence of cattle plague. The owner, on the other hand, states that he was so convinced that it was cattle plague, that he told the inspector that if he did not give notice to the authorities he should do it himself. No notice, however, appears to have been given until Saturday morning, the 7th. On that day the inspector communicated with the clerk of the peace for Middlesex, and immediately on receiving the information, the representative of the clerk of the peace came to the Veterinary Department with the inspector and gave me the information.

139. So that the outbreak, whatever it was, was in existence from the 3rd up to the 7th, before you were aware of it?—Undoubtedly; and meanwhile, if the owner had so chosen, there was no law to prevent him sending his animals to any part of Scotland or anywhere else.

140. They might have been distributed all over the country during that interval?—All over the country.

141. What was the action taken by the local authorities as soon as knowledge of the facts was made public?—The clerk of the peace gave instructions in my presence on the 7th of April to the effect that if the chief inspector decided that the disease was cattle plague, all the diseased animals should be slaughtered. The inspector did decide that it was cattle plague; in fact, there was no question about the matter; and some 15 animals were slaughtered and buried on the Saturday night, the 7th. On the Sunday morning, I went to Willesden with the chief inspector, and in walking through the sheds, I counted some 25 animals suffering from the disease in its most advanced stage.

142. Was that subsequently to the 15 having been buried?—The 15 had then just been buried. The local authority met on the Monday, and this is one of the difficulties which we have to contend with in reference to local authorities; that no one appears to have the power to order the slaughter of animals that have been in contact with diseased ones. The clerk of the peace had not such power, and he was required to communicate with his local authority. The outbreak was detected on the Saturday, Sunday intervened, and no meeting could take place until the Monday morning. When they did meet, the action which they adopted was most prompt; the slaughter of all the herd was ordered, the place was declared for a mile round an infected place, notice was given to the adjoining occupiers, and all that was suggested by the Veterinary Department was adopted. Among other things I advised that nothing but the meat of healthy animals should be removed, that the hides and offal in each case should be buried; and this recommendation was adopted at once.

143. Were people allowed to go in and out freely during that time?—I believe that directions were issued that persons going into the place should not be allowed to leave unless they were disinfected, but I am aware that those orders were not carried into effect.

144. It is very difficult, I suppose, to enforce an order of that sort?—It is exceedingly difficult for the local authority to enforce an order of that kind with a very limited staff.

145. The Act at present gives all the power to the local authority, does it not?—It gives in-

Chairman—continued.

deed the whole details of the management of an outbreak into their hands. In this particular instance, the defects of that system became painfully apparent. The inspector who had to deal with this outbreak has a practice which extends many miles round the place where he lives, viz.: Hanwell. It is known that he went from the diseased animals on the Saturday night to examine some other animals in the same district which were said to be affected with pleuro-pneumonia; he was accompanied by the valuer, whose business it was to value animals affected either with pleuro-pneumonia or with cattle plague. It is simply impossible to conceive any more likely method of communicating the disease to an indefinite extent than this system which I have just described.

146. In fact, the very agents of the local authority were probably the means of carrying the disease?—Probably, though as far as we can judge in the cases which have come under our notice, they did not convey the disease.

147. But at the same time the liability exists, and in its strongest form?—Undoubtedly; and there is the fact that the disease did spread in the Willesden district to places where it is at least probable that persons who were concerned about the diseased animals on this farm were in the habit of visiting.

148. Even though the disease may not in this instance have been conveyed by the inspector of the local authority, I understood you just now to say that to your knowledge many people had been in and out on the ground where those diseased animals were without any precaution being taken?—That is the case. On the morning of my arrival there, on the Sunday, I saw in the yard, close to the sheds, a butcher, who had heard of the outbreak as soon as we had, and was there prepared to take as many animals as he could get consigned to him; he was present with some assistant, and he had a pony and cart standing in the yard, the man and the horse having their feet covered to the depth of some inches with the manure which was scattered all over the place. They would certainly have gone out without any disinfection if I had not insisted that, before they did leave, they should rub their boots well with lime, which I saw brought for the purpose; and that very imperfect disinfection was all that could be carried out at the time, simply from the absence of any other means.

149. You think that that points to the inability of the local authority, with its present regulations, to deal with such a case?—Quite so.

150. Do you think that their knowledge of the laws which govern disease is sufficiently sound to enable them to deal with it?—I do not. It appears to me that local authorities cannot reasonably be expected to know how to deal with outbreaks of contagious disease. They may be asked to carry out certain detailed directions which are written for them in Acts or Orders, but they cannot possibly deal with emergencies as they arise.

151. And besides, they want the machinery for carrying them out?—They want the machinery as much as they want the necessary knowledge.

152. And I suppose the Department generally get blamed for all the errors committed by the local authority in these cases?—So far as I can judge

Professor *Brown.*

11 May 1877.

Chairman—continued.

judge from what I read and hear, the popular impression is, that all the measures relating to dealing with contagious and infectious diseases are carried out under the immediate direction of the Veterinary Department. So far from this being the case, we are absolutely not in a position to obtain knowledge of the details of measures which are adopted, unless we go beyond our present machinery for the purpose of getting that knowledge; I mean in reference to inquiries which are absolutely indispensable for the information of the Government. The chief inspector, of course, is only available for the investigation of one outbreak at one time. Three of the travelling inspectors, Mr. Courtney, Captain Tennant, and Mr. Ricketts, in compliance with my request, very kindly volunteered to give their assistance; and I should like to say that unless they had worked as they have done, frequently stopping up all night for the purpose of seeing that the measures which were suggested were carried out, I do not imagine that we should have been able to deal with the cattle plague even as well as we have.

153. Have you yourself taken any steps to represent to the Department alterations that would be necessary in consequence of this recent outbreak?—I pointed out to the Lord President the difficulties which the local authorities were labouring under, and the very great risk that the disease would be spread to a serious extent unless some change took place; and by his Grace's direction I wrote a memorandum which was sent to all the local authorities.

154. What were the suggestions which you made in that memorandum as improvements on the existing state of things?—I suggested that the local authority had power to prohibit the entry of persons into premises where cattle plague exists, and I advised that they should act under that power; I also suggested that it was their duty to cause the cleansing and disinfection of any premises where cattle plague existed, or had existed, and to destroy or effectually dispose of manure, litter, and other articles that had been in contact with or used about any diseased animal. Further, it was suggested that they had power to direct the disinfection of the clothes of persons who had been engaged about diseased animals: and I also suggested that the provisions would include slaughtermen, milkers, and the apparatus used by them, and even persons bringing fodder into a yard or shed, or removing manure from those places. I also advised a periodical inspection of all the dairies in the districts where cattle plague existed or had recently appeared. Further, I advised that the carcase of a diseased animal should be effectually disinfected, and also, when practicable, that it should be buried; if not, that it should be moved, as must be done in the crowded London districts, in a closed conveyance in charge of an officer of the local authority, who should superintend its destruction. Further (which I considered to be most important), it was suggested that the apparently healthy cattle should be killed and dressed on the premises, the hides and offal being disinfected before being removed. Upon this suggestion I laid great stress, from the circumstance which had come to my knowledge, that animals in the earlier stage of the disease had been removed to slaughter-houses and dressed for human food. On one occasion

Chairman—continued.

the chief inspector saw animals affected with the disease in a dairy in the east of London; and he subsequently saw the majority of those animals hanging up as carcases dressed for food in a butcher's shop, not very far from the shed where the disease occurred. The same thing happened in the outbreak at Shepherd's Bush; a number of animals, said to be not healthy but fit for human food (that seems to be the test), were taken to a slaughter-house in the neighbourhood, and a gentleman who had seen cattle plague, or what he believed to be cattle plague, in China, having heard of this circumstance, went to the slaughter-house and wrote me a description of the morbid appearances which he saw in the organs of the animals which the butchers had killed for food; and his description was a clear description of the morbid appearances of cattle plague.

155. There was no doubt, then, that those animals had got the disease?—There was not the slightest question that the animals were suffering from the disease in such a stage that every particle of their bodies was capable of communicating the disease to other animals if brought in contact with them.

156. Would that be the case even when dead?—Certainly; that has been proved by experiment.

157. That is to say, the meat of the dead animal, if infected with the disease, will convey that disease by contact?—It will; but what is more serious, the persons who were engaged in slaughtering those animals are likely to convey the disease, and I account for the outbreak at Willesden upon that principle. That man at Shepherd's Bush, who had diseased animals from the dairy in which cattle plague broke out there, was in the habit of going to the farm at Willesden for the purpose of taking animals which were suffering from pleuro-pneumonia, and other animals which the owner thought it desirable to have slaughtered on account of their being fit for the butcher, or from the fear that the pleuro-pneumonia might extend to them. It is admitted that this person did pay visits to that farm in the ordinary course of his business; if he had gone from the slaughter-house where those animals were killed on to the Willesden farm on that same day or the day afterwards, the outbreak on Easter Monday would be accounted for. We have no proof that he did go, and he asserts that he did not.

158. At the same time there would be the possibility of its being so conveyed?—Quite so.

159. I suppose the destruction of the manure in those places would be an absolute necessity?—Undoubtedly, although I believe the risk of conveying cattle plague by means of manure is considerably overrated. So long as it can be conveyed to land and ploughed in, I do not apprehend that there is much risk of any infection being communicated by its means; but as a matter of common precaution it is absolutely necessary that the manure should be disinfected and destroyed. That necessity has given rise to an enormous difficulty in dealing with the manure, according to the provisions of the Act, in the metropolis and in towns generally. Probably the greater part of the abuse which has been lavished on the Veterinary Department has

taken

Chairman—continued.

taken the direction of complaints about the movement of manure out of the metropolis. We have been over and over again requested to prohibit the movement of manure, not from an infected place (which is done by the Act), but from the metropolitan district; in fact we have been asked to do what is simply impossible, to do what, in fact, was proved to be impossible during the outbreak in 1865. It happened that, owing to a misinterpretation of the orders that were issued, the local authorities round London made regulations to prevent the movement of manure from the metropolitan district into their districts. The result was that in the course of a week or ten days the sanitary officers took very strong measures, and insisted, in short, that the manure should be removed, and I was instructed at the time to make an inquiry. In the course of my investigations, in the midst of the city, about Shoreditch, Paddington, and other places, I saw sights which cannot possibly be described by any terms which I could employ; I saw heaps of rotting manure considerably higher than the tops of the houses in which the people were living; and, as a result of this, it became immediately necessary to inform the local authorities that they had no power to prohibit the movement of manure out of London, and to take steps for its instant removal.

160. What steps were taken?—It was allowed to go in all directions at all risks; it was taken away by barges and carts everywhere.

161. What recommendation did you make in your memorandum with regard to the future dealing with manure?—We recommend that the manure from an infected place shall be rendered as harmless as possible by being mixed with its own weight of quicklime.

162. Do you believe that that would destroy any danger of the spread of the disease?—My impression is that it would, but of course we were not justified in incurring the risk, however slight, and therefore it was further suggested that after this disinfection the manure should be burned, or otherwise in some way destroyed.

163. Burnt, I suppose?—Burnt if possible; we disposed of a great deal of manure at Willesden by burning.

164. Do you suppose that you could enforce any regulation of that sort, which would imply that after a man had taken the precautions which you suggest for disinfecting a thing, he should still take further precautions by destroying it?—We could only enforce it by doing the work ourselves, as we have done at Willesden since the Order was passed giving power to the Privy Council to take action.

165. That would lead them to the central department in all cases taking the control?—Yes; in the case of the metropolis we found it simply impossible to carry into effect the provisions of the Act which prohibit the movement of manure from infected places out of the metropolis, because it would have compelled us to keep the manure in those infected places. That was done until the medical officers very properly interfered, and requested that we should take it away; and, in order to get rid of it, we carted it away into barges, and took it out to sea, and threw it overboard.

166. I suppose those suggestions that you

Chairman—continued.

made would entail a reorganisation of the department; you could not carry out these additional restrictions without a larger staff than you have at present?—No; we should have to take the place of the local authority all over the country.

167. That would require a very large staff, would it not?—It would require a very large staff; I believe something like 2,000 inspectors would be necessary. Under the local authorities there are 1,700 or 1,800, and I consider their staff very insufficient.

168. You would, in fact, assume for the central authority the appointment of all inspectors throughout the country?—Certainly.

169. To go back to the course of proceedings: having traced what you did after the Willesden case, which was on April the 7th and the following days, what next occurred?—On the 11th of April, in consequence of the continued existence of the cattle plague, deputations from the Royal Agricultural Society, and also from the Shorthorn Society, had an interview with the Lord President, and represented to him the importance of the Government at once taking charge of cattle plague in the metropolitan police district, or, as they termed it, in the home counties. On the following day, the 12th of April, an Order was passed giving the Privy Council power to deal with the cattle plague in the whole of the metropolitan police district.

170. Did that come into force immediately?—It came into force on the 16th of April.

171. Was that restricted to cattle plague, or did it supersede the local authority in other matters?—It was restricted entirely to cattle plague.

172. Had you under that Order to appoint inspectors?—We appointed 12 inspectors, who were placed under the direction of the three travelling inspectors who had acted all along; Captain Tennant took four men under his charge in the Willesden district; Mr. Courtney took four men under his charge in one part of the East of London; and Mr. Ricketts took four under his charge in another part of the East of London.

173. What instructions were given to those inspectors?—They were instructed to make inquiries at all the dairies and dairy farms for the purpose of ascertaining the sanitary state of the animals in those places; they were cautioned not to insist upon entering premises or examining animals unless there was reason to suspect disease; they were told to provide themselves with waterproof clothing, including coverings for their boots; and they were distinctly cautioned not to move from any premises where they discovered cattle plague to exist until they were relieved. The working of that system was this: If an inspector found cattle plague, he telegraphed to the Veterinary Department; he remained at the place until the chief inspector had made his visit; and, if cattle plague was confirmed, he took charge of the herd and stopped at that particular point until the animals were disposed of, and the premises were perfectly cleansed and disinfected.

174. Had he power to prohibit ingress?—He had no such power; but his instructions were not to allow persons to go out who insisted

Professor *Brown.*

11 May 1877.

Chairman—continued.

on coming in, unless they submitted to a process of disinfection; and I particularly directed that all persons who did enter such premises, and wished to leave them again, should have their boots thoroughly sponged with chloride of lime solution, and then covered with quick lime, and that they should be dressed from head to foot with chloride of lime and water. One man at Bayswater refused to submit to this, and his name is now before the Treasury for prosecution.

175. Was that a man employed about the place?—No, he had no business there at all; he came in as a matter of curiosity.

176. Did he come from a scientific point of view as a matter of curiosity, or merely as one of the ordinary public?—He did not give any reason for his entrance.

177. Was he a veterinary surgeon?—He was described as a farrier and the owner of a forge in the neighbourhood.

178. Your regulations prohibit also the removal of the hides and offal, do they not?—They do. This appears to be an excess of precaution, because hides could be rendered perfectly harmless by a preliminary process of dressing; but as we hoped not to have to deal with any very large number of animals, it was thought safer, and at any rate more simple, to put them at once underground.

179. So that your regulations, in fact, were even stricter, perhaps, than was necessary in order to make quite sure of the prevention of the spread of the disease?—In that particular they certainly were.

180. I understood you to say that a good deal of the meat of those animals found its way into the market; is it easy to detect meat that comes from a diseased animal as compared with the ordinary meat that is hung there?—Under certain conditions it is simply impossible. I have seen meat from animals affected with the disease presenting all the appearance of perfectly healthy beef of the very first class. I saw, during the outbreak of 1865, Scotch animals in the metropolitan market slaughter-houses showing all the characteristic signs of the disease; I saw them slaughtered, I saw the meat dressed and hung up, and I examined it on the following day for the purpose of ascertaining whether I could discover any indication which would enable me to say that the meat was that of an animal affected with the cattle plague, and I found that I could not. The meat was sent to market and fetched its full price; so that it is quite evident that the meat inspector could not.

181. Were those animals in which the disease had been developed before they were slaughtered?—In these cases the disease was fully developed.

182. I understood you to say just before to have stated that a gentleman, I think from abroad, went and viewed certain pieces of meat hanging up, and that from what he saw of the meat so hanging, he described symptoms which led you to say that the animal had died of cattle plague?—No, that was from the examination of the organs of the animals, and not from the meat.

183. From the meat you would not be able to detect the disease?—Not in these cases, but where the disease is very far advanced there are certain conditions of meat which would lead you

Chairman—continued.

to suspect. It becomes what the butchers call "fiery," assuming a very dark red colour, and there is emphysema, or extravasation of air under the tissues of the back and shoulders; but those conditions are only present in very extreme cases.

184. There are no conditions which would lead you to be sure that the meat of those animals would be condemned as unfit for human food?—Not on account of cattle plague; but animals, I will not say healthy, but perfectly free from cattle plague, may be, and constantly are condemned as unfit for food, simply from the circumstance that they are in a state of debility; and under those conditions, the meat remains damp, and has a most unwholesome look, and is probably more unwholesome than the meat of an animal in first-rate condition, which is at the same time subject to cattle plague. The inspectors were instructed to condemn all animals so diseased, if there was an increase of temperature, which is the earliest signs of the existence of plague.

185. I suppose you mean a sudden increase of temperature?—A sudden increase of temperature; without some such test, we were not authorised in returning animals as affected with disease, and consequently we could not condemn them; and therefore it happened that some carcases, which were those of perfectly healthy animals so far as cattle plague was concerned, were condemned in the market as unfit for food; but wherever it was possible, we have got the medical officer of the district to examine the carcases of the healthy animals, and when he has condemned them, we have immediately ordered them to be destroyed or buried.

186. Will you now describe the action of the inspectors after the Order of April the 16th came into force?—They proceeded to inquire as to the condition of animals in their several districts, and they reported every day to the travelling inspectors, and the travelling inspectors reported every day to me. When cattle plague was discovered, the usual course was, that the inspector remained there until the work was done, and in addition to that, Mr. Courtney generally took charge of the arrangements for slaughtering; he obtained closed conveyences, and a staff of slaughtermen, and continued the work without intermission, until the whole of the animals were disposed of.

187. With regard to the entry on the premises, had the inspectors power to enter all premises?—They had power to enter if they had reason to suspect the existence of cattle plague.

188. But I understood you to say that as soon as the April Order came into force the inspectors were instructed to make a general inspection of the dairies of the metropolis?—They were instructed to make a general inquiry, but they are distinctly told not to enter premises unless they have good reason to suspect disease, and never to enter without the consent of the owners.

189. Was there any difficulty thrown in their way?—In a few cases the owners of dairies objected to allow them even to look in at the doors.

190. To that extent, therefore, the powers are deficient if you wish to take the necessary precautions for ascertaining that the disease does not exist in a town?—To that extent, they are.

Of

Chairman—continued.

Of course the difficulty could be overcome by the inspector simply writing a certificate to the effect that he had reason to suspect disease. That would be a mere legal form which would give him power of entry.

191. He would not be justified in doing that unless he really suspected the existence of the disease?—Certainly not.

192. Almost immediately on the coming into operation of this Order, another case of cattle plague broke out, did it not?—The first case after the coming into operation of the Order was on the following day, April the 17th, when a cow and two calves were found to be affected with cattle plague in the Willesden district.

193. Was that at the same farm as the original outbreak?—Not at the same farm, but in the infected place, that is to say, within the mile radius.

194. Within the area of the circle that had been drawn round it?—Yes.

195. Were many animals affected by it at that time?—There were only a cow and two calves on the premises; they were seen by the chief inspector at one o'clock, and under Captain Tennant's direction they were all buried, and all the sweepings of the shed by seven o'clock the same evening, and all the manure on the premises was buried by eight o'clock the next morning, and the sheds were nailed up until the disinfecting process could be applied.

196. Have all the sheds in the east of London been visited by this time?—The sheds have been visited throughout the greater part of the metropolis.

197. Has any disease been detected during those visits?—None in the east of London, but there have been one or two cases in the north.

198. We have not done with the Willesden outbreak yet I think, for there was another on the 21st of April, was there not?—There was another on the 21st of April amongst 65 cows; in this case, the notice of the disease was not given until the animal was dead or dying; it was found dead when the inspector arrived, and five others were found to be diseased.

199. Did that notice come from the owner?—That notice came from the owner to the police late at night. On the following morning the cow was found dead.

200. And that happened before your inspector arrived?—Before he arrived; he found five others diseased on his arrival.

201. Were those animals slaughtered?—They were all slaughtered, healthy and diseased, as quickly as possible; I think in 24 hours, they were all disposed of.

202. Have you been able to trace in any way the origin of that outbreak?—No; the disease occurred in the infected place, and there is no room at all for doubt that persons who had been on the other premises, or in some way in contact with diseased animals, had also been in contact with these; but in all these instances it is difficult to get information, because the persons who are likely to have conveyed the disease would naturally be very indisposed to make any statement which would identify them with the outbreak.

203. But all that possibly occurred before the Privy Council took the charge of the district, before their rules with regard to disinfecting came in force?—Quite so.

204. That was an outbreak on the 21st of April; there was another on the 22nd, I think?—On the 22nd an outbreak occurred in the western part of the metropolis, in Ledbury Mews.

205. That was a considerable distance from where any of the previous outbreaks had taken place, was it not?—It was; but it was probably connected with the outbreak at Shepherd's Bush. The owners of the animals in Ledbury Mews had a dairy farm in the metropolis, in the Acton district; his lease expired, I think, on the 9th of April, and he consequently sold off all his stock; 14 of the animals were either not sold or were not taken away, and he consequently retained them in his possession; obtained a licence for a cab stable in Ledbury Mews, converted it into a cow shed, and put those 14 animals there. About a week after they were brought in one of the 14 animals was found to be ill. It was presumed to be affected with pleuro-pneumonia, but, from what we have since ascertained, there is little or no doubt that it was affected with cattle plague. It is a matter of certainty that it was not affected with pleuro-pneumonia, and the local inspector who examined it stated his impression at the time that it was affected with cattle plague.

206. Was that your own inspector?—No, an inspector of the local authority.

207. But this was subsequently to the time when the Department had taken the control, was it not?—This first cow was killed on the 17th of April, the day after the Department took charge of the cattle plague; and although the animals in the shed appeared to be healthy they were kept under observation. It was not until the Saturday that they gave any marked evidence of disease, and on the Sunday morning the whole 13 were found to be affected; but in each instance the disease was quite in the early stage.

208. And they were all destroyed, I think?—They were all destroyed; but I ascertained that the sale was held a fortnight previously, and in the neighbourhood of Shepherd's Bush. There is scarcely room for doubt, I think, that the same butcher who had been concerned with those diseased animals, of which I have previously spoken, and some of his men, at any rate persons from the Willesden district, where cattle plague had been raging up to that time, were attending at the sale. We have not succeeded in getting a list of the names, but it can hardly be questioned, when a thing of that kind took place, that all the persons in the neighbourhood who are concerned with stock, at any rate look in for the purpose of seeing what is going on; and there can be no question at all that the animals took the disease at the time of that sale. The outbreak that occurred some six days afterwards proves that to demonstration.

209. Those were cattle that had not been sold on the occasion when the owner removed to the other place?—They were.

210. Did you trace the cattle which had been sold on that occasion?—We ascertained the destination of some of them, but there has been no

Professor *Brown.*

11 May 1877.

Chairman—continued.

outbreak in any place where the remainder of the animals were taken, as far as we know.

211. The next outbreak was on the 23rd of April, the next day, was it not?—It was in the Kensal Green district, just on the confines of the boundaries of the Willesden infected place. On those premises there were 75 cows; two were attacked, and one of them died before it could be slaughtered.

212. Did you get the information in the same way, from the owners?—The information was given by the owner to the police.

213. Did you get that information in time, so that your inspector was there before the animal died?—The inspector, I believe, arrived before the animal died, but the animal died before arrangements could be made for slaughtering.

214. I suppose all the animals there were slaughtered too?—All of them were slaughtered.

215. The next day another outbreak occurred, I think?—Another outbreak occurred on a farm in the occupation of a brother of the man whose stock were first attacked in the Willesden district.

216. And that was on a farm where there were a very large number of cattle, was it not?—There were 124 cattle there. One was found to be diseased, and it was ascertained that some from the same herd had been sent to the Metropolitan Market on the day of the discovery of the outbreak.

217. No trace, I suppose, has been found of what happened to those beasts?—We ascertained that they were all sold to metropolitan butchers.

218. Were they sold for slaughter?—They were sold for slaughter.

219. There was a possibility in that way of disseminating the disease?—Undoubtedly.

220. I think the next outbreak in sequence took place at Stoke Newington?—The next outbreak occurred on the 1st of May at Stoke Newington, in the north of London. There were 49 cows in that shed.

221. Did you trace the commencement of the disease there to any contact with other places?—No, we have not found any clue at all to the origin of the outbreak there; it is known that several animals had been removed from the shed at Stoke Newington shortly before on account of pleuro-pneumonia, but we can only suspect that some of the butchers who were concerned in this removal had conveyed the infecting matter.

222. That again is evidence of the danger which appears in all these cases, viz., that the contact with people moving about in their different trades spreads the disease in a way that you cannot prevent?—That is so.

223. Then I think the 5th of May was the next time on which the disease showed itself?—On the 5th of May a report was received of an outbreak in Hull.

224. And that was after a lapse of some weeks since the last outbreak there?—A lapse of something like six weeks.

225. Were there many beasts attacked in that case?—There were five animals in the shed, and one was attacked.

226. Have you discovered any cause for that?—At present there is no cause whatever to connect this outbreak with the previous existence of the disease.

Chairman—continued.

227. Did you send an inspector from the department down there?—I immediately, on receiving information of the outbreak, telegraphed to Mr. Duguid, of the Brown Institution, whose services had been placed at our disposal by the Royal Agricultural Society, to ask him if he could go, and I telegraphed to the inspector at Hull to ask whether the animals were alive. I thought it probable that they would all have been slaughtered, and under such conditions, of course, no investigation of any value could have been made. I heard that the animals were still alive, and would be kept alive until an inspector arrived. Mr. Duguid went to Hull upon the same evening by the night train. He stated to me that the symptoms in the animal while it was alive were doubtful; but on post-mortem examination he obtained what, in his mind, was perfectly satisfactory evidence of the disease. I asked him particularly if he thought that the matter could be left as doubtful, but he said that, from the appearances which he discovered, he could not entertain any doubt whatever upon the subject.

228. Were you satisfied in your own mind, from the evidence that he gave you, that it was a case of cattle plague?—No, I must confess that I was not satisfied, for the reason that during the outbreak which lasted from 1865 to 1867, it was part of my duty to investigate the supposed outbreaks all over the kingdom, and also in the Isle of Man. I met with instances where the evidences of cattle plague were so decided that a conference of inspectors was held over the animal's carcase, and they unanimously concluded that the disease was cattle plague. I found that in Cheshire. The post-mortem appearances afforded a justification for this opinion, but I have met with so many cases where the morbid appearances of cattle plague were present, and where at the same time it was evident from the surrounding circumstances that the disease was not cattle plague, that I entirely lost my faith in evidence of this kind. In the case which I referred to in Cheshire, which is one of a number, I reported to the Government that the disease was not cattle plague. The five or six inspectors who were consulted reported that it was cattle plague. The local authority ultimately decided that they would wait the event. There were a large number of animals on the premises in the field where three had been attacked, and they decided to test the view by keeping the animals alive. I believe one or two others were attacked with the same affection, and it then ceased, and no more cases occurred.

229. That was in 1865, in the first outbreak of cattle plague?—It was during the first outbreak of cattle plague; I may say that in the Isle of Man, if I had drawn my conclusions from the post-mortem appearances, my opinion would probably have led to the destruction of a third of the stock in the island; I felt quite convinced from the first post-mortem examination that I had cattle plague to deal with, but I had previously got into the habit of dealing with the case as a whole; I was not in the position of the inspector of a local authority, who is bound to say at once whether it is cattle plague or not, and I therefore refrained from giving any opinion at all until I had sufficiently investigated the

Chairman—continued.

the particular case. Before I had been in the island a week, I satisfied myself that the disease could not be cattle plague.

230. Notwithstanding your first impression?—Notwithstanding my first impression.

231. Were you then on a tour of inspection for the department?—I was sent to the Isle of Man in consequence of a report which had been made by the local inspector, and which I think from the appearances he was quite justified in making, that cattle plague had got into the island. The Governor of the Island telegraphed to the English Government, requesting that an inspector should be sent over; and after the inquiry was completed, I reported that the disease was not cattle plague, but a non-contagious affection.

232. Notwithstanding your first belief in the disease, you satisfied yourself, by the test of time, that it was not a contagious disease at all?—Quite so; I found that in all parts of the island cases had occurred among herds varying in number from 10 to 30 or 40, and I ascertained that the disease had ceased after the occurrence of one or two cases; that fact in itself was quite sufficient to preclude the idea of the disease being contagious; and not being contagious, of course it could not be cattle plague.

233. Does not that throw some doubt upon the results of post-mortem examinations; because I understood you to say, that on the post-mortem examination that you first made, you satisfied yourself as to the fact of its being cattle plague?—I satisfied myself so far as it was possible to be satisfied from a post-mortem examination.

234. You would tell the Committee that in your opinion, a post-mortem examination is not an infallible guide as to the existence of the disease?—I have already stated that, and in the report which was written by Professor Simonds and myself in 1868, we both concluded from our independent investigations all over the kingdom, that it is in many cases not possible to decide from the symptoms during life, added to a post-mortem examination, whether an animal is affected with cattle plague or not.

235. And it is from the experience which you gained in 1865, that you have doubt in your own mind with regard to the outbreak of the 5th of May at Hull, having been really an outbreak of cattle plague, notwithstanding the report of the inspector?—I have, for the reason that the evidence derived from a post-mortem examination does not satisfy my mind. I have no doubt at all that the evidence of the existence of the disease was very strong, because Mr. Duguid has had large experience; he was engaged during the prevalence of the disease in 1865, 1866, and 1877, in conducting various experiments while the Royal Commission was sitting; and he has been concerned largely in post-mortem examinations and in the examination of animals affected with disease; but all I can say is that the evidence which satisfies him and others who believe that the evidence of a post-mortem examination is sufficient does not satisfy me, in consequence of the circumstance to which I have referred, viz., that in so many instances I have found all the evidence which he found, and the after circumstances have proved that the disease was not cattle plague.

236. And in this case, the cattle plague having

Chairman—continued.

disappeared for so many weeks there, and no fresh cause having been given for its re-introduction by importation, the probability in your view is, that the symptoms were misrepresented?—I think it at any rate probable.

237. This herd at Hull only consisted of five beasts, I think?—Five cows.

238. What was done with the others?—They were all slaughtered immediately that Mr. Duguid decided that it was cattle plague.

239. They were all slaughtered, and treated as infected cattle?—At once. In such a case, in order to justify the statement which I have just made as to the doubt in my mind, I should like to suggest to the Committee the course which I should myself have adopted. I first of all start with a knowledge of the fact that there has been no cattle plague known to exist there for six weeks, and that all the sheds where it has existed have been cleansed and disinfected, and the premises declared free. I should have gone into the inquiry with the firm conviction that it could not be cattle plague, and I should only have yielded that conviction upon the most overwhelming evidence. In the first place, I should not have gone near the shed at all until I had made inquiries over the whole of the dairies in Hull; I should have found out whether any persons had got rid of their stock. That inquiry is now being carried on, and we shall hear more shortly. Finding that everything there was intact, and that there was no reason to suspect that any disease had continued there, I should then have examined the healthy animals in the shed before I had gone near the diseased ones. In certainly 99 instances out of every 100 I should have found one or two of those remaining animals with a temperature indicating the existence of fever, a temperature of 105°, or above.

240. Showing signs that they were equally affected?—Quite so.

241. I infer from your present statement that this was not the course pursued by Mr. Duguid?—No; he decided from the single case, and the local authority acted upon his statement, which of coarse they were bound to do, and which undoubtedly was the most cautious mode of proceeding. Having ascertained the state of the healthy animals, I should then have examined the diseased one, and even if I had found the symptoms indicative of cattle plague more pronounced than they were, I should not then have admitted the idea into my mind that it was cattle plague. I should have had that animal destroyed, and have made a post-mortem examination, and got what farther evidence I could from that. I should then have shut up the remaining animals, taken the key of the door in my pocket, and I should have remained there, or made repeated visits, or placed some one to take charge of them, until every one of them had had the disease. I should have done that in this case, because the principle involved is most serious. If it is possible for an outbreak of cattle plague to occur six weeks after a place is declared free without any palpable evidence of communication being obtainable, the question naturally arises, when are we to consider ourselves free?

242. But there was a considerable interval, was there not, between any outbreaks in several of the cases to which you have already referred.

Professor *Brown.*

11 May 1877.

Chairman—continued.

In the Lincolnshire case there was a considerable interval, was there not?—There was; and that is one of the cases which I should have dealt with in the same way.

243. You had in your own mind doubts also as to this outbreak being really cattle plague?—I had doubts on that ground.

244. Can you state what interval there was between that outbreak and the one which preceded it?—The outbreak occurred in Lincolnshire on March the 8th.

245. I forgot to ask you whether any attempt was made to trace that outbreak in Lincolnshire?—An inquiry was made with that view, but no evidence whatever was obtained.

246. There was no evidence of contact in any way with the previous outbreak of disease?—None whatever; but in that case several animals were found to be affected.

247. And there was no trace of animals having been brought recently into that farm?—No; it is quite certain that no introduction of fresh stock had taken place for some months.

248. And that led you to form, with regard to that outbreak, a similar opinion to that which you have expressed to the Committee with regard to the outbreak at Hull?—It did.

249. With regard to the Lincolnshire outbreak, was the decision that it was cattle plague come to by the local inspector or by the Government Department Inspector?—The local authority inspector, who had considerable experience in the last outbreak, decided at once that the animals were affected with cattle plague.

250. Was his opinion strengthened in his own judgment by the post-mortem examination?—I believe there was no post-mortem examination made; but the chief inspector from the Veterinary Department was sent down at once. He saw the animals which were diseased; three or four animals, I think, when he arrived were diseased; and he was perfectly convinced also from the symptoms that it was undoubtedly cattle plague.

251. Was any post-mortem examination made in the case of any of the animals?—I believe, in fact I am quite certain, that there was none. In this case there was, of course, a possibility, and even a probability, of the infection being conveyed from Hull, because the disease had been prevailing there since February the 15th, and had continued up to March the 22nd.

252. And it broke out in Lincolnshire on March the 8th?—Yes.

253. I understood you to say that those who have inquired into it have not been able to trace any cause for this outbreak, either by the introduction of fresh animals or by their knowledge of people having been in contact with the Hull infected district?—None whatever.

254. Inquiry was made with a view of ascertaining it?—Yes, very close inquiry. If it could have been shown that the persons had come from the dairy in William-street, where the disease broke out on the 27th, or that any persons from the farm had visited that dairy, or had even gone to Hull at that time, there would have been a connecting link; but it was stated that the men on the premises had not been to Hull for a considerable time, and that the greatest care had been taken to prevent persons from coming on to those premises; and there is the further fact,

Chairman—continued.

that although three animals were attacked before the disease was identified, no extension of the infection took place.

255. This Hull outbreak brings us down to May the 5th; the last outbreak in the metropolis is considerably further back; has any subsequent sign of the continuance of the disease been shown in the metropolis, to your knowledge?—Up to this morning the report is, that all the dairies as to which inquiries have been made are perfectly free.

256. There has been no symptom, to your knowledge, of any continuance of the disease since the 1st May at Stoke Newington?—No, that is the last case.

257. There has not been sufficient lapse of time, therefore, to enable you to consider the metropolis safe from a fresh outbreak?—No, we can hardly consider the metropolis safe for something like a month, because it is possible that individuals may have carried some infecting matter away with them, and it is possible that its vitality may have remained during that time, but it is not very probable.

258. Is there also a possibility that in some of those sheds where you were not able to make an inspection, from the refusal of the proprietors to admit you, the disease may be being perpetuated?—It is quite possible that animals may have been attacked and removed to the butchers on the plea of pleuro-pneumonia, and in that way the disease would escape our notice for a time. I should like to say, in reference to the evidence of cattle plague, that I am not dealing more hardly with the inspectors who have been concerned in those cases which I have termed doubtful than I am dealing with myself; because I look back to several instances where I am firmly convinced that I have slaughtered a lot of animals unnecessarily, where I have decided upon evidence that I should not decide upon now.

259. What you represent is, that in cases of this sort you would now wait until you have cleared up all this outside evidence before you really attacked the disease itself; whereas they go into it with the belief that, as disease exists, it probably is cattle plague, and they look at it from that point of view first?—That is what I mean, and I acted upon that principle not many days ago in the metropolis. A case was reported where the symptoms of cattle plague were so far developed that it was said that there was no doubt at all about it.

260. Where did it take place?—In the north of London. Perhaps I had better not mention the name of the individual.

261. Was it subsequently to the Stoke Newington outbreak?—Yes, but in that instance there was no possible way of accounting for the disease. Some of the symptoms described to me were not those of cattle plague, and my instructions were to keep the place under supervision, and leave the animal alone. It died, and a post-mortem examination resulted in the detection of certain lesions which were strongly suggestive of cattle plague. I still said: "Let the animals alone;" there were a large number in the shed, between 60 and 70; and the result has been that up to this morning all those animals are perfectly healthy.

262. Have precautions been taken, with regard to that shed, to prevent the contact with other

cattle

Chairman—continued.

cattle by the movement of people?—Yes, every precaution that was considered necessary, supposing the disease to have been cattle plague, has been taken.

263. Whilst waiting to decide as to the disease, you have treated the shed and the ground as if it were an infected place?—We have, and I may add that Professor Simonds was kind enough to attend the post-mortem examination of this animal, and he informed me that there were circumstances which led him to suspect that it might be cattle plague. At any rate the case was sufficiently serious to justify the premises being dealt with as though it were, until it is proved that it is not.

264. I understand you to say that the symptoms which were described to you, and also seen by you in the post-mortem examination, indicated cattle plague?—They were of such a kind as would justify an inspector generally in deciding that the disease was cattle plague.

265. In suspecting it?—I would go further than that, and I would say, even in deciding, if he derived his opinion from the appearances which he discovered in the animal, quite irrespective of any other considerations.

266. How many days have elapsed since the death of that animal during which the rest of the herd have remained sound?—Some 11 days, so that what was presumed to be the case, is a matter of fact, viz., that the animal was not the subject of cattle plague.

267. In fact, if from four to seven days is taken as the time of incubation generally, I suppose you are fairly satisfied by the lapse of time that your first impressions were erroneous?—It was not my impression, because I did not see the animal; but I am satisfied that the first impression was an erroneous one, and that the animals, so far as that case is concerned, are free from the slightest risk of infection.

268. That strengthens your opinion that, as you have stated, it is quite possible that in some of those other instances similar results might have followed upon the same course of action?—Quite so. But of course when it is known that cattle plague is existing in a district, anything like excess of caution is not advisable. I should always instruct the inspectors to act on suspicion from fear that they might, from being too cautious, make a mistake in the wrong direction. I should always forgive a man for killing animals unnecessarily, but I should never forgive him if he allowed diseased ones to escape.

269. Have you had any information in the department or otherwise as to the continuance of disease on the Continent in those places from which these animals come?—We have had regular information from Germany since the telegram on the 9th January. On that date the disease existed in two villages in Upper Silesia in the Oppeln district.

270. That is the same district from which the first affected animals came?—It is. Then on the 15th January we received the intelligence of the existence of cattle plague in the Altona market, which is in the Holstein district, bordering on the Hamburg frontier.

271. Are you aware whether that was traced to the same source in Silesia?—I am informed that the man who had the disease in his sheds bought animals in Berlin which were known to have come from the Silesian district.

Chairman—continued.

272. Were those the cattle that you described as standing in the market at Berlin at the same time that infected cattle were being sent here?—They were bought by this man and taken into his sheds.

273. Is that all the information that you can give us with regard to what has taken place since on the Continent?—No, I have here the whole information of the progress of the disease through Germany.

274. Will you state what has been the progress of the disease from the time when it first broke out?—On the 16th January, cattle plague was detected in the market at Breslau, supposed to have been brought there by a dealer who purchased animals in Silesia. On the 22nd January we had further information from Hamburg, that the disease was said to be still spreading, and in one case it was detected on an island in the Elbe, and cases were also actually detected in the cattle market, where 13 cattle were slaughtered, and all the stalls and fences about the market were burnt down. The total number of cattle slaughtered since January in Hamburg was 300, at a cost to the Imperial Treasury of more than 15,000 *l*. On the 18th January, cattle plague was detected in Berlin in the cattle yard. On the 20th it was detected among 32 oxen near Breslau; on the 22nd, among nine oxen near Leuthen; on the 23rd, among three oxen again near Breslau; on the 25th it was detected in Holstein in a herd of 11 cattle; again on the 26th, it was detected in the same district among 28 cattle; and on the 27th in the same district among 13 cattle. On the same day a further case occurred in the Oppeln district among two cattle; on the 30th January the disease again appeared near Breslau among 47 cattle; it was detected in Dresden on the 5th February, and also in Hamburg, and at Cologne, where it was introduced by a herd brought from Dresden.

275. Then it is spread generally throughout the district?—It is extended over the greater part of the district from the eastern to the western frontier. On the 7th February it was reported from Potsdam, and from the town of Emden, which is very close to the Netherlands frontier. Its appearance in that town led to the passing of an Order in this country, putting cattle, sheep, and goats from the Netherlands in the schedule. Although, at the time, Holland had strictly prohibited the importation of all animals from Germany, and indeed from any other country, it was thought that the proximity of the disease made the risk of its introduction so great, that it would not be safe to allow those animals to go free. On 8th February, the disease was reported at Arnsberg. On the 8th and 10th, 27 cattle and five sheep were attacked at Emden.

Mr. *W. E. Forster*.

276. That is uncommon, is it not?—I think there were something like 100 sheep attacked in Germany, altogether.

Chairman.

277. We have never had an introduction of cattle plague that could be traced to imported sheep, have we?—

Professor *Brown.*

11 May 1877.

Chairman—continued.

we?—No; we have had the disease in sheep in this country extensively in something like 20 counties, I think, during the former outbreak, but we have never had it introduced by sheep. The cattle plague appeared again at Dresden on the 10th February and on the 14th February; again in Herzberg, with cattle brought from Dresden, on the 13th February; it appeared at Cologne again on the 15th; at Emden again on the 15th and 18th; near Breslau again on the 17th and 19th, in two herds consisting of 13 and 35 head of cattle respectively. On the 15th it was detected in Saxony, at Seidan, in one cow which was brought from a slaughter-house in Dresden; and on the same day it appeared near Leipzig, in two farmyards, in 15 head of cattle. At Dusseldorf, on the 21st and 23rd of February, two cases occurred in a herd of 90 cattle. In Seltow and Potsdam, it was detected on the 22nd. Further outbreaks occurred in Saxony on the 23rd, the 25th, and the 27th. Again it appeared at Emden, on 4th March, in a herd of 15 cattle, and in this outbreak eight sheep were also found to be affected. Since the disease entered Germany, outbreaks occurred in about 50 different places; the number of horned cattle infected and killed amounted to about 1,000, and there were in addition several hundreds of sheep killed either in consequence of having the disease themselves, or in consequence of having been herded with those which were affected. Further outbreaks occurred in the kingdom of Saxony, on the 11th and 12th March. The case on the 12th March was the last, and the German Empire was declared free from cattle plague on the 10th of April.

278. So that it has practically ceased in Germany?—It practically ceased in Germany on the 12th of March.

279. Then it took from the beginning of January to the 12th of March before they were able to stamp it out in Germany?—It did.

280. Are you satisfied from the time that has elapsed that in all probability it is stamped out in Germany, as stated?—Considering the severe regulations which they adopt, and their very careful system of inquiry, I think there can be no doubt about it.

281. They have carried out a very severe system since the disease was introduced in Germany, have they not?—Certainly, far more severe than anything that would be tolerated in this country.

282. Have they closed their country for importation?—Yes; they stopped not only importation, but also exportation.

283. They stopped all movement throughout the country?—Entirely; and they also adopt the system of declaring a place infected for 20 kilometres round the seat of the disease.

284. They draw a cordon round each outbreak?—Yes, for that distance, and in that district trade in cattle and transport of dung, fodder, straw, and other litter materials are only allowed by special permit.

285. What regulations do they lay down with regard to the moving of people out of those infected circles?—They insist that the farmyard in which the disease has appeared shall be entirely separated and watched by watchmen, who must not enter the place or communicate with the inhabitants, and must not allow the ingress or

Chairman—continued.

egress of persons except those legally authorised, nor of animals living or dead. Authority to enter infected farms is only given to persons engaged in extirpating the disease, and to clergymen, law officers, doctors and midwives, in the exercise of their profession.

286. Are those people required to disinfect themselves?—It is insisted that they must be properly disinfected before they are allowed to leave; I may state that complaints have been made about the permission which is given to clergymen; it is said that clergymen, of all people, are those who are most consulted by the poor, and that if any man has a cow sick he is quite sure to ask the clergyman's advice about it; so that in that way it is quite probable that the disease can be extended.

287. The clergyman is, therefore, the readiest means of contagion?—Yes; but we have the stern fact that they always do deal with cattle plague effectually, however it may spread, and get rid of it in a short time.

288. And those are regulations which before the last Committee we had evidence had been for many years in force in Prussia, before Germany became united?—Quite so.

289. At present these regulations extend to the whole of Germany, and Schlezwig-Holstein too, of course, as part of Germany?—Wherever the cattle plague appears in Holstein the same regulations are applied, but it seldom gets many miles through the country. I believe on the last occasion it extended to a distance of something like nine miles only before it was effectually arrested.

290. Notwithstanding these stringent regulations it has taken three months, as you have described, to stamp the disease out?—It has.

291. I suppose all these diseases have reached us from the Continent in their turn, have they?—One would conclude that that is the case, from the fact that they all had a prior existence on the Continent, although foot-and-mouth disease and pleuro-pneumonia were both introduced into this kingdom during the time that the importation of foreign animals was entirely prohibited.

292. You mean by that, that before 1842 they prevailed to a considerable extent?—Foot-and-mouth disease was certainly present in this kingdom in 1839, and pleuro-pneumonia in the latter part of 1840, and before 1842 they had both of them attained a very considerable degree of prevalence in this country.

293. Sheep-pox was not introduced, I think, until after the free import of cattle had taken place in 1846?—Not until 1847; that is to say, speaking in reference to our own times, because there are historical accounts of all these diseases; at any rate of cattle plague and sheep-pox, having been introduced in former centuries.

294. But taking the last 100 years it did not appear until that date?—Taking the last 100 years sheep-pox was not introduced until 1847.

295. How was it stopped then?—It prevailed for some considerable period, and it was not, I believe, finally extirpated until about 1852.

296. What steps were taken for arresting it; was there any compulsory slaughter at that time?—There was no compulsory slaughter; slaughter was adopted in many cases where animals were *in extremis*, but generally the disease was treated and

Chairman—continued.

and inoculation was practised to a very considerable extent.

297. Then it returned again in 1862, did it not, after having been stopped in 1852 by these methods?—It did, and also in 1865 and 1866.

298. That was after the cattle plague had come into the country in 1865?—It was. The last two outbreaks were during the time that the cattle plague existed.

299. Since 1866, have we had any introduction of it into the country?—We have had the disease introduced from abroad, but it has not extended beyond the landing-places.

300. You have been able to stop it by slaughter at the port of landing?—We have.

301. With regard to cattle plague, in your opinion, has the slaughter which was adopted under that Act, at the place of landing, protected us sufficiently from the possibility of the introduction of that disease?—It is quite evident that it has not. In fact the prevention and interdiction of the landing has not protected us, when animals affected with cattle plague have been brought close to our coast.

302. In consequence of the facility that there is for mediate contagion?—Quite so.

303. With regard to these precautions, as affecting pleuro-pneumonia and foot-and mouth diseases, what has been the result?—I believe that in reference to foot-and-mouth disease the present restrictions prevent the introduction of the infective matter to any serious extent. I have no doubt that a certain number of outbreaks are traceable to the introduction of infected foreign animals, but I do not believe that the prevalence of the disease in this country has anything whatever to do, speaking generally, with its introduction from abroad.

304. You believe that it is naturalised in the country to a certain extent?—I believe it is so far naturalised, that as long as we supply new material the disease will go on.

305. And you think that no stoppage of importation would affect, to any great extent, the present prevalence of these two diseases?—I think that that point is as nearly as possible proved by the example afforded us in other countries.

306. Do you refer to the colonies?—In the colonies, and in Australia particularly, the disease was introduced something like 20 years ago; they do not import, or, at any rate, not to any extent. Australia is not an importing country, but since the time of its introduction the disease has continued to prevail there. The same observation applies, though not perhaps to the same extent, to Ireland, where comparatively few animals are introduced, and where, notwithstanding, the disease, since it was introduced in 1840, has continued to prevail. The Netherlands affords another illustration. The Netherlands Government has for some five or six years prohibited the importation of stock from other countries; they have made the most strenuous efforts to eradicate the disease; they insist upon the slaughter of diseased animals, and the inoculation of the rest of the herd; but, notwithstanding those precautions, pleuro-pneumonia still exists in the Netherlands, although its spreading has been considerably controlled. I look upon the idea of the disease (either pleuro-pneumonia or foot-and-mouth disease) dying out as a pure myth. The suggestion that if you stop the supply from abroad the affections will die out is, to my

Chairman—continued.

mind, entirely incomprehensible. I do not see on what plea it can be said that a disease will die out, when you perpetually supply it with new material in your own country.

307. And you instance the case of Holland as one proof of it?—Holland, and Ireland, and the colonies, particularly Australia.

308. Holland and Australia are the two principal places, because in Australia importation is stopped altogether, as it is in Holland?—Yes.

309. What measures would you suggest to prevent the introduction of this disease?—I should make certain alterations in the present system of dealing with these diseases, or I should make a radical change, abandoning the present system altogether, and adopting an entirely new one in its place.

310. What would that be?—First of all, having regard to the existence of these two diseases in this country, I should feel bound to impose very severe restrictions upon the cattle trade. Both in reference to foot-and-mouth disease and pleuro-pneumonia, there can, I think, be no question whatever that the infective matter is chiefly conveyed through the movement of diseased and infected animals. Therefore I should be obliged to adopt such a system as would entirely prevent this movement. In order to do that, I should be compelled to divide the whole country into districts, placing each one in charge of an inspector, who would be in constant communication with the central department. Having found all the centres where either disease exists in the district, it would be absolutely essential to prevent the movement of animals from those centres during the continuance of the disease.

311. That is, dealing with it here?—Dealing with it here. Then having arranged that no animals should be removed from a place where disease prevails, and to that extent preventing its dissemination, I should adopt certain arrangements with a view to preventing its reintroduction from foreign countries. First, I should schedule all countries where pleuro-pneumonia exists. I should refuse to allow any countries to be taken out of the schedule, unless they could prove that they were free from disease at the time; and further, that they had such regulations in their country as would in all probability prevent the introduction of disease from other countries.

312. You would require that they should be, as Holland is, a non-importing country?—In the first place; and in the second place, that they were free from disease. But I should only adopt that system upon the clear understanding that an equally severe repressive system should be adopted in this country. It does not appear to be consistent to impose severe restrictions upon foreign animals which are brought here, and at the same time to allow the diseases which we propose to arrest to be carried freely over this country through the movement of diseased and infected animals.

313. What you represent, I suppose, is that if the object is absolutely to stamp it out, it would not avail to stamp it out with regard to the foreign importation alone, but that the same restrictions must apply generally?—That is my impression.

314. In dealing with the foreign imports, what restrictions would you place upon the conveyance of cattle from those countries, where allowed?

—First,

Professor *Brown.*

11 May 1877.

Chairman—continued.

—First, with regard solely to cattle plague, I think there is no escape from the conclusion, that as slaughter at the port of landing has failed to protect us, we must either adopt a new system of dealing with animals on arrival here, or we must totally prohibit the introduction of live animals, at any rate of live cattle, from countries where cattle plague exists, or where it is likely to be introduced. If we adopted the first system, it would be necessary to have cattle brought in ships which were exclusively devoted to that trade, and which could be detained at the place of landing until the condition of the animals had been certified by the inspector; and it would also be necessary that the persons who had come over with those cattle should be treated as the cattle are themselves, and be detained for the 12 hours, or whatever other time might be thought necessary.

315. That there should be no possibility of any communication as from those vessels with the shore?—Quite so. I believe this system would be so onerous that it would be impracticable. I do not apprehend that we should be able either to detain the ship or the animals. I do not for a moment imagine that the persons forming the crew of the vessel would submit to any such restriction. Therefore I am forced to the conviction that the only way of dealing with cattle plague is to prohibit the importation of live cattle from those countries where cattle plague has been certified to exist.

316. Or countries from which, or through which, the transit of animals is likely?—Quite so.

317. What countries would that embrace?—Germany and Belgium; the cattle from Schleswig and Holstein I think might, without risk, be allowed to come to this country for the purpose of slaughter.

318. You are of course dealing now only with the case of cattle plague?—Entirely. Immediately on learning that the cattle plague had entered Germany, even at the extreme eastern frontier, I should totally prohibit meat, hides, hoofs, and horns, and, in fact, all animal products which might be likely to convey the disease.

319. I understood you to say that, whilst prohibiting the importation of cattle from the country in a live state, if cattle plague broke out in such scheduled countries, you would then go further, and prohibit the import of those other articles, including meat?—During the time that cattle plague existed in that country I should.

320. You would include meat?—Meat, hides, horns, and hoofs, chiefly.

321. What would be the object of including the dead meat?—Chiefly from the apprehension that meat from cattle-plague animals would be sent over.

322. You think that, in fact, as soon as cattle plague broke out in a country, the object would be to kill the animals and send them over to market in this country?—Yes; and, knowing that the German Government would get rid of the disease in a very short time, I should not apprehend any very great inconvenience from the prohibition of the importation of meat during the time that the disease existed there.

323. This ought to apply, in your opinion, only to what you have described as the "scheduled" countries?—The total prohibition I should only apply to cattle from Germany and Belgium.

324. You would deal with them in the same way as the department at present deals with Russia?—Or rather, as at present we are dealing with them.

325. What I mean by my question is, that for some time the import of cattle from Russia has been entirely prohibited; therefore you would place Germany, the Netherlands, and Belgium in the same position as Russia?—I should, except that I should allow the importation of all the products of the animals.

326. Those are stopped with regard to Russia?—Yes, or they are admitted only under restrictions; I should not interfere with those trades at all, so long as the country remained free from disease.

327. And only on the breaking out of disease would you enforce the orders as regards those other articles?—Yes.

328. How would you deal with such countries as France and Schleswig-Holstein under a system such as you have suggested?—I should leave France in the schedule, and I should also keep Schleswig and Holstein in the schedule.

329. When you say that you would keep them in the schedule, do you mean that you would prohibit those countries sending live-stock here; or would you allow them to send live-stock, provided they were slaughtered at the port of debarkation?—I should allow them to send live-stock here, provided it were slaughtered at the port of debarkation.

330. As to the other countries, Spain, and Portugal, and Norway, and Sweden, and Denmark, would you place them as unscheduled and unrestricted, or would you deal with them as you propose to deal with Schleswig-Holstein and France?—I should allow them to send animals here as unscheduled animals, but on the condition that they gave satisfactory proof that their country was free from disease, and that they had made such arrangements as in all probability would keep their country free. I am speaking now solely in reference to cattle plague. I should not interfere with those countries at all on the question of cattle plague; I should let them send their animals here quite free.

331. This prohibition on the importation of live-stock would, in your opinion, give the greatest security, as I understand you, from the Continental diseases?—I believe that the total prohibition of the importation of live animals from Germany and Belgium would secure us from outbreaks of cattle plague.

332. But you would still be left exposed to the other diseases?—We should.

333. How would you deal with Holland; would you treat that as you would treat Denmark?—Yes, so far as cattle plague is concerned.

334. Because they have the same restrictions there with regard to importation?—They have.

335. Looking at the question from the other point of view: supposing those countries to be allowed to import free, what restrictions would you apply with regard to pleuro-pneumonia, which in Holland is acknowledged to be constantly existing?—There can be no question, I think, that in order to protect ourselves from pleuro-pneumonia we must schedule cattle from Holland.

336. That is to say, that Holland must on account of pleuro-pneumonia, and not on account of cattle plague, be placed in the schedule, and that, therefore, the cattle coming from that country

Chairman—continued.

try would be slaughtered at the port of debarkation?—They would. In the case of dairy-stock from Holland, if it is considered necessary to continue that importation, I should propose to insist upon animals being selected for the purpose of export to England, and I should only allow them to be shipped with a certificate of their origin, which should give certain guarantees that they had not come from a district where pleuro-pneumonia existed. On their arrival in this country they should be branded, sold only at a market which is not a market for fat stock, and kept under observation on the premises of the purchaser for at least three months.

337. And in that way you think that you might safely introduce for dairy purposes cows from Holland?—I think so; at any rate we should obtain the earliest information of an outbreak of pleuro-pneumonia, and we should be able to deal with it. But I may say that I make this proposition, having in my mind at the same time the scheme which I should propose for dealing with animals in this country, so that the two things will have to be read together.

338. On the ground, as you stated before, that you think that if steps are taken for eradicating pleuro-pneumonia by violent restrictions as against the importing trade, you should carry them out equally with regard to your home trade?—Quite so. If the object is to eradicate those diseases, and not merely to prohibit importation from abroad, then I contend that, in addition to severe restrictions upon foreign imports, we must adopt severe measures in our own country. In any case I should propose to prevent the future introduction of cattle plague, whether restrictions are applied in this country or not; but I should stop there, unless it is clearly understood that repressive measures are to be employed here for the purpose of eradicating pleuro-pneumonia and foot-and-mouth disease.

339. Do you believe that such restrictive measures as you think would be absolutely necessary would be tolerated in this country?—My impression is that they would not.

340. Then that breaks down at once the restrictive suggestions with regard to the dealing with foreign pleuro-pneumonia?—Quite so; it seems to me a useless proceeding to hamper the foreign trade and certainly to diminish the supply of animals to this country with the ostensible object of getting rid of certain diseases, unless you prove the honesty of your intentions by setting to work to get rid of those diseases at the same time; and I think that it is generally admitted that the only way to get rid of pleuro-pneumonia and foot-and-mouth disease in this country is to adopt restrictions of the most severe character; it is quite a matter of certainty that so long as we permit free trade and free movement of animals all over the kingdom, so long we must continue to have outbreaks of these affections.

341. And, therefore, really the scheme which you have suggested is limited to dealing with cattle plague, from your belief that those restrictions which you think are absolutely necessary for the whole country, if adopted at all for any part of the trade, would not be tolerated either here or in Ireland?—That is my impression from what I have seen and heard all over the kingdom. But it is fair to state that the allegations are to the contrary; I believe it is publicly asserted that if proper restrictions were

Chairman—continued.

put upon foreign importation the stockowners of this country are prepared to submit to any restrictions, however severe, for the purpose of getting rid of these diseases.

342. That is restricting movement and enforcing such regulations as you have suggested are in force on the Continent for the purpose?—Quite so. The statement which is made in public amounts to the mere general one that restrictions will be cheerfully submitted to. The difficulty to my mind will arise when it is known exactly what those restrictions will amount to. I can quite understand the stockowners of the country professing their readiness to do everything that is necessary so long as they have not the slightest conception of what the "necessary" is; but I very much fear that as soon as they know what is suggested, with one voice they would say, "This is a thing we cannot submit to."

343. And that makes you think that your recommendation should really be limited to dealing with the cattle plague, and not with pleuro-pneumonia?—That is quite my view of the matter.

344. I suppose you would base your ideas of dealing with the cattle plague in the way you have described upon the great danger that has been shown of its introduction into this country, in consequence of the difficulty of ascertaining what takes place with regard to it in the foreign district in which it is bred?—Quite so, and I think we have good ground for believing that the risk will increase every year. The facilities of transit are constantly increasing, and when it is known that animals may be moved from an infected district, and taken from one end of the German Empire to the other, before the disease is discovered, I think we have clear reason to apprehend that no international regulation can possibly protect us, and that nothing short of total prohibition of the importation of live cattle from those districts will be of the slightest use.

345. Evidence was given before the former Committee that the supplies were being drawn further from the south of Europe; I suppose that since that date we have even less reliable knowledge of the sources of our supply than we had then?—I certainly believe so.

346. I suppose your reason for allowing hides, hoofs, horns, bones, and other articles, to come in from what you have described as future scheduled countries, or prohibited countries, is, that it would most essentially interfere with a great many important industries if they were prohibited?—There is no doubt of it. We have been informed that even the temporary prohibition has led to a great deal of difficulty, and it seems that we have interfered very much with a large trade from South Africa. It appears that it is the custom to bring horns, and other animal products, from those countries, and land them in Hamburg or Belgium, and then by other vessels to bring them to this country, and we are informed that the system cannot be modified, and that they cannot be brought from the point of origin direct to this country, and that our prohibition amounts to a total stoppage of that trade.

347. And you believe that that relaxation with regard to those industries will not, to any material extent, prejudice the safety that you expect to derive from your prohibition of the

Professor *Brown.*

11 May 1877.

Chairman—continued.

importation of cattle?—No, I apprehend not to any appreciable extent.

348. Has your attention been at all called to what has been very much mentioned lately, and that is the American dead meat trade, which is supposed to have been created?—I have had my attention called to it merely as one of the public. I have not made any investigation in reference to the amount of the supply, or to the probability of its continuance.

349. Have you considered it, looking at it from a scientific point of view?—From a scientific point of view, I have no doubt that the importation of meat is quite feasible.

350. Do you include in the importation of meat the importation of offal as well?—Yes, I have no doubt that the present resources of science are equal to the preservation of meat and perishable articles of all kinds for practically an indefinite period. It is simply a question of cost. I have no doubt that that meat and offal can be brought from any part to this country in perfectly good condition.

351. Do you mean in all seasons of the year, in summer as well as in winter?—I have no doubt whatever that they can be so brought in all seasons of the year.

352. Supposing that they are brought, do you believe scientifically that they will arrive here in hot weather in such a condition as to be as available as meat in the market as if they were slaughtered here in the morning of the day?—I believe the difficulty will arise when the products arrive in this country in the very hottest weather, because I could not possibly conceive that meat brought here under any system whatever could be in better condition than meat which is killed at the moment of the arrival of the vessel. The difficulty which suggests itself to me is this: In both cases the meat which is killed at a given moment and prepared for sale, and the meat which arrives here from abroad will probably not keep more than 12 hours in very hot weather. Butchers are constantly compelled to kill their beef and mutton in the cool of the night, in order to supply their customers on the following day; and if they are induced to keep a leg of mutton for two days, I happen to know, as a matter of fact, that that mutton is commonly uneatable. Assuming that the meat which arrives here is just as good as the meat which is killed at the same moment under the most favourable circumstances, it appears to me that it would be almost impossible to distribute it to any extent without very materially interfering with its condition.

353. You mean that the difficulty of its transit through the country would make it impossible that you should get it fresh?—Unless it can be moved in the same apparatus in which it was brought to a landing-place.

354. I suppose a system might be set up which would enable you to carry the dead meat through in the same temperature to the market where it was to be sold, whether that was at the port of landing or in the centre of the country?—Undoubtedly. Then on arriving at the centre where it is to be consumed, you have still the difficulty of distribution, because you must consign to that town a certain quantity, and unless previous arrangements have been made for its immediate distribution, it must be bought by retail butchers, and must be conveyed by them in some way to their shops, and must be kept there until it is

Chairman—continued.

sold, and subsequently sent out to the customers.

355. That system is at present in existence in New York, I believe, and in this town itself a dead meat market exists?—Yes, but I am not aware if it has ever been tested in the very hottest weather.

356. Do you mean that the Smithfield Market has not been successful in the hot summer weather?—I thought you meant with reference to the imported meat.

357. I was referring to the possibility of a central depôt, such as the Smithfield Market, being created, into which the American meat could come, and where the retail trade could avail themselves of it?—I am not quite certain upon this point, but I believe that the supply in the very hottest weather is considerably diminished, on account of the difficulty of conveying the meat to distances in such a state that it will be fit for food when it arrives.

358. In very hot weather the mere carrying of it from the market to the shop from which it has to be sent out to the customers is prejudicial? Undoubtedly so, and we have this fact before us, that tons of meat are condemned in the hot weather as unfit for food.

359. I suppose that there is this to be said on the side of the imported dead meat trade, that in hot weather the animal is prepared for slaughter in a better way than he probably is after being driven as is the case in this country for some hours before he is killed?—I think it would amount to very much the same thing, because if there were on the other side of the water a slaughtering depôt, a larger number of animals would be driven up there just in time to be slaughtered as they are here.

360. You imagine that the same results would arise?—Yes, I should think as nearly as possible. It is always a point with the butchers in this country to keep the animals 12 or 24 hours before they kill them, knowing that under such conditions the meat will keep longer.

361. You have stated that from a scientific point of view you believe that the meat can be brought to this country; supposing it to be possible, have you considered the question of how the additional cost of the preparation of this meat affects the matter?—As far as I can see, the cost of the preparation of the meat on the other side of the water, of the proper refrigerating apparatus, and of all the conditions which are necessary to ensure safe transit, must be considerable.

362. Of course you are not now speaking of the American trade, but of the possibility of a dead meat trade from the scheduled countries whence you propose to stop the importation of live animals?—Chiefly in reference to European countries.

363. There the price of the animal ranges higher than it does in America, does it not?—Undoubtedly; it approaches somewhere near the wholesale price of meat in this country. In the American towns, I gather from a return which has just been printed, that the average price will not be very much above half the average price in this country.

364. It is about 4½*d.* as an average in New York?—That would be less than the half of the average wholesale price in this country; and that, of course, allows a very large margin for the cost

Chairman—continued.

cost of preparation, because I believe it is asserted that the meat from America must be sold at something like an average of 7½*d.* to 8*d.* per pound, otherwise the trade will not pay.

365. What you represent then is, that with the prices at present ranging on the Continent, that condition of things which exists in America could not take place?—Apparently it is impossible; because on the Continent they have outlets for their meat. Germany, it is quite well known, only sends us about the number of animals that she imports; and it will be a question, of course, with Germany how much of that number she will send to England as dead meat, and how much she will send to Paris, and other continental markets, as live meat.

366. I suppose the same state of things exists now that existed, if I remember rightly, at the time of the examination before the last Committee, in which it was shown that truck-loads of cattle sent to market from abroad came as far, I think, as Mayence, and waited there for a telegraphic communication as to the prices in Paris and London before deciding to which market they should be sent?—That system still continues. The importers are commonly concerned pecuniarily in the arrangement; some of them are part owners, or at any rate partly responsible for the animals which are to be sent, and they decide themselves on one market day how many they will have over on the next.

367. And therefore if the cost of creating fresh abattoirs abroad for the dead meat trade be added to the cost of carriage under this new system of refrigerators, the combined cost would make the expense of sending to England so much heavier, that practically the meat would all go to Berlin or to Paris?—I should say that, practically, as much would go to the continental markets as could be sold at a remunerative rate, and it would only be in case those markets were glutted that the surplus would be sent to England, and then only on the understanding that they would get more here than they would get from the lowest state of the markets abroad.

368. Practically, it would re-act in that way, and in time we should get a return of the trade from the prices falling in the other continental towns?—I have no doubt that as soon as it was ascertained that meat could be sent over here at such a price as to pay the producer a good percentage, it would be sent.

369. But this would only apply, I imagine, to a sudden stoppage of the trade; a gradual development of a dead meat trade would obviate that, would it not?—It would; but the difficulty still remains as to the establishment of the necessary machinery; for example, in a district like Schleswig and Holstein, from which we receive a large quantity of cattle during the summer season, the animals have been fed on the marshes; the owners, as a rule, are small proprietors; they send to the consignee at the shipping place twos and threes, sometimes as many as six, and sometimes 20 or 30; but it may happen that in any one cargo there may be represented a dozen owners, or even more. The difficulty which presents itself to my mind is this: who is to arrange that the consignee at the landing-place shall be represented by a slaughterman? Who is to arrange that abattoirs shall be built, and all the necessary apparatus provided, so that these threes, and sixes, and twelves, and twenties, of

Chairman—continued.

cattle coming from all parts of the Schleswig and Holstein district shall, instead of being driven into the ship, be driven into the slaughterhouse? The men themselves, the producers of the cattle, are simply powerless in the matter; all that they can do is to get their stock ready for market, and send their animals two or three at a time to the man who is in the habit of receiving them.

370. Therefore, with regard to those countries, and for these reasons, you think that a dead meat market on the other side would not be feasible?—I cannot understand how it could be arranged, unless some persons see an opportunity of making a sufficient per-centage on their capital to induce them to start a company, and to make the necessary arrangements.

371. But under the proposal that you have made for stopping the import from scheduled countries of the whole of the German and Belgium import, do you contemplate a dead meat trade being set up there?—I think a certain proportion of the animals which we should otherwise get would be sent, just as we get now a certain quantity of dead meat from Germany and from all other ports, even when there is a live trade.

372. I suppose the freight for dead meat is less than for live stock, is it not?—Considerably.

373. That would be a saving?—That would be a saving, but that would not account for the origin of the machinery by means of which the dead meat is to be conveyed. It is the initial difficulty which I see. If the ships were already prepared to receive the meat, and the abattoirs were built on the landing-place at Tonning, or at Hamburg, for the purpose of slaughtering animals there, I can understand that the owners of cattle might send them to the abattoirs instead of sending them on board ship; but until some arrangements are made by somebody, certainly not by the owners themselves, who would not have even any idea how to set about it, I fail to see how a trade could be even commenced.

374. That applies to Schleswig-Holstein?—Yes, that applies to Schleswig and Holstein, and to all other parts of Europe.

375. But under those circumstances you practically will stop the importation of meat altogether from the German source?—I expect that we should get a very small amount of dead meat sent from Germany as compared with the quantity of meat which is represented by the live cattle.

376. On that point can you state to the Committee the number on which we rely that come from that source?—From Germany during 1876 we had 69,988 cattle.

377. Those were all fat cattle sent over here for slaughter, were they not?—Yes; I do not believe that such a thing as German store stock is known.

378. Then, practically, you represent that that would be the loss of stock for the immediate supply that would take place in case the import was dealt with as you suggest?—I believe that we should get so much of it as could be sent to this country, so as to command a higher price than it would fetch as live meat abroad.

379. Then you think that that raises a difficulty as regards the supply of the metropolis?—Considering that something like 45 per cent. of the whole foreign supply comes into the Metropolitan Market, I imagine that it would raise a considerable difficulty.

380. Then we come to another objection or

Professor *Brown.*

11 May 1877.

Chairman—continued.

difficulty to the scheme which you have suggested as the only means, or the best alternative that you can suggest, for the prevention of the introduction of cattle plague?—Yes; but I should feel compelled to face that difficulty, in consideration of the advantage that we should get in the security from these outbreaks which are so annoying and disastrous.

381. In that case, do you propose dealing with sheep and swine from that country in the same way, or would you allow them to come in?—Speaking solely in reference to cattle plague, I should allow them to come in as under the present system, for the reasen that we have not had any outbreak in this country traceable to either sheep or swine.

382. Do you think that they should be slaughtered?—No. They should be detained at the place of landing for 12 hours, and then allowed to circulate over the country. I am speaking solely in reference to cattle plague.

383. That has been the practice as to Russia, from whence you prohibit entirely the importation of cattle?—We do not allow Russian sheep

Chairman—continued.

to be landed except for slaughter, and then they must come in vessels by themselves.

384. Do you propose that the existing state of things, with regard to sheep and swine, should continue until the cattle plague was announced as having broken out in one of those countries, but that the importation of cattle themselves should be entirely forbidden?—That is my proposition; my ground being that I see no way of preventing the introduction of cattle plague so long as live cattle are allowed to come from Germany. The alternative to slaughtering on this side of the water is naturally slaughtering on the other side of the water.

385. Therefore, really, the total loss that you would have to face is about from 50,000 to 60,000 head of cattle, which loss wou be diminished, to a certain extent, by any dead meat trade that might be created in its stead?—I believe so, and I am under the impression that no arrangement for a dead meat trade would be made in Germany, in consequence of the general impression which would exist there that such restrictions as we impose could only exist for a time; there would be perpetual efforts to get those restrictions removed.

Tuesday, 15th May 1877.

MEMBERS PRESENT:

Major Allen.	Mr. French.
Mr. Anderson.	Sir George Jenkinson.
Mr. Assheton.	Colonel Kingscote.
Mr. Jacob Bright.	Sir Rainald Knightley.
Mr. Cameron of Lochiel.	Mr. Norwood.
Mr. Chaplin.	Mr. Pease.
Mr. James Corry.	Mr. Arthur Peel.
Mr. Wilbraham Egerton.	Mr. Ritchie.
Mr. Elliot.	Sir Henry Selwin-Ibbetson.
Mr. W. E. Forster.	Mr. Torr.

SIR HENRY SELWIN-IBBETSON, BART., IN THE CHAIR.

The Count C. F. DANNESKIOLD-SAMSOE, called in; and Examined.

Chairman.

386. YOU are prepared, I believe, to give evidence before this Committee with regard to the question of the cattle in Denmark?—Yes.

387. Do you come over to this country representing the Agricultural Society of Denmark?—I do.

388. Could you tell this Committee whether cattle plague has existed in Denmark during recent years?—Not since the year 1772, but in the Duchy of Holstein it existed in 1813 and 1814.

389. Was that the last outbreak of cattle plague in your country?—That was the last outbreak.

390. Since that you have never had, in any part of Denmark, a return of the disease?—No.

391. Have you had any visitations of pleuro-pneumonia in Denmark?—Yes, in 1848, and in 1861. On both occasions the epizootic was confined to one single farm; the animals were immediately slaughtered, and the farm placed under strict quarantine.

392. On both those occasions, did that disease spread in the country?—No, it was localised to the farm where the outbreak first occurred.

393. It was absolutely localised to the farm where it originated, and the precautions which were taken were sufficient to prevent its spreading?—Yes.

394. With regard to the other complaint, foot-and-mouth disease, have you had any experience of that in Denmark?—Certainly, several times. In 1841 to 1842 the disease appeared in Jutland and some of the islands. In 1859 some sporadic cases occurred in the Island of Funen only. The disease appeared in Copenhagen in 1862, and some sporadic cases occurred in different parts of the country. Then, from August 1869 until March 1871, the disease was spread over the greater part of the country. Since then some sporadic cases have occurred; in 1872, altogether 19 cases occurred on four farms, of which in the aggregate the whole stock consisted of 60 heads; in 1873, there were four animals affected on one farm, the stock consisting of 80 head; in 1874, there were eight animals affected out of 40 on two farms; in 1875, there were 130 animals affected out of 147 on 13 farms; in 1876, there was one case on one farm, but in what number of stock I do not know.

Chairman—continued.

395. And that was the only case, that you are aware of, as existing in your country in 1876?—Yes.

396. Then we may gather from that, that the precautions taken to stamp out the foot-and-mouth disease were in each of these years effectual?—Yes. Before 1875, the foot-and-mouth disease came under the less severe rules as to diseases; but, since 1875, it has been put under the same class of severe rules as pleuro-pneumonia and cattle plague, &c.

397. In consequence of there having been a larger outbreak, as shown by the number of animals attacked in 1875, your Government placed the foot-and-mouth disease in the same category as pleuro-pneumonia?—Exactly.

398. And the effectual result of that is shown in the Return for 1876?—Exactly. The foot-and-mouth disease was in 1875 rather dangerous in some other countries, so our Government thought it right to carry through as severe a law as possible.

399. Being anxious to maintain your character for exemption from disease, you made your law more strict on the complaint breaking out in foreign countries?—Yes.

400. Can you give the Committee a history of the laws and measures which you have adopted in Denmark concerning these diseases?—Yes; I have had the most essential laws and rules translated for the Committee, and I beg to hand them in. (*The same were delivered in,* see *Appendix.*) I should like to call the attention of the Committee to the fact that sheep-pox and sheep-scab, &c., have always been subject to similar laws and rules as pleuro-pneumonia. That will be seen from the first-named law, that of 29th December 1857; and, since 1875, the foot-and-mouth disease has been

Count *Danneskiold-Samsoe.*

15 May 1877.

Count *Danneskiold Samsoe.*

15 May 1877.

Chairman—continued.

been included under the more severe provisions of that law. This law of 29th December 1857 forms the basis of our legislation on the subject of infectious diseases in domestic animals.

401. That Order relates to the laws and regulations with regard to your home stock?—Yes. Besides this, there are general instructions for the treatment of infectious cases in domestic animals, and also special instructions concerning the foot-and-mouth disease and the pleuro-pneumonia.

402. All the regulations, of course, relate to any outbreak taking place in your country?—They do. Then we have also laws to prevent the plague, or any disease, from coming into the country, and laws and rules to prevent any disease from going out of our country. I have also here the most essential rules translated; as, for instance, "Order concerning measures against importation of cattle plague from Germany." Then there is a law concerning the export of domestic animals from Denmark.

403. Can you give the Committee an idea of the regulation or law which prevents the import across your frontier of foreign cattle?—Yes; that is the Order concerning measures against the importation of cattle plague from Germany, of 16th January 1877. It is as follows: "Inasmuch as the cattle plague has appeared in Germany, the Home Office has decided, in virtue of the Infectious Diseases of Domestic Animals Act of 29th December 1857, Article 9, to order the following measures in order to prevent this disease being brought into the country, viz.: Article 1. Importation into this country from Germany of horned cattle, sheep, goats, or undressed parts of these animals, such as hides or skins, whether dried or salted, horns, hoofs, wool, hair, meat not smoked, tallow not melted, &c., is prohibited. No cattle truck, foreign or Danish at this moment being abroad, may be brought across the frontier of Jutland."

404. Do you mean by that that you do not allow any truck which has carried cattle across the frontier to return into Denmark?—No, not even our own may return.

405. They are absolutely prohibited from coming back?—Yes; "All other domestic animals than those above mentioned on arriving from Germany must be disinfected before being imported."

406. That relates to horses and poultry, I suppose?—Yes, and such things.

407. Do you restrict at all the importation of fodder, or straw, or *emballage* of any sort?—Certainly; the article proceeds as follows: "Likewise all hay and straw from Germany is to be disinfected before importation, unless it serves as packing, properly speaking, for goods which are not themselves likely to carry infection, being placed in baskets, barrels, or boxes, in which the goods are transported, or tied round the merchandise, in which case the hay or straw may be unloaded and delivered to the importer without previous disinfection, on the condition that the latter immediately after reception of the goods causes them to be unpacked, and the packing to be disinfected or burnt under the supervision of the veterinary police." It is always burnt when it is infected.

408. You go so far as to deal even with the straw or hay that forms part of the package of goods?—Exactly.

Chairman—continued.

409. And you force them, if coming from one of those countries, to be disinfected?—Exactly.

410. And you would represent that those regulations, as against Germany and the Continent, have been entirely effective in preventing the introduction of disease into your country?—I think I can say so, because we have had none.

411. Have you any regulations of the same nature as against the import of cattle from other countries, such as Sweden?—The Government has permission to forbid the import as soon as there is any serious disease in any other country. That is the law, and it has been carried through several times against Germany, and against Great Britain, when there has been any serious disease here; in Sweden also there has been sheep pox during two years, and we were not allowed to import from Sweden.

412. On the outbreak of any of these other diseases, besides cattle plague, you stop the import from any country where it has broken out?—Yes; and from Russia all importation of animals has been totally stopped since 1869.

413. Does that include, besides animals, the importation of hides, hoofs and things of that sort, from Russia, or are they admitted?—No, they are not admitted. The Order applied to Prussia in 1869 is in all essential points identical with the one above mentioned of 16th January 1877.

414. These being your laws against importation, what are your regulations for the stamping out of disease, supposing that it should arise in the country?—We have, for instance, a regulation to be observed with regard to pleuro-pneumonia which is among those which I have put in.

415. You represent that these internal regulations for dealing with the disease of pleuro-pneumonia have, as you state to the Committee, been effectual in stamping it out at once on its introduction into the country?—We think that it must be the case, as we have had pleuro-pneumonia twice, and both times we have localised it to the farm where it had its outbreak; and we believe that that is on account of the good law that we have got.

416. I believe that you have also certain strict regulations with regard to the export of cattle from your country?—Yes. This is a law concerning the export of domestic animals from Denmark, dated 25th February 1876: "The Government is authorised to take such measures as may be found necessary, in order to prevent that domestic animals are exported from this country which are, or may be suspected, to be affected with contagious diseases; and also to prevent that the animals sent to foreign countries from Denmark are exposed to such diseases in their journey to their destination." Then there is an Order of the 26th February 1876: "In pursuance of the authorisation granted to the Government by the law of the 25th of this month, concerning measures with regard to the exportation of domestic animals from Denmark, the following provisions are hereby ordered in respect of export of domestic animals to Great Britain."

417. Will you state to the Committee what are the principal regulations by which you deal with cattle which are on the point of being exported; are they allowed to be embarked without any restriction?—Certainly not. "Every head of cattle which is intended for shipment to Great Britain must, before it is brought on board, be examined

Chairman—continued.

examined at the expense of the sender by a veterinary surgeon authorised for the purpose by the local prefect of police, and must not be shipped unless it is proved by examination not to exhibit any symptom of any infectious disease; and unless there is no other reason for suspecting it of being infected with any such disease, to which effect a certificate is to be given by the veterinary surgeon."

418. Do you allow the cattle when they come down to the port of embarkation to mix together, or do you keep the different herds brought from different districts separate before they are examined?—"At the examination of the animals the different droves are to be kept separate in such a manner as to prevent an infectious disease, which might possibly exist in one of them from being transferred to the others."

419. So that, as well as your regulations with regard to the import into your country, you have very strict regulations regarding the export trade out of it?—Yes.

420. Those regulations, as far as the returns are concerned, have been very fairly successful, have they not?—Yes, I think so.

421. There has not been any importation of disease from the country during the last few years, with the exception of one reported case of foot-and-mouth disease?—No.

422. And that took place in 1875, did it not?—In 1875, I think, according to the Blue Book that I have seen, the Annual Report to the Privy Council.

423. Was that the time when you had the foot-and-mouth disease in Denmark?—It was; and that was just at the time when the Government adopted these severe regulations putting it into the same class as pleuro-pneumonia.

424. At that time did your vessels that carried cargo touch at any other ports on their journey?—It is very seldom that they touch at any other ports; they generally go direct.

425. But there was no Order at that time preventing them from touching anywhere?—No, I do not think there was.

426. Has there been an Order of that sort passed subsequently?—I think there has not been a regular law to prevent them. The Government has pointed out to the shipowners how important it is to them to be very careful about this question; but I do not think there is any law about it.

427. Can you tell the Committee what the numbers are as to export from the country?—I have made a list of our exports from 1866 to 1876, which I beg to hand in. (*The same was delivered in.*) That shows that from 1866 to 1870 our export to Great Britain was about the same: it was 8,900 cattle in 1866, 6,100 in 1867, 4,500 in 1868, 6,100 in 1869, and then 8,500 in 1870; but since 1870 to 1876 it has very much increased, because in 1876 it was 57,900 as the total export of cattle to Great Britain.

428. And the number of sheep was 58,200?—58,200, as against 5,300 in 1870.

429. Would you kindly give the intermediate years between 1870 and 1876, showing the rise of the exports of cattle during those years?—In 1870, there were 8,500; in 1871, there were 13,400; in 1872, there were 19,000; in 1873, there were 26,300; in 1874, there were 26,300; in 1875, there were 50,200; and, in 1876, there were 57,900.

Chairman—continued.

430. So that it has been a steadily progressing trade in the last few years?—Yes. The export of sheep in 1870 was 5,300; in 1871, it was 9,800; in 1872, it was 14,000; in 1873, it was 20,000; in 1874, it was 13,700; and then it rose to 55,200 in 1875; and then, again, to 58,200 in 1876.

431. Can you tell the Committee what were the ports to which these cattle were principally exported from Denmark?—Especially Newcastle-upon-Tyne, London, Thames Haven, and Leith. In 1876, the number sent to Newcastle was 33,920; to London it was nearly 16,000; and to Leith it was 7,800; then comes Hull with only 330.

432. Your exportations to Leith in 1876 being nearly 8,000, to London 16,000, and to Newcastle-on-Tyne 33,920, were those about the proportions in 1874?—I am sorry to say that I have not taken out the figures as to 1874, but those will be found in the Annual Report to the Privy Council.

433. Are you aware that at that time the export from Denmark to London, for instance, as compared with these other ports was very small, and that to London, in 1874, there were only 3,173 head of cattle imported as against 15,000 to Newcastle; whereas the export to London has now risen in 1876 to 16,000, as you have stated, showing a great increase in the export from your country to this particular market?—Yes.

434. Can you give the export to other countries from Denmark?—Yes; our export to other countries is only to the Duchies of Schleswig and Holstein, and that is an export for the most part of lean cattle which are fattened on grass in the Duchies.

435. Are they sent down to the pastures of Schleswig-Holstein?—Yes. I put this just to show that the export to the Duchies is the same now as it was in 1866; it is only to England that the export has increased. In 1866, there were 45,900, and it has varied down to about 35,400; and in 1875, it was again 45,400.

436. So that the export trade to Schleswig and Holstein has been steady, whilst the export to Great Britain has almost bounded up?—It has bounded up; it has increased nearly sevenfold within the last six years. To other countries there is scarcely any export, because these two numbers make 95,000, and our total export is 97,000, and that only leaves 2,000 to all other countries.

437. Have you the same restrictions and regulations with regard to cattle going out of your country into Schleswig, that you have with regard to cattle leaving your country for Great Britain?—Not unless there is any disease in our country, and then the Germans, of course, would require it.

438. You do not take the same precautions on the frontier that you take on the seaboard, that is to say, you do not have the cattle inspected before they leave the country, the herds being kept separate?—No, I do not think so.

439. But you represent that your regulations with reference to the import of cattle and other articles into your country render it most improbable that disease should originate in your country, and that, should it originate, you take every precaution with regard to the export to protect this country?—Certainly we do.

440. Is there any other point that you would wish to put before the Committee?—I do not know

Count *Danneskiold-Samsoe.*

15 May 1877.

Chairman—continued.

know that there is any other point that I should wish specially to remark upon.

441. Has this trade which has sprung up with Great Britain at all altered the history of your home farming; have the Danish farmers gradually brought themselves to alter their system of farming, so as to meet the increased export that was coming upon them?—To a certain extent, no doubt, because in former days there was very little export, and most of the farmers were dairy farmers; since 1870 and 1871, we have had a very good market here in England, and then, of course, agriculturists took to breeding and fattening for export, and these numbers show that the farmers have taken very much to that in these later years, because it was evident that it paid pretty well; and, of course, we should be very sorry to lose this good export trade to Great Britain.

442. It would alter the whole system on which you have begun the rearing of cattle?—If it should be prohibited to send live cattle to England, I think I may say that we should have so much difficulty to overcome that probably the farmers would soon go over to the dairy system again, because of the obstacles that would be in their way.

443. Do you think that there would be any possibility of establishing a dead-meat trade as from your country to this country?—I do not think so; we should have many difficulties to get over. For instance, nearly two-thirds of the cattle that we send over here, we send between the months of April and September, that is in the warmer season; and our country is not a regular ice country; we cannot be sure of ice; we can be sure of ice perhaps every third or fourth or fifth year, but there are several years when we have no ice, and then we should have to buy ice from Sweden and Norway, and that would, of course, be very difficult.

444. You mean that it will increase the expense so much that you would not be able to compete in the market here as a dead-meat trade, looking at the price of your cattle at home, if you added to it these additional expenses?—No, because the farmers' taxes and rents are so high that they would have no profit when they sold their dead meat in the harbour, there would be no margin to pay for the transport and other charges.

445. There would be no margin for the extra expenses which would be thrown on the country in creating a dead-meat trade?—Exactly.

446. Can you give the Committee the price per pound of your cattle in the country?—It is very difficult to put any certain price, because a very great proportion of what we sell are lean cattle, and a great part, again, are half fed, and then there are fat cattle; and that, of course, varies the price immensely.

447. What you represent is, that the price of the cattle is in excess of the price of the American trade, and that therefore you could not, as the American trade seems to be able to do, compete in the market after the additional cost had been thrown upon you?—Certainly not, because the pasture in America is so excellent for fattening, it is much better than ours; and the rents in America, and the taxes on the properties, are so much lower than ours that of course they can produce the meat much cheaper than we can. Our taxes are nearly as high as they are in England.

Mr. *Arthur Peel.*

448. When vessels bring cattle from Denmark to this country, are the vessels, on their return, disinfected, or is any precaution taken to secure that the plague is not brought back from Great Britain to Denmark?—It is always the case that as soon as they come back from England they are inspected by a veterinary surgeon, and they are disinfected.

449. Can you state what is the proportion of store and fat stock which is exported from Denmark to Great Britain?—According to our statistics not half of them are fat stock.

450. Do I correctly understand you to say that you import no cattle into Denmark?—We import some cattle; we import between 10,000 and 14,000.

451. Where do they come from?—Chiefly from Sweden; the rest come from England, for breeding purposes, bulls, and so on.

452. But you import none from Germany and Russia, under any circumstances?—From Russia, since 1869, the import has been completely prohibited, and we import very little from Germany.

Colonel *Kingscote.*

453. Before all this export trade with England sprung up, was it not the case that you often killed your calves?—We killed our calves generally.

454. Merely because you could make a better trade in butter than by breeding meat?—Exactly, we would not give them the milk because we preferred to use the milk for butter and cheese. We usually killed them, and we have been often blamed by Englishmen who visited our farms. Now we seldom kill them, because we breed and fatten; we kill them much less, at any rate.

Mr. *Anderson.*

455. Since you prohibited the import from Russia have you had any rinderpest?—We have not had rinderpest since 1772; not in this century.

456. But you had it in the last century?—We had a very grave disease, and we suppose it to have been rinderpest; but we cannot tell whether it was the same cattle plague that you call rinderpest now.

457. Did you prohibit your importation from Russia in the fear of rinderpest coming from there?—Exactly.

Mr. *Elliot.*

458. If you sent dead meat from Denmark instead of lean cattle, would not that pay the farmer?—No; it is impossible to kill the lean cattle with profit.

459. But they would grow fat instead of remaining lean, would they not?—It is a great question whether we should be able to do that.

460. Your pasturage is good enough, is it not?—No, our pasturage is not good; but we fatten in the stable; there are very few places in our country where we can really fully fatten on pasture.

Mr. *Jacob Bright.*

461. Is there any special reason that you can assign for the sudden and extraordinary increase in importation into this country since 1870?—Because farmers have taken to fattening; they did not at all understand or know what fattening was in former days; and because the market was very good here in England, so that it became advantageous

Mr. *Jacob Bright*—continued.

advantageous to them to sell here. The free import that we have in England, especially as it is not allowed from several other countries, gave them a good opportunity for breeding, fattening, and exporting.

462. Is it likely that there will still be a large increase of exportation from Denmark?—Yes, I should say so, and I think that, the prices being as good here as in the Duchies, even our exports of lean cattle to the Duchies might very likely go this way if you had any want of them here.

463. Have you at all considered the possibility of introducing dead meat from Denmark instead of live cattle?—We have considered the question since March 1876. For two years we have been considering the question in our society, and at many meetings all over the country, and we have come to the conclusion that at present it would be impossible, or very difficult, because of the great risk in going into a new trade; besides, the art or secret of preserving the meat is not known to us, and I do not know if it is proved that even the Americans can go on the whole summer; and then, as I mentioned, the greater part of our import is during the summer months, when we could not be sure of having ice. Then, too, the exporters who buy in our country are not one or two great men, but it is in the hands of many, and that makes it more difficult for them to build these big buildings, to have new stables built with new slaughtering places, and new ships, and all that is required.

464. You said that the absence of ice would be a difficulty; but you do not consider that the only difficulty; you consider that there are other difficulties?—Yes; there would be many other difficulties.

465. At present your importation to this country is free; you are not a scheduled country?—No.

466. What effect would it have upon trade if your cattle were obliged to be slaughtered at the port of landing in England, instead of being allowed to come free into the country; would that have an injurious effect upon the importation?—It would, certainly. The farmers are very much afraid of that, because they do not believe that they will have a sufficient profit then so that they can go on with the trade; because that would entail a loss of several per cent.; and as their present rate of profit does not allow any more loss, I do not think that they would be able to go on.

467. When you say that you would lose so much per cent. by slaughtering at the port of landing, are you speaking from experience; do you know it to be the case?—That is what the farmers have been calculating. I, personally, do not exactly understand it; but people of experience, who have been studying the question and who have been calculating the prices, and know, for instance, what is the price received at Deptford and other places, are of that opinion.

Mr. *Assheton.*

468. I think you told the Chairman just now that the expense of a dead meat export trade, as compared with the expense of a live stock trade, would prevent the dead-meat trade from being adopted; I should like to know a little more clearly what are these extra expenses that you contemplate?—The difficulties, the obstacles, and the expenses.

Mr. *Assheton*—continued.

469. You say that a dead-meat trade would be more expensive; I want to know what those extra expenses are with a dead-meat trade, as compared with a live stock trade?—We should be obliged to have several extensive slaughtering places. Of course it must be in the hands of one or more large companies; and they would have to build stores and houses, and provide ice, and so on; and the ships must be constructed specially for that purpose, as far as I know. Of course that would augment the expenses of the export, as far as we can understand.

470. To what ports do you send cattle now?—We send them to Newcastle and to Leith, London, and Hull.

471. How long are the cattle in transit from Denmark to those ports?—It depends upon where they leave the country. We have 10 ships that go continually with cattle all the year round, and from six or seven different harbours. When they go from Copenhagen they take about three days and three nights on an average. When they go from Esbjerg a new harbour which we have built on the west coast of Jutland, they only take 36 hours to go down to Thames Haven; that is half the time.

472. Do you provide the cattle with food and water on board?—Yes.

473. In estimating the expenses of the two trades, has it never occurred to you that a live bullock with its food and water occupies considerably more space on board ship than the dead carcase of a bullock would occupy?—Yes, I dare say it would.

474. Do you not think that that would be an element which would make the dead-meat trade less expensive than the live stock trade?—Of course that is also a question which we have been considering in our country, but we do not think that that would make all the difference. For instance, all the offal would then not be sent, and it would fetch a very small price in our country; because where the harbours are and where the slaughtering place would be, there is a very small poor population who would buy it. We should have the greatest loss in selling it in our country. Esbjerg, for instance, from which the greatest export would take place, is on the west coast of Jutland, in a very thinly-populated part of the country; I think that would be a great loss.

475. Of course it is a balance of difficulties; I understand you to say that one difficulty in a dead-meat trade would be that you would have to provide slaughtering places, and that another difficulty would be that your offal in Denmark would not be worth so much as it would be in England?—No, certainly not, and another difficulty is that we have no reliable supply of cheap ice; I think that is also a question of great importance, especially as regards the transport in the summer months.

476. Now I want you to consider whether there would not be advantages on the other hand. I think you say that you provide food and water for the cattle in transit; that expense would be saved if you killed them on the other side, would it not?—Certainly.

477. Then, again, you say that the live bullock with its food and water occupies considerably more space on board ship than the dead carcase would?—No doubt.

478. Considering these advantages on each side

Mr. *Assheton*—continued.

side, do you still adhere to your belief that a dead meat-trade would be more expensive than a live stock trade?—Decidedly; because it is not my personal opinion that I express, but it is the opinion of farmers in our country, after having considered this question with both its advantages and disadvantages during a couple of years. Of course I can only express what the farmers at present believe; they do not know this new trade, and that is their opinion about it. In the course of some years, when it is known more fully, I cannot say that it is impossible that that trade should ever take place; I can only express the opinion of the farmers in the country at present, and I believe, according to that feeling, a great number of them would take to the dairy system, because the difficulties would be considerably less in changing to the dairy from the fattening system; it does not require so much outlay of money.

Mr. *W. E. Forster.*

479. You export about 45,000 cattle to Schleswig-Holstein, I think?—Yes.

480. Are they for consumption in Schleswig-Holstein?—No, they are for fattening on their pastures.

481. And then, I suppose, they are exported from there to the German market?—I do not know; the Duchies do not belong to Denmark; I think that the great export goes from Töning to Great Britain; so far as I know, that is one of the places from which they send a great deal over to England.

482. That quite confirms my knowledge of the subject; that some of your cattle come direct, and some go through Schleswig, being fattened there?—Exactly; I think that most of them go to England.

483. How old are the cattle that you sent to Schleswig generally when you send them?—They are generally three or four years old.

484. Supposing that you were prevented from sending your cattle to England, do you think you would send more to Schleswig?—I do not think so, because during these last 11 years they have always bought the same quantity, that is as much as they want to fill their pastures.

485. Have you ever seen any Danish cattle sold for the Paris market, or for the French market?—I do not think so. For instance, in 1866, the export was altogether from our country, 45,900 to Schleswig and Holstein, and 8,900 to Great Britain, the total export being 55,800. Every year there are between 1,000 and 2,000 sent to other countries.

486. Are these figures that you give us what you have obtained from Denmark?—These figures which I give you are the statistics from Denmark, and answer exactly to the same which you receive here in the Annual Report to the Privy Council. I have received them from Denmark from the Agricultural Society.

487. I merely ask that question, because it is a pleasure to find that the statistics from the two different sources, from our office, and from your side, agree?—It is from our offices at home that I state all these figures; only for the last year, 1876, we have not yet made it up completely at home, and that I have taken out of the English Report.

488. I think you stated, in answer to the honourable Member for Manchester, that you thought it would be a decided loss if your cattle were obliged to be slaughtered at the port of landing?—I think so.

Mr. *W. E. Forster*—continued.

489. Do you at all know whether it would be considered to be a loss that these cattle coming to London should be slaughtered at the foreign market at Deptford, rather than that they should go on to the general market in London?—I do not think I can answer that question.

490. With regard to your export of cattle to England, the ships are specially fitted up for the cattle trade, are they not?—They are. There have been several ships built for the purpose of late years.

491. And they carry no other cargo, I think?—Very little other cargo.

492. I used to hear that you so managed your trade that the cattle generally arrived in good health in England?—Yes, I think we can say that they arrive in pretty good health here.

493. You do not know the average length of the voyage from Denmark to London, do you?—From Esbjerg it is 36 hours, so far as I know, but when the ship goes from the east coast of Zealand, which is much further, it takes three days and three nights.

494. It is the case, as I have heard, that the cattle are put down, as it were, in sand, so that they find an easy sort of bed?—I am informed by the gentleman who is our veterinary adviser, and who has very often been on board, that generally there is sand.

495. With regard to your regulations for foot-and-mouth disease, you had the foot-and-mouth disease in 1875 rather badly in Denmark, had you not?—Yes.

496. Do you know whether, in order to stamp out foot-and-mouth disease, all movement of cattle in Denmark was stopped for any time?—No, it was not the case, because we had only 13 farms in the whole country that were infected, and every farm was put under quarantine, and a complete cordon was formed round it; so that it was not necessary to prevent the freedom of movement.

467. I understand from that that, although the foot-and-mouth disease was prevailing, it did not affect more than 13 farms?—It only affected 13 farms. Our country is of small extent, and there are many islands, so that of course there is not this network of railways; and it is much easier for the executive to control transport and to look after the animals.

498. Are your farms generally large or small?—Our farms are both large and small. The peasant farms, as we call them, which form the majority, are about the size of ordinary English farms, averaging from 40 to 100 acres; but the higher class of farms are much larger, reaching to 1,000, 1,200, and 1,500 acres.

499. When you speak of the foot-and-mouth disease being on 13 farms, do you think that many of those 13 farms were large farms?—No, they were small farms. I have given the number of the cattle in those 13 farms so that you will be able to see that. There were 147 cattle in those 13 farms, and, out of those, 130 were affected that year.

500. Were the 13 farms in the same district?—They were all in the Island of Zealand; but I must say that two of the cases occurred in the harbour of Esbjerg in Jutland; two bulls just imported from Great Britain were found to suffer from the foot-and-mouth disease and were killed immediately in the harbour; so that the foot-and-mouth disease did not really exist in Jutland. Therefore I ought to have said that there were altogether 128 cases in the Island of Zealand.

Professor GEORGE THOMAS BROWN, recalled; and further Examined.

Chairman.

501. I SHOULD like to ask you first, whether you have had any further intelligence since our last meeting with regard to the outbreak in Hull?—I received a letter this morning from the town clerk of Hull, in answer to inquiries which I addressed to him last week, chiefly with the view of finding out if anything had transpired which would lead to the impression that cattle plague had existed between the 22nd of March and the 5th of May, on which date the last outbreak is presumed to have occurred; and he says that, excepting those sheds where the cattle plague had been, none have been found empty; that is to say, in no case had any stock been removed, neither has any circumstance transpired which can be taken as evidence of the disease having existed there between the 22nd of March last and the 5th instant; further, he states two other cows which came into Hull, along with, and from the same place as, the cow attacked at Kirby's, have been traced by us, and are reported both to be healthy and doing well.

502. That letter, then, confirms your own idea as opposed to the post-mortem examination?—It does.

503. You consider that this outbreak was not really an instance of cattle plague?—It very materially strengthens the collateral evidence which is opposed to the idea of these cases being cattle plague.

504. With regard to the metropolis, have you had any fresh cases reported there?—We have had several cases reported during the last 10 days, but in every instance, on inquiry, they have turned out to be cases of other diseases.

505. What are your measures now in force?—The measures which are now in force are contained in the Order which came into operation on the 16th April, on which date the Privy Council took the action of the local authority in reference to cattle plague; subsequently, in consequence of information having been obtained of the removal of cows from Middlesex, near where cattle plague had broken out, to country markets, and from the further fact which was ascertained, that cows marked for slaughter in the Metropolitan Market had been bought by dealers and transferred to cowsheds in the metropolis, where they were seen by our inspectors, three Orders were passed on the 27th April; the first of those Orders totally closed the county of Middlesex, and prevented movement altogether out of the county, except into the metropolis to a slaughter-house, or to the Metropolitan Market; the second one compelled the slaughter in the market area of all animals sent to the Metropolitan Market; that was for the purpose of avoiding the sales which we found were taking place in the lairs outside the market, whence animals were removed to various premises over which we have no control; this Order also prohibited the movement of animals within the metropolis, except to a slaughter-house named in the license, or to the Metropolitan Market, where they would be slaughtered within the area. In every case the license was not to remain in force more than 12 hours; Orders are now in operation, and these remain in operation until the 1st day of June.

506. And under those Orders you are dealing by the central authority with Middlesex as well as with the metropolitan area?—We are dealing with the whole of the metropolitan police district, which extends for something like 16 to 17 miles round London.

Chairman—continued.

507. With regard to the continuation of the inquiry that we began on the last meeting of the Committee as to the effect of importation on the disease, the general allegation is that the losses from contagious diseases of animals in this country exceed the value of the imported animals, and that those losses are caused by the introduction of foreign stock, and that therefore foreign stock should not be admitted; is not that the allegation?—That is the general allegation. I should propose, in the first place, to avoid any discussion as to the amount of damage done, and to admit all that is alleged in reference to the amount of loss arising from the influence of contagious and infectious diseases. It appears to be a matter, so far as the argument is concerned, of comparative indifference as to the exact amount. There is no doubt whatever that the loss is very serious; but the fallacy which I recognise in the statement exists in the second part of the proposition, which refers the introduction of these diseases to the continued importation of foreign animals. On that point there appears to me to be no satisfactory evidence.

508. That is with regard to pleuro-pneumonia and foot-and-mouth-disease?—Exactly.

509. What system would you think necessary in dealing with these diseases?—In reference to cattle plague, as I stated before, the evidence is satisfactory that the disease is introduced by the importation of live animals from abroad. The system of slaughtering at the port of debarkation has failed in every instance. Therefore I should, without hesitation, propose to prohibit the importation of cattle from Germany and Belgium unconditionally.

510. You stated, I think, that the loss to the country would be the loss of German and Belgian cattle, which amounts to about 26,000?—Yes; but that would be compensated for by the amount of meat which they would send us, so long as it paid to send meat to this country.

511. But the probability would be that from Germany, in consequence of the meat being dear in that country, that trade would not form any very important part of our supply?—Yes.

512. It was in consequence of the meat in Germany being dear that you believed that only a small proportion would come to this country?—I think that is a reasonable conclusion.

513. That would limit the proportion with regard to cattle plague, but with regard to pleuro-pneumonia and foot-and-mouth disease, I understood you to say that the prohibition of the importation of foreign stock, in order to stamp out pleuro-pneumonia, should be accompanied by stringent regulations at home?—Undoubtedly, otherwise there is no reason to conclude that the prevalence of these diseases in this country would be materially diminished.

514. As long as the free movement in the country continues, these diseases would remain with us?—Undoubtedly. The allegation which is made respecting free trade in disease applies strictly to the movement of animals in the United Kingdom; it does not apply to the movement of animals

Professor *Brown.*

15 May 1877.

Professor *Brown.*

15 May 1877.

Chairman—continued.

animals from abroad, because the movement of diseased foreign animals which are landed in this country is severely restricted; and if we were to deal with our homesteads as we deal with foreign animals, at the landing places, it is quite certain that before this we should have made a very marked impression upon contagious diseases in general.

515. The introduction of diseases from abroad being irregular and occasional only?—That, I think, is a fair conclusion from the evidence. I refer to the introduction of the disease into the country, and not to its introduction to our ports. The introduction to the ports is regular and constant, but the escape of infected animals, which leads to the introduction of the disease into the interior of the country, is irregular and occasional.

516. That especially applies, does it not, to foot-and-mouth disease, with which a very large number of the animals imported were affected?—Undoubtedly.

517. Can you give the numbers in 1875 and 1876?—During those two years, in round numbers, we had something like 30,000 animals affected with foot-and-mouth disease landed at different ports.

518. Was there any accession to the diseases in the country from that fact?—During those years the disease declined. The decline began in the latter part of 1875, and during 1876 it was common to hear the remark made, "The foot-and-mouth has left us; there are no cases in the country."

519. Can you give the proportion of cattle out of those 30,000?—That includes the whole of the animal landed; the proportions will be found in the Tables in the Report.

520. I suppose you would admit that the importation of disease from foreign parts is occasioned by this irregular spread that you have described, because fresh centres of contagion are set up by it?—Undoubtedly; we add to the number of centres.

521. Is pleuro-pneumonia or foot-and-mouth disease more frequently introduced?—Pleuro-pneumonia, undoubtedly, in consequence of the impossibility of the disease being detected in the stage of incubation by any kind of examination.

522. The incubation of the disease being longer, it is almost impossible to guard against fresh centres of disease being formed in the country?—Quite so, under the present system.

523. What are the measures of prevention which you would suggest, if an attempt is to be made to stamp out both these diseases, beyond the suggestions which you have already made?—I should first propose to deal with the importation of foreign animals; and, in order to do that effectually, it would be necessary to amend the present Act in such a way as to give larger and more elastic powers to the Privy Council.

524. Giving, as you suggested the other day, a power to the Privy Council to appoint inspectors through the country?—To do what the local authority have already done. As I said in my last examination, we should require about 2,000 inspectors; there are already something like 1,800, so that the increase would not be very large. I do not, by the term inspectors, mean in all cases veterinary surgeons. It would be necessary that the country should be divided into districts, and that a competent veterinary surgeon

Chairman—continued.

should have charge of each district, and be in communication with our department.

525. Would you, then, allow the principal work to be done, as it is at present, by the police being appointed as inspectors?—The police and other persons not having professional knowledge, would act very effectively under proper direction.

526. Have you found that to be the case since you have taken the command in the local areas?—We have. We find that the police have given us very considerable assistance, particularly in the early transmission of notices which they receive; they are always in direct communication, by telegraph, with Scotland Yard throughout the whole of the metropolitan district, and sometimes we have had a telegram in a quarter of an hour (from Willesden, for example), after information of the disease has been given to the police at that point.

527. How would the cost of such a scheme be defrayed?—I presume that the cost would be defrayed, as now, by the local authorities.

528. And the expense would be very little greater than the present expense, because, as you say, the scheme would only require a small increase of the inspecting staff?—I should say that the expense would be very little greater than it is at the present time, and not to be compared with the amount of loss which is sustained by the ravages of contagious disease.

529. The advantage would be that you would gain uniformity of action throughout the country?—We should.

530. Are there any other recommendations that you would make under such a system; how do you propose to deal with the question which formed one of the subjects which was considered by the last Committee, viz., that of surplus ships' stores?—Under the head of foreign animals I should propose first of all, to prevent the landing of what are called surplus ships' stores. Animals may be brought from any port abroad, and landed in this country with the certificate of an Inspector of the Privy Council, which certificate is given after such an examination as he can make on board the boat, and is handed to any one who may happen to be at hand; there is no limitation as to its duration, and it may be used a week after it has been given, when the sanitary state of the animals may be very considerably modified.

531. When, in fact, the animals may have been brought in contact with any number of means of communicating disease?—It was a subject of considerable anxiety during the prevalence of cattle plague in the east of London. I knew at that time that butchers engaged about cattle plague animals might go on board a boat in any of the docks and might examine sheep or cattle, and might absolutely infect them with the disease; and they might nevertheless move those cattle two or three days afterwards with the certificate of the inspector who had seen them on their arrival to the effect that they were in perfect health.

532. The limitation as to the dealing with those stores was part of the subject matter of the consideration of the late Committee?—I believe it was.

533. But nothing has been done with regard to that since?—Nothing at all.

534. I understand you to say with regard to Schleswig-

Chairman—continued.

Schleswig-Holstein cattle that you thought they ought, under such a system, to be slaughtered at the port of landing?—Having reference to the possibility of cattle plague entering that country before we are aware of it, I should land them at defined parts of ports in this country for slaughter only.

535. Whilst with regard to countries which are at present unscheduled, such as Sweden, Norway, Denmark, Spain, and Portugal, they would remain as unscheduled?—They would remain as unscheduled.

536. Would you restrict their movement at all?—I should deal with them under the system which I propose to adopt with reference to stock in this country generally, and that would alter their position very much.

537. You would not allow them to go from where they were landed, excepting for slaughter, unless the district was declared free from disease?—I should, first of all, insist upon evidence being given that the country was free from disease, and that the arrangements were of such a character that, in all probability, it would remain free from disease. I should then allow them to be landed at ports where there were proper arrangements for their lairage and, if necessary, for their slaughter; and I should detain them for a longer time than at present; I think that 24 hours should be the minimum period, in order to give the inspectors every opportunity of detecting disease. Then they would only be allowed to go from the place of landing to a fat-stock market. From that market they might be subsequently removed by license to slaughter-houses, or, as the system, which I should hope to see ultimately developed, grew in extent, there would be arrangements in all large towns where fat-stock markets would be held for the slaughtering of all animals exposed for sale in those markets, in proper abattoirs.

538. Would you propose to enforce this system, which you have suggested, by severe penalties in the Act?—Undoubtedly. The only way of getting an order or an Act carried into effect would be by imposing very heavy penalties in case of infringement. So long as the amount of the penalty is less than the profit on the transaction, persons are found to break the law habitually. There are drovers now in the metropolis who have, under our orders, I was told yesterday, been fined 20 or 30 times, and they simply undertake the work partly for the excitement which attends it, and, further, for the remuneration which they obtain if they are successful, with the certainty that no loss can possibly happen to them, because their employers always pay the penalty for them.

539. But if the scheme which you have suggested for stamping out the disease is really to be tried, it must be accompanied by something more severe in the way of penalties than at present exists?—Undoubtedly.

540. That deals with the import of fat stock; how do you propose to deal with the importation of store stock?—My conviction is that foreign store stock, excepting a few animals for breeding purposes, and dairy stock, which I propose to deal with separately, are not required at all.

541. You mean that our breeding power is equal to the amount of feed that we have in this country?—We know that it sometimes exceeds our feeding power; but, in any case, if we want more store stock we may dispense with the use of lamb and veal or get it from abroad, and breed our own stores in that way.

542. I think I understood you to say that, with regard to the supply of dairy stock and other store stock, you propose that it should be only admitted under considerable restrictions as to its condition before it came over?—I think that it should be only allowed to come with a certificate of origin from healthy districts, and that it should be marked in such a way that all the animals could be kept under supervision for some months. I say that chiefly with reference to Dutch cows, which are so much esteemed by dairymen in this country; but I am not at all certain that we could not do without them, and in time I should hope to do so; because, so long as pleuro-pneumonia exists in Holland, it is almost impossible to avoid its introduction into the dairies in London and other towns.

543. You would treat Holland as one of the scheduled countries, slaughtering everything at the port of debarkation?—Slaughtering in all cases the fat stock, and only allowing dairy stock to be introduced under these restrictions.

544. But supposing that you did away with the introduction of dairy stock, what then?—Then I should simply place Holland in the schedule.

545. How would you propose to deal with the stock of the country itself for the purpose of stamping out the disease absolutely?—I think there is no escape from the conclusion that we must entirely interfere with the free movement of stock in this country if we seriously intend to get rid of these diseases.

546. Until these diseases are stamped out?—Until they are entirely stamped out. For that purpose, a general scheme would include the holding of markets for fat stock by license, and the subsequent movement of animals to specified slaughter-houses; store markets must also be held on similar conditions.

547. Practically you would place the most stringent regulations for a time upon the whole movement of cattle in the country, either fat or lean?—Decidedly.

548. For the purpose, as I understand, of stamping out pleuro-pneumonia and foot and mouth disease, which you believe to be epidemic in the country?—They are so far naturalised that, while we are constantly supplying new material in the shape of fresh susceptible animals, the diseases will inevitably continue as they have in other countries quite irrespectively of the importation of fresh animals from abroad.

549. With regard to the cowsheds in large towns, and especially in London, do you believe that those are centres for disease?—I have no doubt at all of that fact. The cowsheds in London, Dublin, Glasgow, Edinburgh, and other large towns are the chief centres of contagious disease, chiefly pleuro-pneumonia.

550. Do you think it would be possible in any way to get rid of those centres of infection in large towns?—I am afraid that it would be very difficult to abolish them entirely, but I think that efforts should be directed to concentrating them as far as possible in the suburbs; and, as far as it could possibly be done, it would be desirable to prevent the conversion of premises of all kinds into cowsheds merely for the purpose of holding three or four cows. A large number of places

Professor *Brown.*

15 May 1877.

Chairman—continued.

exist in London, now without any license, and it is exceedingly difficult to detect an outbreak of disease in them when it does occur.

551. If they are continued, they should be continued under strict supervision?—Under strict supervision, and sanitary arrangements should be insisted upon.

552. In dealing with the outbreaks of pleuro-pneumonia and foot-and-mouth disease, would you make any regulation with regard to the animals that were brought into infected premises?—I think it would be absolutely indispensable that wherever an outbreak is detected (and it would be part of my scheme to make such inquiries that the majority of outbreaks would be detected), the introduction of fresh stock should be prohibited until the disease had entirely ceased. I may mention in that connection that something like half the cases in Middlesex during the past year were kept up on one man's premises by the constant introduction of fresh stock into a shed where pleuro-pneumonia existed.

553. It would be absolutely necessary, therefore, in those cases, to stop any such addition to the stock of the place?—It would.

554. Would you slaughter in the case of pleuro-pneumonia?—I should slaughter without hesitation all the animals which gave any evidence of the disease, and I should deal with the rest of the herd according to circumstances. I should slaughter if the animals were fat and in a fit state for the butcher, or try inoculation, which I have frequently suggested should be tried upon a large scale, so that we may get positive evidence as to its efficacy; and, in any case, I should perfectly separate the animals from all others on the premises, and not allow any fresh stock to be brought in contact with them for two months after the cessation of the disease.

555. That is a system which you suggest as a means of stamping out these diseases, whilst you say that under the present system, though you may limit the diseases, you will never extinguish them?—The present system of slaughtering merely amounts to getting rid of one animal and putting another animal in its place on the following day, and sometimes on the same day; I believe that under that system it is quite vain to hope that the disease would even be materially diminished, although the cost of compensation, even under that arrangement, is excessively heavy.

556. Under your scheme, how would you propose to deal with the Irish stock?—First, Ireland must consent to prohibit importation from all countries, including Great Britain. It would be a matter of small consequence to Ireland; they import very few animals indeed; and, except for breeding purposes, I should prohibit importation entirely.

557. I understand you to say that the present import from Great Britain to Ireland is insignificant?—It is quite unimportant, and it consists chiefly of calves which are got in without observation, and which have taken foot-and-mouth disease to that country repeatedly.

558. The system that you have suggested would introduce a total change into the whole present cattle traffic of the country, would it not?—Doubtless, it would; because under the present system, animals are moved about in all directions, just to meet the exigencies of trade. A man may send animals from the north of England; his neighbour comes to the Metropolitan Market and buys them, and probably takes them all the way back again. I have known instances of a salesman getting an order for several hundred animals to be sent over to France; he has gone down to Southampton and intercepted the animals that were brought over, and sent them back again to the country from which they came. Under this system it is, of course, impossible that infected animals could be prevented from carrying disease in all directions.

Chairman—continued.

559. I suppose that the cost to the country of the change which you have suggested would be considerable?—Undoubtedly it would, for the time.

560. Have you considered what relation it would bear to the losses that fall upon the country from the disease?—I should apprehend that the total cost, as compared with the losses sustained, would really be insignificant. We have no means of absolutely calculating the amount which would be expended, because the system has never been tried.

561. But, notwithstanding the cost, if its result was, as you suppose it might probably be, to stamp out the disease, the saving to the country would be considerably in excess of that cost?—Most certainly.

562. Do you look forward, under this system which you have suggested, to a development of the dead meat trade?—That appears to me to be the point to which all regulations should tend. I cannot imagine that any effective system of dealing with contagious diseases can possibly be continued, unless the dead meat trade very largely indeed takes the place of traffic in live animals.

563. And you think that would be feasible in time?—I have no doubt whatever that it might, so soon as people became converted to the idea, be carried out without any very great difficulty; but for a long time the whole system which I propose would be met by systematic opposition.

564. I suppose that when once you had stamped out the disease under your system, you would then be able to set up the absolute slaughter of foreign animals at the ports?—Having once cleared the country of disease I should propose to run no further risk; and having excluded cattle from Germany and Belgium, as countries through which we might take cattle plague, I should slaughter all other imported animals at the place of landing in this country. I believe that that precaution would effectually preserve us from both foot-and-mouth disease, and pleuro-pneumonia.

565. And by a gradual process of this sort, and a gradual development of the dead meat trade, you would arrive at a state of things which you believe would keep this country free from these diseases?—Presuming that all these regulations could be properly carried into effect.

566. Is there any other point upon which you wish to give evidence?—Nothing more.

Mr. *W. E. Forster.*

567. Your first answer to the Chairman was that you are the professional officer of the Veterinary Department; will you explain to the Committee what that means?—I may best explain that by stating that when Dr. Williams resigned, shortly before his death, the office of secretary was abolished, and we returned to the former

Mr. *W. E. Forster*—continued.

former state of things, in which Professor Symonds was the professional head of the Department, and the Lord President, as represented by the clerk of the Council, was the official head. Under the present circumstances, I am in the place which Professor Symonds occupied as the virtual head of the Department, and the Lord President, as represented by the clerk of the Council, is the official head.

568. Then, in fact, in addition to your previous duties as the professional adviser of the Department, you now perform the duties that Dr. Williams used to perform as secretary?—I do.

569. That being the case, I wish to call your attention to the Report of the Committee of 1873, and to ask you if you are able to state whether the recommendations of that Committee have been carried out. The first recommendation is with regard to cattle plague:—"That Section 66 of the English Act, which gives a local authority power, if they think fit, to order the slaughter of any animal which has been in contact with an animal affected with cattle plague, should be so far altered as to make it the duty of the local authority to order such slaughter;" has that alteration been made?—It has not.

570. The next recommendation is: "That discretion should be given to the local authority to order the slaughter of any animals on any premises adjoining those in which the disease exists, upon a certificate of any inspector, being at the same time a duly qualified veterinary surgeon, that such slaughter is necessary to prevent the spread of the disease;" has that recommendation been carried out?—It has not.

571. Does that require an alteration of the Act?—It would require an alteration of the Act.

572. Both those recommendations could only have been carried out by an Act of Parliament?—That is so.

573. Am I right or not in believing that there has been no Act passed since that time, as far as regards English animals?—There has been no Act passed since 1869.

574. In your evidence on Friday last you stated, in answer to Question 17, that you considered that it was very necessary that there should be that power to order the slaughter of animals; has that opinion been confirmed or not by this last outbreak?—It has most certainly been confirmed, for I have no doubt at this moment, from the facts that have transpired since the discovery of the disease in Limehouse, that, had we had full power at the time to order the slaughter of the animals, the disease might easily have been extinguished in less than a month.

575. Upon what particular fact do you base that opinion?—Chiefly upon the circumstance that the disease prevailed for nearly two months in a certain district in the east of London, which was easily marked upon the map, and which could easily have been dealt with if we had had power to slaughter animals on premises which we believed had been exposed to the infection.

576. Of course you did not attempt to do it, because it would have been perfectly illegal for you to have done it?—Quite illegal.

577. That applies to the Recommendation (*b*), I think?—It does.

578. Have you found any evil arising from the alteration contemplated by Recommendation (*a*) not being carried out?—Not during the last outbreak.

Mr. *W. E. Forster*—continued.

579. That is, I presume, because the local authority with which you had to deal was the Metropolitan Board of Works, who, I suppose, did at once what you wished?—They at once did what we required with reference to the slaughter of animals which had been herded with infected animals, with a single exception. One animal is still in a shed where cattle plague existed; the owner applied to be allowed to keep it as it was a favourite animal, and, in spite of my strong remonstrance at the meeting of the Board, they allowed it to be kept alive.

580. Supposing that the cattle plague had got well out of the Metropolis and into the country districts, I suppose the want of the alteration recommended in Recommendation (*a*) would have been very serious, would it not?—It would have been very serious.

581. I am not, of course, asking you for any opinion that may be held by the heads of the Department, but have any facts come to your knowledge since the Report of the former Committee, that would make it desirable that an Act should not have been passed embodying these recommendations?—I am not aware of any.

582. The next recommendation is, "That compensation should be extended for any animal so slaughtered;" that would, of course, follow naturally from the previous recommendations?—It would be included in the other recommendations.

583. Now I go on to pleuro-pneumonia. The first recommendation with regard to pleuro-pneumonia is: "That the slaughter of all cattle affected with this disease should be compulsory, and that there should be compensation for cattle so slaughtered;" has anything been done to carry out that recommendation?—That recommendation was met by an Order of the 2nd of August 1873, immediately after the Report of the Committee was published.

584. The next recommendation is: "That the Rules in the 7th Schedule of the English Act, should be so altered as to provide that cattle which have been in the same shed, or which have been herded with diseased animals, may be moved under regulations for isolation for two months;" how was that met?—No alteration has taken place in any of the schedules of the Act of 1869.

585. And that could not have been done without an alteration of the Act?—Certainly not.

586. With the experience that you have gained since 1873, what is your opinion with regard to that recommendation?—I have no doubt that it would have had a very beneficial effect.

587. The next recommendation is: "That the power given by Section 54 of the English Act, to an inspector to apply the pleuro-pneumonia rules to any premises in which he finds that disease to exist, should be extended to any premises in which he finds that it has existed within 28 days;" what is your view with regard to that recommendation?—That would have been most important in its operation.

588. Will you state in what way it would have been important?—I may cite a single instance, where an animal was seized some time ago in my presence in the Metropolitan Market; the owner stated that he had 19 others in his shed in the country; the local authorities were informed of it; there was no question of the fact that the animal came from that shed, but as the inspector found all those animals in perfect health he took

Professor *Brown.*

15 May 1877.

Mr. *W. E. Forster*—continued.

no action. Subsequently the disease was detected, on those premises, but then there were only eight animals left; the remainder had been removed, nobody knew where.

589. What is your view with regard to the next recommendation, "That the time during which the pleuro-pneumonia rules should be applied to any premises in which the disease has been discovered, should be extended from 30 days to two months"?—That is also very desirable.

590. That could not be done without an Act of Parliament?—It could not.

591. You are probably aware that evidence was given before the last Committee which tended to show that it was of very little use to attempt to isolate pleuro-pneumonia cases unless you extended the isolation to two months, because the period of incubation so often lasted that time?—That is the case, and it has been proved to be the cases by repeated instances since.

592. There has been nothing to shake that opinion in the minds of veterinary doctors since 1872?—Nothing at all.

593. But rather to confirm it, I think?—Quite to confirm it. It has been noticed as rather a singular circumstance that so many outbreaks have occurred the day after the pleuro-pneumonia rules had ceased to apply.

594. Then as to sheep-pox, the first recommendation is: "That the slaughter of all sheep affected with sheep-pox should be compulsory with compensation." Has anything been done with regard to that?—No steps have been taken in that direction; we have had no sheep-pox since.

595. Coming now to foot-and-mouth disease the Committee recommended "That the Privy Council should cease to issue orders for the check of this disease. That Section 57 of the English Act, which makes the exposure or carriage of animals affected with a contagious disease an offence, should continue to apply to foot-and-mouth disease, but owners shall be relieved from the necessity of giving notice to the police of the existence of this disease among their stock." Has that been carried out?—As regards Sub-section (*a*), that was done in the same Order of August 1873.

596. But Section (*b*) could not be carried out without an alteration of the Act?—It could not.

597. Has Sub-section (*c*), which contemplated the movement under proper precautions of animals so affected been carried out?—That was carried out in the same Order.

598. The result, I think, of those Orders that were issued in August 1873, was that for a time the action with regard to foot-and-mouth disease was made the same all through the island?—It was.

599. Is that the case now?—The Order of August 1873 in respect of foot-and-mouth disease was almost immediately revoked in consequence of deputations which came from various societies, the Royal Agricultural Society among them, urging that the former restrictions should be re-imposed.

600. When you say that it was almost immediately revoked, when was it revoked?—I forget the exact date, but some two or three months afterwards.

601. It was after a change of Government, was it not?—I think not, but I am not quite sure of that.

Mr. *W. E. Forster*—continued.

602. The Order was issued in August 1873, was it not?—It was.

603. And in was revoked in March 1874?—I believe it was.

604. The representations were made by different local authorities, were they not?—They were.

605. I think when you were examined before the Committee in 1873 you were of opinions that the restrictions with regard to foot-and-mouth disease, whatever they were, should be the same all through the island?—Decidedly.

606. Now that, by the re-enacting of this Permissive Order, they are different throughout the island, is your opinion changed?—Not in the slightest. My impression then was, and still is, that the action taken to repress foot and mouth disease was merely obstructive without being effectual.

607. You find in the same report, a paragraph with regard to compensation, proposing that the local authority should be empowered to grant compensation "to an extent not exceeding three-fourths of the loss sustained by the owner, provided that it does not exceed 25 *l.* for any animal;" that has been done, has it not?—It has not been done in that form. The local authority are empowered to pay compensation to the extent of three-fourths of the value of the animal in the case of pleuro-pneumonia, but nothing was said about the loss incurred by the owner.

608. There was a doubt, I think, in the mind of the officers of the Department as to whether that could or could not be done without an alteration in the Act?—I understood that there was at the time considerable doubt as to whether it could be done without an alteration in the Act.

609. But the office ruled that they would run that risk and make the compensation?—They did.

610. What have you done with regard to cattle plague?—By the Order of April the 12th we took action in place of the local authorities in the Metropolitan police district.

611. But what compensation do you pay in a case of cattle plague?—Nothing has been done yet since we took the matter in hand, but the local authorities are empowered to pay a sum not exceeding one-half of the value of diseased animals, and three-fourths of the value of those that are herded with them, but are not actually diseased.

612. Am I right in supposing that the compensation for cattle plague is according to the terms of the old Act?—It is.

613. And not in accordance with this recommendation in regard to pleuro-pneumonia?—No.

614. Therefore you are now paying less compensation for cattle plague than you would be for pleuro-pneumonia?—That is so.

615. And that would not have been the case if this alteration in the Act had been made?—No, it would not, certainly.

616. I see that there is a recommendation: "That the regulations with regard to the stoppage of disease should cease to be varying or permissive;" you have already answered that they are varying or permissive at the present time?—They are.

617. But it is not your opinion that there is any advantage in that?—It is certainly a great disadvantage.

618. Then

Mr. *W. E. Forster*—continued.

618. Then there is a recommendation with regard to Scotland, that there shall be one local authority for each county; do you know whether anything has been done about that?—I believe that nothing has been done with reference to altering the arrangement respecting local authorities.

619. The Committee also recommended: "That the power of entry, given by Section 32 of the English Act to the inspector or other officer of the local authority when he has reason to suspect the existence of cattle plague, pleuro-pnenmonia, or sheep-pox, should be extended to all contagious diseases except foot and mouth disease." Has that recommendation been carried out?—Nothing has been done in that direction.

620. Have you any reason to suppose that it would have been an advantage to have had that change?—I have no doubt it would in many cases, particularly, perhaps, in reference to glanders, which is often suspected to exist on premises where there is no power to enter.

621. With regard to the recommendation as to Ireland, an Act has been passed, has it not?—An Act has been passed relating to pleuro-pneumonia.

622. How far does that Act carry out these Recommendations (*a*), (*b*), and (*c*)?—It carries out the recommendation in reference to the slaughter of animals affected with pleuro-pneumonia.

623. Does it carry out the recommendation "That the Regulations in Great Britain and Ireland with regard to contagious diseases should be similar"?—It does not.

624. Does it carry out the recommendation "That such Regulations should be carefully enforced at the landing places, both in Great Britain and Ireland"?—It does not.

625. Does it carry out the recommendation "That the Irish Government should take steps, by inspection at Irish ports, to prevent the shipment to Great Britain of any diseased or infected animals"?—The Irish Government have taken steps to inspect animals at Irish ports, but not in consequence of any regulation which has been made by the Privy Council.

626. Then I gather that, looking at the recommendations of that Committee, so far as Great Britain is concerned, no recommendation requiring alteration in the Act has been carried out?—None.

627. And your opinion, that every one of these recommendations ought to be carried out, remains the same as it was in 1873?—It does.

628. And with regard to those recommendations which could be carried out by Order, they were carried out immediately after the passing of the Act?—They were.

629. But, as regards foot and mouth disease, they were revoked about six months afterwards?—They were.

630. With regard to your answer about cattle plague in 1872, the information was obtained in the office, was it not, which led us to expect that we should have an import of cattle plague before the ship really arrived?—It was.

631. Do you recollect how that information was obtained?—I do not remember precisely, but I have an impression that it was given by one of the importers.

632. You stated, I think, in answer to the Chairman, that in 1872 the cattle plague was for three months in one district in the East Riding?—Altogether it remained in the East Riding, in three districts, during that period before it was finally stamped out.

633. Can you give the Committee a notion of the size of those districts?—So far as the area over which cattle plague extended is concerned, I should say that a radius of two miles in each case would include each district.

634. I think that the precautions which were adopted prevented the cattle plague from getting out of those districts?—They did.

635. Do you recollect the number of animals that were slaughtered in the East Riding?—Two hundred and twenty-two animals.

636. Will you be kind enough to hand in a return containing the number, and, so far as you know, the sums paid for compensation for all the animals that were slaughtered in consequence of the cattle plague, in 1872, in the East Riding of Yorkshire and in London?—I will.

637. There was an animal washed ashore, and there was a good deal of fear that that animal might bring disease; but that was not the case, was it?—I think there were something like 48 carcases altogether washed ashore on the Lincolnshire coast, but in no case did any disease arise in consequence.

638. Would you consider that the cattle plague was really bad in Hamburg in 1872?—No; it did not prevail to anything like the same extent that it did on the last occasion.

639. This has been a decidedly worse attack, has it not?—The worst attack that Germany has had since our department has existed, certainly.

640. Do you think that the movement of troops in Russia has had anything to do with it?—From the accounts which we have received, it does not appear to have been in any way connected with the movement of troops. The diseased animals were smuggled over the frontier by one man, who has been imprisoned and subsequently shot in consequence of having made his escape and refusing to answer the sentry's challenge; so that he was not brought to trial, and the chief facts therefore were lost; but there is no doubt that the animals from that frontier were sent right across the country, stopping at several markets, getting first to Breslau, then to Berlin, and then on to Hamburg and other parts.

641. At present the law in Germany entirely prohibits the import of cattle from Russia or Poland, does it?—Entirely.

642. Is that old habit which there used to be of their white cattle going to Moravia to be fed in the distilleries discontinued?—Germany prohibits the introduction of the white or grey breed from any part.

643. But Austria allows them to get into Moravia, does she not?—Austria allows them to get into Moravia.

644. Is there no fear of their getting from Moravia into Germany?—If the regulations are strictly enforced, there should be no fear, because the animals are so very easily recognized.

645. But the regulation that they have in Germany does not prohibit the import of cattle from Moravia, but it simply prohibits the import of these steppe cattle?—Yes.

646. You saw the cattle that came by the "Castor," did you not?—I did.

647. Were they steppe cattle?—They were a mixed

Professor *Brown.*

15 May 1877.

Mr. *W. E. Forster*—continued.

mixed lot of Polish and Silesian cattle, and half-a-dozen breeds.

648. Were those Polish cattle any of these white or steppe cattle?—No, they were none of them steppe cattle.

649. How do you account for the fact that cattle plague is such a terrible disease in England, and yet that, although it must have existed now, as far as we know, for centuries almost in Russia, it does not seem to diminish the number of the Russian herds?—It appears not to affect the Russian breed to anything like the same extent as it does the English breed, or indeed the animals in the other parts of the continent. Probably the difference of climate has something to do with it, but the recoveries in Russia are stated to be very considerable, sometimes amounting to 75 per cent.

650. With regard to your recommendations to the present Committee, putting aside cattle plague altogether, would you, or would you not, recommend these very stringent regulations that you have just mentioned with regard to pleuro-pneumonia and foot and mouth disease?—Upon the understanding that it is essential, or even that it is economical to get rid of these diseases, I certainly should.

651. In your answers to Questions 341 and 342 in your examination on Friday, you say that you do not believe that the stock owners of the country would comply with the regulations that would be necessary?—That is my conviction. If those regulations were enforced, what people in this country call free trade, that is to say, the right which every man possesses to drive a bullock in any direction he likes, and to any market, and to as many markets as he pleases, must necessarily be totally interrupted, and I do not believe that traders generally would put up with those restrictions.

652. Turning to Question 1461 in your evidence before the former Committee, you were asked this question: "Is there not this difference between the foot and mouth disease and the cattle plague, that not only is the former disease hardly to be compared with the latter in virulence, being so much less virulent, but that while we have great hope of being able absolutely to stamp out the cattle plague, we should have very little hope of absolutely stamping out the foot and mouth disease;" and your reply is: "It is my conviction that we should never succeed in getting rid of it; and that is the experience of the whole of Europe." Do you still adhere to that opinion?—I still retain that conviction from the circumstance that I have just stated, namely, that the restrictions in order to get rid of it must be of such a character that we should never submit to them.

653. Then you are asked at Question 1462: "Therefore, in fact, to preserve ourselves against the foot and mouth disease, we must look forward not only to such stringent restrictions as you say were found very difficult during the cattle plague, but we must look forward to the continuance of them as a general rule, and not to their being laid down as a severe remedy for a temporary disease?" And your reply, "Undoubtedly the restrictions must be permanent." Do you still adhere to that opinion?—I apprehend that if we could apply the measures which I have just suggested, and if we had unlimited power to make such alterations as we might think necessary in different districts, we might ultimately succeed in getting rid of the disease.

Mr. *W. E. Forster*—continued.

654. I dare say that you will remember, that before the last Committee there were some witnesses who stated that they thought that stopping the movement of cattle for six weeks would enable foot and mouth disease to be stamped out of the island?—I remember the statement.

655. You are not of opinion that that time would be anything like enough?—Certainly not; if we could do it in six years, I should think the work would be very well done.

656. Did you hear the evidence of Count Danneskiold?—Only the latter part of it.

657. Did you hear his evidence with regard to their action as to foot and mouth disease?—I know what their action has been from the printed papers which they have forwarded.

658. They appear to have stamped it out, do they not?—For a great many years they have not had it to any extent.

659. His statement that when they had it in recent years it was only in 13 small farms, would lead you to suppose, would it not, that it would be quite easy to stamp out the disease, if you had merely that to deal with?—Perfectly so, because the same thing has been done in Australia, I believe, on two occasions.

660. On page 4 of the Report of the Committee of 1873, you will find these passages: "Some agriculturists have recommended very stringent measures, such as the stoppage of all fairs and markets, and of the movement of animals, except by license, as during the prevalence of the cattle plague. On the other hand, there has been evidence of much weight, both by agriculturists and by professional witnesses, tending to show that such enactments would meet with strong opposition, and would be difficult, if not impossible, to carry out. Your Committee have come to the conclusion that it is hopeless to attempt to extirpate, or even materially to check this disease, unless the above-mentioned stringent measures are strictly enforced; and they also believe that such enforcement would require a costly and numerous staff of inspectors, and amount of supervision by the central authority which would excite much local opposition, at any rate in Great Britain, and such an interference with the home trade in animals as would much affect prices, and would induce not only the consumer, but the producer, to consider the remedy to be worse than the disease." Do you agree with that last paragraph, or not?—I quite agree with it.

661. I think I may understand, from your stating, that you agree with it, combined with your previous answers, that if you were asked, as a veterinary doctor, or as an officer of the veterinary department, how, supposing that full power was given to that department, the disease could be stamped out, you think that it possibly might be stamped out, but that you are of opinion from your knowledge of English farmers, and of English feeling, that the difficulties of using that power would make it almost impossible to do it?—That is my conviction, even from the experience that we have had since we took the cattle plague into our own hands. I found it necessary to arrange for an order to be passed to shut up Middlesex and the Metropolis, and to slaughter in the Metropolitan Market for the space of one month. I asked the Lord President to do it, and

Mr. *W. E. Forster*—continued.

and without any hesitation, he did it. I believe it was a sternly necessary measure. We have created an immense disturbance, and we have brought down upon us already two deputations threatening the population of London with starvation, all the drovers with ruin, and the very prompt closing of the Metropolitan Market as an institution.

662. I suppose the manner in which public opinion would view any step with regard to cattle plague would be entirely different from the manner in which it would view measures for stamping out foot and mouth disease?—Undoubtedly widely different.

663. From your experience, do you imagine that it would be possible to carry out in England these regulations, which you say would be necessary before you could stop the foreign import on account of foot and mouth disease?—I do not; but I also contend that nothing short of these regulations would be worth trying.

664. Therefore I understand you to say that it is vain to hope to get rid of foot and mouth disease by merely stopping the foreign import?—Quite so.

665. And that it would be ridiculous to stop that import, until you put in force regulations with regard to the home trade, which you do not believe would be submitted to?—Quite so, that is my view.

666. Now with regard to pleuro-pneumonia, it is much more difficult, is it not, to stamp that out?—It is more difficult on account of the difficulty of detecting the disease in its earliest stages.

667. If it were necessary to stop the movement of animals for a week on account of foot and mouth disease, it would be necessary to stop it for a month or six weeks on account of pleuro-pneumonia, would it not?—Yes, or for a longer period still; I should take two months.

668. Therefore, although the inducement to stamp out the disease would be greater because it is so much more destructive, the inconvenience from the attempt would also be much greater?—It is alleged that the damage done by foot and mouth disease is much greater than the damage done by pleuro-pneumonia.

669. Then, as regards pleuro-pneumonia, you would not suggest these regulations as being upon the whole desirable?—My chief objection to the scheme, which I myself propose, would be that it would excite so much opposition that it would be impossible to carry it into effect.

670. You, with your great knowledge of the subject, having been asked how the thing could be stopped, your suggestions merely mean this: "If I had despotic power given to me and could ride over the feeling of the country, or the inconvenience that is felt by farmers, I could do it in this way?"—That is my idea.

671. We now come to your recommendations with regard to cattle plague; you did not make these recommendations to the previous Committee, did you?—I did not.

672. Has there been any other fact, except this last outbreak of cattle plague, that has induced you to make them?—No, the last outbreak of cattle plague quite convinced me that even with the system that we have adopted at Deptford, where we believe that we have everything far more complete than we have at any other port, the arrangements were not sufficient

Mr. *W. E. Forster*—continued.

to prevent the introduction of the disease into the country.

673. I understand you to mean that they are not sufficient absolutely to secure you against the possibility of the disease being imported?—They are not even sufficient to give us a reasonable security, because every time cattle plague has approached the coast it has got into the interior.

674. You are going to give us a return of the loss in 1872; what do you imagine the loss has been this time?—The actual money loss, I should say, would be something like 10,000 *l.* or 12,000 *l.*

675. Do you, or do you not, think that it is reasonable to expect that you would be able to stamp out cattle plague if it were to come in again, as quickly as you did in 1872, and as you hope to have done this time?—Presuming that we obtained as early information of the outbreak as we did on this occasion, I have no doubt that we could stamp it out much more quickly.

676. Your faith in the power to stamp out cattle plague has not diminished?—Not at all.

677. Then does not that fact cast some doubt in your mind upon the necessity for such a very great change in the trade as you suggest, to stop the possibility of cattle plague coming in?—I base these recommendations upon the broad principle that so much alarm is caused in the country by the appearance of the disease, and so many oppressive restrictions are made in quarters where there is not the slightest necessity for them, and so much injury is caused to trade generally by the mere suspicion of the outbreak, that it would be almost worth any cost to make ourselves perfectly free for the future.

678. Have you not also felt that it was your business to tell the chiefs of the veterinary department how we could be secured against all danger of cattle plague?—Certainly; I felt that a part of my duty.

679. And therefore it was much more your business to state that than it was to enter into the possible loss that might follow from those measures being taken?—Quite so.

680. With regard to the import of live cattle into Great Britain, and especially into London, in the first place, what do you now think is the proportion that the import of cattle bears to the consumption of cattle for the whole island?—I am sorry to say that I have great distrust of all the calculations which have been made; I quite fail to see on what fair basis any calculation can be made at all. The statement which is generally accepted is that the total amount does not exceed 5 per cent. The calculation which was made in the Veterinary Department, places it at from 10 to 14 per cent.

681. At Question 347, in the evidence which was given before the former Committee in 1873, Dr. Williams said that he thought that in the year 1870 the home supply was about 60¼ per cent. of our live cattle; that the Irish supply was 27½ per cent., and the foreign supply 12¼ per cent.; have you made any estimate with regard to that calculation?—At the time that it was made, I quite failed to follow Dr. Williams in his calculation, and I have repeatedly since endeavoured to substantiate it or to disprove it, and, from the figures given, I have failed to arrive at any conclusion whatever.

682. Therefore it may be, so far as you know,

Professor *Brown.*

15 May 1877.

Mr. *W. E. Forster*—continued.

5 per cent., or it may be 15 per cent.?—Yes, and I believe so far as everybody else knows.

683. With regard to the metropolis we know more about it?—We know, certainly, that something like 45 per cent. comes into the metropolitan market.

684. It was a very little less last year than it was the year before, I think?—There was a very slight difference.

685. How far do you think that the dead meat would affect the calculation?—I do not apprehend that the dead meat would much affect the quantity of live stock, because that depends so entirely upon another set of traders. The prices have more to do with the quantity than any other circumstance.

686. Supposing that the suggestion which has been made by some gentleman was carried out, that all importation of live stock into the country, and, therefore, into the metropolis, should be stopped, do you not imagine that that would very considerably affect prices in the metropolis?—There cannot be a doubt that it would be made a reason for sending the prices up at once.

687. Quite independently of the beliefs and anticipations, there would be such a diminution of the supply that it must send the prices up?—Unquestionably it must.

688. Would you think that your position, as connected with the Veterinary Department, would be a very pleasant one a few weeks after that Order was issued?—I am satisfied that it is anything but a pleasant one, even under the three Orders which are at present in operation, particularly in the case of the one shutting up Middlesex and the metropolis, and the Metropolitan Market. I rather doubt if it would be safe for me to be in the Metropolitan Market after dark under the present circumstances.

689. But can you give any idea to the Committee as to what would be the probable effect upon the supply of food in London of stopping the import of all live stock?—If it were done immediately, I have no doubt that the result would be that we should fail to receive the greater portion of those supplies.

690. And, so far as you can calculate, that is very nearly half the supply of cattle that were killed in London last year?—Of the cattle that were sent to the Metropolitan Market. Of course a certain number of them are taken out again to large towns.

691. But that would rather make the proportion of the foreign animals greater, would it not?—Both foreign and English are taken out.

692. As none of the Deptford cattle can be taken out, it would rather make it greater, would it not?—It would.

693. When did you first begin to hear of the American import of dead meat?—In the autumn of last year.

694. Would you think that we really know much about that import until we have had it tried by a summer?—So far as I can judge from the evidence that has been published, there is nothing definite on the subject. It seems to be a question whether the whole thing is a speculation or not, and whether or not we shall be able to move meat from the landing places in the very hottest weather, without considerably damaging its quality.

695. I see that in your previous evidence you stated that dead meat was imported into New York very much; you are aware, I suppose, that the heat in New York is much greater than it is in London in the summer?—Yes.

Mr. *W. E. Forster*—continued.

696. Do you know whether the dead meat import went on during the hot months in New York?—I am not aware.

697. Is the dead meat trade increasing between Aberdeen and London?—I am not aware of its increase to any great extent.

698. Do you know whether dead meat comes in with the help of ice from any place, except from the States?—I believe not. I am told by the butchers that beef from Scotland is not brought in any quantities during the hottest weather.

699. Now with regard to your recommendation as to the cattle plague; I understand you to say that you would stop all import of live cattle from Germany and from Belgium, excepting from Schleswig and Holstein, why would you exclude Schleswig and Holstein?—I propose to put Schleswig and Holstein in the schedule, so that the small risk of introduction of cattle plague into that country should be met by slaughter at the ports until we hear that it has got into the country.

700. How would you prevent the other German cattle getting through Schleswig?—I propose that Schleswig should deal with it as it does now, and give us the same guarantees not to import from other countries.

701. I suppose you are aware that those are guarantees for which we must really look to a foreign government, but which we have no right of enforcing, and that the temptation would be very much stronger if there was no import at all allowed?—Undoubtedly.

702. Besides, has not the cattle plague got into Schleswig?—I believe that on each occasion it has reached Hamburg.

703. I suppose, if you stop the import at all from Germany, you would be more anxious to stop it from Hamburg than from anywhere else?—Certainly.

704. How far is Hamburg from Schleswig?——The Hamburg market is partly in the Holstein district.

705. Would it not be difficult to maintain a prohibition with regard to Hamburg which did not apply to Schleswig and Holstein?—It would be difficult, but I think that it might be done; and, in the absence of guarantees, I think we should be compelled to prohibit the importation from Holstein also.

706. Supposing that we had to prohibit it from Schleswig and Holstein as well, how many cattle were imported from Germany altogether last year?—About 69,000, including Schleswig and Holstein.

707. How many were imported to the port of London?—The number of cattle imported from Germany into the port of London was 55,328.

708. In that year there were imported into London altogether 147,000 cattle, I think?—Yes, there were.

709. Consequently, if you had to stop the whole of the German import, including Schleswig, you would strike off at once one-third of the foreign import?—We should.

710. That means about 15 per cent. of the total consumption of cattle in London, does it not?—Yes.

711. Would you let the sheep alone?—Dealing

Mr. *W. E. Forster*—continued.

ing with cattle plague exclusively, I should propose to land the sheep only for slaughter, as we are doing now.

712. But I understand you to say that at the present time, or at least during this late outbreak, a great many sheep were affected?—In the district of Emden chiefly.

713. How would you be able to justify a measure which let in the sheep while you excluded the cattle?—I should justify it on the principle that we have not had the cattle plague introduced into this country by foreign sheep, and, so far as I am aware, no sheep affected with the disease have been landed in this country, so that I should meet the slight risk by slaughtering them at the port of landing.

714. But I understood you to say that you were so very fearful of risk that you would even stop the import of dead meat when the cattle plague existed?—I should stop the import of sheep and goats, and also meat and other products of animals, when I knew the cattle plague to exist.

715. What are the present regulations in the office for obtaining information as to cattle plague getting into Germany?—By the international arrangements, we agree to telegraph to certain foreign countries, including Germany, any outbreak of cattle plague in this country, and they on their part agree to telegraph to us as soon as they obtain information.

716. You have every reason, have you not, to suppose that during the last year there was no cattle plague in Germany?—We believe not.

717. Or in 1875?—Two outbreaks were reported in 1875.

718. Or in 1874?—As to 1874, I am not quite certain; I believe there was no outbreak in 1874.

719. With that information which you obtain, which is now under very much better organisation in consequence of the international arrangement, does it not strike you that it would be rather unreasonable to stop this large import into London in years when there was no cattle plague whatever in Germany?—Excepting that in each case when cattle plague has broken out in Germany the information has reached us too late to make it available.

720. Not too late for you to take the restrictive measures?—Not too late for us to take restrictive measures when it was in this country.

721. I suppose you would admit that, both in 1872 and this year, the fact of your getting the information immensely diminished the danger that otherwise would have occurred?—Yes; but on this occasion we got the information from the newspapers.

722. How many sheep were imported into London from Germany in 1876?—Two hundred and thirty-eight thousand three hundred and eighty-three.

723. Supposing, then, that there was the same progress with regard to the necessity of restrictions as you have yourself made between 1873 and the present time, and that the recommendation was then also to stop the sheep, that would have a very great effect, would it not?—We should not stop the sheep for cattle plague, as we have not done it on this occasion; but we should simply place them in such a position that they could only be landed for slaughtering; and we find that under that restriction the number during this year has been enormously increased.

724. I am going upon the supposition that it

Mr. *W. E. Forster*—continued.

being found that cattle plague could be carried by sheep, and was conveyed to sheep, the restrictions would have to apply to sheep; then it would have a very considerable effect, would it not?—Undoubtedly.

725. With regard to Deptford, does a larger or a smaller proportion of the live cattle imported come into Deptford now than was the case two or three years ago?—I am not at this moment prepared with the figures; but I believe that during the last few months we have had a considerable number of cattle there, in consequence of Holland being scheduled.

726. It sometimes used to be stated, that although a good many of the importers thought it a very hard thing to be compelled to send their cattle to Deptford, yet that they were prepared to admit that the fluctuations and changes (the Privy Council Office having sometimes suddenly to order them to be sent there) were disadvantageous, and that it might be better to force all the cattle that came to London to go to Deptford; have you any opinion upon that matter?—I believe that it would be advantageous, in a sanitary point of view, either to send them all to Deptford, or to establish arrangements for slaughtering at Thames Haven.

727. Supposing that your proposals for restrictions as to pleuro-pneumonia and foot-and-mouth disease were carried out, you say that you would stop the breeding stock coming in from Holland?—Unless under certain restrictions, such as certificate of origin, and supervision subsequently.

728. You stated that you did not think it was wanted; why did you give that opinion?—My opinion is that store-stock is not wanted from the Continent, but I made an exception in favour of dairy-stock from Holland.

729. It finds a market here, does it not?—I believe very few store cattle are purchased.

730. Then they do not come over to any extent?—Only for dairy purposes.

731. But the 10,000 would not come unless they were wanted, would they?—I have no doubt that there is a good market for them, but I should allow those 10,000 to come, presuming that they came from healthy districts, and that I was allowed to keep them under observation for three months after they have got here.

732. With regard to fat stock from Spain and Portugal, I understand you to say that you would have different regulations from those existing at present?—I should deal with them in the same way that I should propose to deal with animals in this country.

733. Would you do the same with Denmark?—I should.

734. Do you doubt the evidence that has been given to us, that the animals that come from Denmark are exceptionally healthy?—Not at all, but we have had even recently foot-and-mouth disease introduced along with Danish animals; and I should, on that ground, if I propose to stop foot-and-mouth disease, deal with them as I should with animals from Spain, where foot-and-mouth disease only prevails occasionally.

735. With regard to foot-and-mouth disease being introduced from Denmark, do you recollect when it was introduced?—About the last day of February this year there was a cargo, among which there were seven animals affected with the disease.

736. What is the present Order in force with

Professor *Brown.*

15 May 1877.

Professor *Brown.*

15 May 1877.

Mr. *W. E. Forster*—continued.

regard to foot-and-mouth disease; if one beast is found with it in a cargo, are all the rest of the cargo slaughtered or not?—All the cargo, cattle, sheep, and swine, are slaughtered.

737. That is a restriction of a severity entirely beyond that which applies to home cattle, is it not?—Certainly.

738. Or to Irish cattle?—Or to Irish cattle.

739. In the case of a cargo that comes from Denmark, or from Hamburg, having one animal with foot-and-mouth disease, all the rest of the beasts are slaughtered?—Yes, and the sheep and the swine as well.

740. In the case of a cargo that comes from Ireland, in which there may be 500 animals, and 200 have got the disease, what becomes of the other 300?—They would be sent about as if they had nothing the matter with them.

741. In the case of a drove going into the Islington Market, if half of them are found to have foot-and-mouth disease, what becomes of the others?—The others would be sold and taken away, just as if they were perfectly healthy.

742. Therefore, as far as regards any infectious animal that comes from abroad, the present regulation is far stronger to prevent the infection being spread than it is as regards any animal that comes either from Ireland, or from the provinces, into London?—Decidedly.

Mr. *Wilbraham Egerton.*

743. You have spoken of international engagements; can you tell us what progress has been made since the report of 1875, in which you state that "It is now hoped that arrangements of a similar nature" (to those which had been adopted at the Vienna Conference) "will be soon completed with most of the other countries represented at that conference"?—We have completed arrangements with Austria and Italy, and also with Germany and Russia; I am not aware that there are any other countries with which arrangements have been completed.

744. Have you any arrangement with Holland?—We have arrangements with Holland chiefly relating to the importation into that country; they agreed to prohibit the entrance of stock from other countries, so long as we allowed them to remain out of the schedule.

745. That is an international agreement?—Yes.

746. At the present time they are allowing sheep to come through Holland into this country for slaughter, are they not, with the knowledge, as I understand, of the Privy Council?—No, we have no power to prevent it. As we put them in the schedule, they said, "We may as well now let animals go through our country;" and the only answer they got was, "You must do as you think best."

747. It is very important that we should draw, if possible, supplies of live animals from Holland, is it not?—For dairy purposes.

748. And also for meat, is it not?—I propose to get the meat by slaughtering the fat stock at the port of landing in this country.

749. As far as cattle plague is concerned, the arrangements that are now made in Holland are such as would keep out all animals coming from countries south and east of it, are they not?—They are, when the arrangements are in full action; that is to say, when Holland is out of the schedule.

Mr. *Wilbraham Egerton*—continued.

750. Therefore you would propose to put Holland into the schedule, in consequence of its danger from pleuro-pneumonia, rather than of its danger from cattle plague?—Yes, solely on that account.

751. Do any sheep come from Russia now?—Very rarely.

752. Still they are allowed, are they not?—If they do not come with cattle, and are landed in defined parts of the ports.

753. Will you state what difference there has been since the Committee of 1873 with regard to the ports which have scheduled and unscheduled cattle together in the same or contiguous markets?—Since the report of 1873, several ports have been struck out altogether; that is to say, Bristol, Cardiff, Dartmouth, Dover, Folkestone, Grangemouth, Littlehampton, Penzance, South Shields, and Shoreham.

754. Is that since the report of 1876?—Some of them have been struck out since the report of 1876, and some of them before.

755. From the report of 1876 I see that there are 30 ports in which foreign animals might be landed, and in only 13 out of those are there parts defined for the landing and slaughter of cattle from scheduled countries; is that so?—That number has been since reduced.

756. How many are there in the latter category?—We have struck out the defined part at Glasgow, the defined part at Littlehampton, and the defined part at North Shields and Newcastle-upon-Tyne.

757. Do you think it is desirable that there should exist any port where the scheduled and unscheduled cattle should be placed together in the same or contiguous market?—Supposing that the scheduled countries remain as they were before the last outbreak of cattle plague, it appears to be desirable not to allow animals from the two sets of countries to be landed in the same port, unless the landing places are kept quite distinct.

758. Has that recommendation in the report of 1873 been thoroughly or particularly carried out in which it says, "That the Privy Council, in exercising the power conferred upon them by Part III. of the English Act, should limit the ports at which foreign animals are allowed to be landed to those at which satisfactory provisions have been made for their lairage, isolation, and slaughter, and for the disposal of their carcases"?—It has been carried out to a considerable extent.

759. To the extent that you have just mentioned?—To the extent I have just mentioned.

760. Do you think that it ought to be carried still further?—The recommendation is, I may say, still being carried out; we are still in correspondence with the authorities at the ports where the regulations are not what we require.

761. When you say that it is undesirable that animals from scheduled and unscheduled countries should be herded together in the same market, are you speaking generally or with regard to any particular cases?—I am speaking with reference to cases which have come under my notice, where it would have been almost impossible to prevent the animals being mixed together after landing, except by such precautions as could be taken by persons, there being no effectual barrier between the two landing-places, one for

Mr. *Wilbraham Egerton*—continued.

for the scheduled and the other for the unscheduled animals.

762. I understand you to say that, supposing your extreme regulations could not be carried out, you think that still further stringency in the regulations with regard to ports should be adopted, in order to prevent the risk of animals coming from scheduled countries and unscheduled countries being placed together?—I do.

763. Do you think that the cattle plague, immediately it breaks out, should be treated by the Privy Council in the same way as it is now?—Certainly, if it is desired to get rid of it without loss of time, and at the least possible expense.

764. I understand you to advocate uniformity of action by means of Government inspection; is it not so?—It is.

765. Is that under the present system or under your extreme system?—My own idea is that unless we adopt an extreme system in reference to the foot-and-mouth disease we might just as well leave the whole affair alone.

766. Were you speaking in reference to foot-and-mouth disease, or in reference to diseases in animals generally, when you were speaking of Government inspectors all over the country?—I was speaking in reference mainly to foot-and-mouth disease and pleuro-pneumonia.

767. Would you propose in each county to have a chief inspector?—Some such arrangement as that must be necessary; some one must be there to be in constant communication with the office, and to take his instructions from us.

768. As the matter stands at present, in many countries the chief inspector is appointed by the quarter sessions, and he is governed by a committee appointed by the quarter sessions; do you propose entirely to supersede that officer, and to vest the power which he possesses in a Government officer with instructions from the central office in London?—I should do so, and I should take care that that officer was a person competent to advise npon the sanitary question, which the chief inspector is not now usually competent to advise about, because it is usually the chief constable, or some gentleman in that position, who is not presumed to have any professional knowledge.

769. I understood you to say that you thought the cost of this arrangement would not be very much greater than the cost of the present one, as at present the inspectors are paid by the local authority; but you propose that these inspectors should still be paid by the local authority?—I should presume so. I apprehend that the Treasury would not undertake the payment of 2,000 inspectors in the country.

770. Do you think that the local authority would submit to have to pay inspectors who were entirely Government officers, who were not at all under their control, instead of, as at present, having officers entirely under their control, who are paid for by the country?—I think it is quite likely that there would be a difficulty upon that score.

771. Then do I correctly understand you to say that that is merely your suggestion, as what you think the best thing to be done?—Quite so.

772. You do not say whether such a course will be acceptable to the country generally?—No; dealing with the question of cattle plague in the way that I should deal with it, I am afraid that I should act very much like a general I

Mr. *Wilbraham Egerton*—continued.

lately read of, who was told that his proceedings in stamping out something objectionable would cause a revolution, and he said he should stamp out the revolution also. I have mentioned to the Committee before that in all financial matters I do not presume to have any opinion whatever; I simply order the thing to be done, and leave somebody else to pay for it.

773. As you say that you believe that the farmers are not prepared to submit to such restrictions as you propose, is your proposal really a serious proposal, or is it only an alternative proposal?—So far as I can understand my own feelings in the matter, it is purely an alternative proposal.

774. I want to ask you not what you think ought to be done, but what you think can be done; if your extreme proposal cannot be carried out, what is the proposal which you think can be carried out, with your knowledge of the country, and of the prejudices, perhaps, that farmers may have against any such interference as you propose? First of all, with regard to the cattle plague, do you think that the measures that you would require to prevent the introduction of cattle plague into this country would also, to a certain extent, be sufficient to prevent the introduction of a great many other diseases which are now complained of, and, therefore, could you treat the question simply as a question of keeping out cattle plague?—I think that the means of keeping out cattle plague would not very considerably influence the introduction of other diseases, because, in reference to foot-and-mouth disease, the present restrictions are of such a nature as to prevent the escape of infected animals generally; it is only occasionally that we get the disease into the country in that way. In reference to pleuro-pneumonia, we very rarely get it from Germany, the country whence we get cattle plague; and, therefore, on that score I do not apprehend that cattle-plague restrictions would materially influence either of the other diseases.

775. I understand your view to be rather contrary to the opinion of many agriculturists, that these diseases are not introduced by foreign animals into England except occasionally, and that the foreign animals form no material element in the spread of the two diseases, pleuro-pneumonia and foot-and-mouth disease, as is imagined generally?—That is my conviction.

776. With regard to cattle plague, supposing that you took measures to slaughter all animals either at the port of embarkation or at the port of debarkation, as you do now in the case of cattle from scheduled countries, that would give an immunity from cattle plague?—Slaughtering at the port of embarkation would, but not slaughtering at the port of debarkation, without some other arrangements which would give us power to prevent the conveyance of the disease by mediate contagion.

777. What has been the effect of the present Orders upon the price of meat since the outbreak of cattle plague?—I should not think that the Orders that have been issued in the last three months have had any effect upon the price of meat.

778. In the previous Committee, I think it was stated that the slaughter at British ports had rather lowered the price?—That was in 1865 and 1866. It was found on inquiry, which was made

Professor *Brown.*

15 May 1877.

Mr. *Wilbraham Egerton*—continued.

in Manchester and other large towns, that during the operation of the restrictive Orders the price of meat had fallen, but no connection whatever was traced between the price of meat and the Orders; the two facts were merely taken together.

779. Can you tell us whether there has been any diminution in the quantity of meat which has been brought into the port of London from the Continent?—Yes, the supply at the Metropolitan Market has fallen off very considerably.

780. In the foreign supply?—The supply from Holland, chiefly; in consequence of putting Holland in the schedule, it was not possible to send Dutch animals to the Metropolitan Market.

781. Has the supply from Germany fallen off?—We totally prohibited the introduction of live animals from Germany.

782. You say that it has fallen off in consequence of the Dutch animals not being allowed?—The supply to the Metropolitan Market has fallen off in consequence of the Dutch animals not being allowed.

783. But they go to Deptford?—They do.

784. Therefore you are merely speaking of the supply to the Metropolitan Market, and not of the supply to London?—No, the supply to London has not fallen off seriously, except so far as regards the German cattle.

785. With regard to foot-and-mouth disease, you do not approve of any restrictions being carried out, such as have been carried out for the last few years, since the Order of the Privy Council of 1874 was renewed?—I do not find that any particular benefit arises. I am able to prophecy when a new accession of disease will occur, and to be right within a week, without reference to the Orders, and without regard to the importation of foreign cattle.

786. From time to time the foot-and-mouth disease has disappeared altogether from this country, has it not?—Not since it was introduced in 1839.

787. It has disappeared in certain parts of the country, has it not?—Yes, in certain parts of the country it has disappeared.

788. When the disease first breaks out again in any one spot, do you not think that it is advisable to limit the movement of cattle in that district?—Yes, that is the essence of the scheme which I propose.

789. That is now done by the power conferred upon the local authority formerly, and re-conferred upon them by the Order of 1874?—It is done to a very slight extent in some few districts.

790. But you are not aware that it has been unsuccessful where it has been tried?—In those few districts where it has been tried it has been successful.

791. But there have been no general Orders; it has only been partially adopted, has it?—That is so.

792. With regard to quarantine, there is an opinion that quarantine should be largely adopted for animals coming from abroad where they are not slaughtered; do you think that that could be carried out in any of our large ports?—It seems that the difficulty of establishing sufficiently extensive arrangements, and the enormous loss of property that would result when contagious disease breaks out, offer an insurmountable objection to the system altogether.

793. Evidence was given before the Trade in

Mr. *Wilbraham Egerton*—continued.

Animals Committee to the effect that in large towns like Liverpool and London, and perhaps Hull, it would be almost impossible to have proper grounds for quarantining, and that if you had them they would be only hotbeds of disease; do you agree with that opinion?—I quite agree with that idea. It seems to me impossible to establish a system of any extent which should allow you to keep cargoes sufficiently separate to make it safe to let one cargo escape while disease existed in another part of the quarantine station.

794. It was also argued before that Committee, that the objections to quarantine were, first of all, the expense; secondly, the interference with trade; and, thirdly, the deterioration of the animals during quarantine; you think that all those are objections to quarantine?—I think so.

795. Quarantine has been tried in small cases like Southampton with success, and probably it can be only tried in small cases with success?—That is my apprehension. It answers perfectly well so long as no disease breaks out, and no disease has ever happened among animals quarantined at Southampton.

796. Do you think that it would be possible to introduce dairy animals from Holland at the port of Harwich, say, with such precautions as would prevent the introduction of pleuro-pneumonia into England from those animals?—I believe the only feasible system would be the one which I suggested, viz., to get the animals from districts where no pleuro-pneumonia exists, and that could be done in Holland very easily. The state of the country is very well known to the officials. The cattle might be landed at Harwich, driven to the premises of the persons who purchased them, and kept under observation there. In that way we should have a series of quarantine stations, of which the owners of the animals themselves would be the proprietors.

797. Do you think that the farmers themselves might do much to prevent the spread of disease if they would use the ordinary precautions of quarantining their own animals after they bought them, by isolation from the rest of the herd?—Undoubtedly they might do a great deal, but as a rule it seems to me that stockowners exercise their ingenuity in every way to see how they can get disease. The London dairymen have been doing that for the last three months.

Mr. *Torr.*

798. There seems to have been some difference of opinion between the Department and your inspectors as to the nature of some of the later cases of cattle disease that have occurred in the metropolitan district; will you give the date of the last case in London, as to which you consider there is no doubt of its having been cattle plague?—The case which occurred on 1st May has certain circumstances connected with it which make it doubtful; and the outbreak in Hull on 5th May is another instance where the surrounding circumstances lead to a conclusion different from that which would be drawn from the symptoms and post-mortem appearances of the animals.

799. But I want to get the latest date at which a case occurred, as to which there is no doubt, and as to which both the Department and the inspectors are fully of one opinion that it was really

Mr. *Torr*—continued.

really a case of cattle plague?—The last case as to which I have no doubt at all, was the one which occurred in Notting Hill on the 25th of April.

800. In all the cases that have occurred since that date in the metropolitan district, there is some doubt as to whether they were really cases of cattle plague or not?—There has been only one case since, on 1st May, and that has been very generally doubted; in fact I read an article this morning in one of the papers throwing considerable doubt upon the matter.

801. What do you consider to be the last case in Hull as to which there is no doubt?—In reference to the last case, near the Paragon Station, on the 22nd of March, I have no evidence at all; therefore I have a right to take that as a case about which there is no doubt; it has not been questioned that I am aware of. I should say that 22nd of March is the date of the last case in Hull, about which there is no doubt.

802. With regard to these 2,000 inspectors, is it part of your scheme that they should all be appointed by the Department in London, and that they should all be in communication with the Department in London?—I should not absolutely insist on their appointment by the Department, but the Department should have a right to object to the appointment of any inspector who was not considered to be competent; I think that the appointment should either be made or confirmed by the Department, and certainly in the case of all the head inspectors, they should be in communication with the central authority.

Mr. *Assheton*.

803. I wish to ask you what has led you to modify your opinion as to the contagious nature of foot-and-mouth disease so very much since you gave your evidence in 1873?—I do not think that I have altered my opinion at all.

804. The two opinions seem so very different, that either I have made a mistake or you have made a mistake. In the evidence before the Committee of 1873, at Question 2524 you were asked, "But with regard to the foot-and-mouth disease, I believe that is very easily transmitted without the contact of animals;" and your answer is: "Undoubtedly; by the mere conveyance of a small quantity of the saliva." Then the next question is: "If you were to take a lock of hay out of the mouth of a diseased bullock, do you think it would be possible to go 200 miles and infect another bullock with it?" and your answer is: "I should think very possibly indeed. I have done it at a shorter distance;" then the next question is: "Have you successfully done it?" and your answer is, "Successfully;" since that time you seem to have altered your opinion a good deal; at Question 44 in your examination on Friday, you were asked this: "You mean that the evidence does not show that foot-and-mouth disease is contagious in that way?" and you reply, "It does not show that it is conveyed by mediate contagion in the same way as cattle plague is;" then in answer to Question 46 you wind up by saying: "So that while I admit that foot-and-mouth disease may be conveyed by mediate contagion, I contend that the risk, as compared with cattle plague, is exceedingly slight"?—Yes, that is my impression; indeed, I may say that that is the fact in reference to the conveyance of

Mr. *Assheton*—continued.

foot-and-mouth disease by mediate contagion, but it is not so readily conveyed as cattle plague is.

805. So that in that respect you have altered your opinion from what it was in 1873?—No, what I stated in 1873 was a fact; that if you take hay from the mouth of a diseased animal and transmit it to the mouth of a healthy one, as a rule, you give the disease. I have not done it since, but I have no doubt that I could do it to-morrow with the greatest certainty; it has been done hundreds of times. But my meaning is that while the landing of cattle-plague animals in this country is almost certain to be followed by the transmission of disease by mediate contagion, foot-and-mouth disease is not so readily conveyed.

806. Holding that view, I do not quite see how you can account for the very rapid spread of foot-and-mouth disease?—Chiefly by the movement of diseased and infected animals dropping their saliva about the roads and on the pastures.

807. You admit the mediate contagion then?—Yes, I assert it. The only doubt that has ever been thrown upon the matter was in the experiments of Mr. Duguid, who certainly failed for some months to produce it by the saliva and other products of diseased animals taken from foreign beasts at Deptford; but as soon as it broke out in the Metropolitan Market, and he got some of the English virus, he did it with the greatest ease. I cannot explain it, I merely state the fact.

808. Are you aware that the popular opinion amongst farmers is that it is an exceedingly catching disease?—It is one of the most highly contagious diseases which exist amongst animals; I should say that it stands second only to cattle plague.

Mr. *James Corry*.

809. Am I correct in assuming that your evidence to the Committee amounts to this: that you have a plan which you believe in time would stamp out the various diseases which affect cattle; but that you do not think that the country would submit to it?—That is my impression.

Mr. *Jacob Bright*.

810. You have spoken a good deal about your power to stamp out cattle diseases, in case Parliament were to give you the power; you have asserted that it is possible to do it?—I believe it is.

811. When you speak of stamping out cattle diseases, do you mean that they would be stamped out for ever, or would you have to go on stamping them out?—Judging from the history of these diseases, it would be very difficult to prevent their re-introduction occasionally; but in such circumstances we should of course stamp them out much more readily.

812. When you speak of their re-introduction, do you mean their introduction from abroad, or their originating here or anywhere?—I mean re-introduction from abroad.

813. Do you assume that it is impossible that they could originate here?—So far as one can judge from the evidence, there is no such possibility existing.

814. Do you consider that the diseases existed in this country before they were brought by imported cattle?—That has never been explained clearly, but the probability is that the foot-and-mouth disease was introduced by surplus ships' stores which were commonly brought to this

Professor *Brown.*

15 May 1877.

Mr. *Jacob Bright*—continued.

country; and it is asserted that pleuro-pneumonia was introduced into the neighbourhood of Cork by cows that were brought from Holland, and smuggled in.

815. Are there not in this country, with regard to animals as with regard to men, many conditions which are unfavourable to health?—Undoubtedly.

816. Would those conditions which are unfavourable to health in this country ever breed disease if you had a wall round the whole island?—None of the diseases which are developed spontaneously in this country ever spread to any extent through the medium of contagion.

817. You admitted that in 1839 and 1840 we had foot-and-mouth disease and pleuro-pneumonia in this country?—We had.

818. Is it not also admitted that we had cattle plague itself many years ago?—There is no doubt that we had a very fatal disease resembling cattle plague in the latter part of the last century.

819. Is it a mere assumption to say that these diseases came from abroad; can anybody prove that they did not arise in this country?—It is possibly not capable of absolute demonstration, but there is the fact that these diseases always had a prior existence on the Continent before they reached us, and that, so far as we can ascertain, none of them have ever been developed in this country unless they had been so introduced.

820. With regard to foot-and-mouth disease and pleuro-pneumonia, I understand you to say that unless the restrictions are equal with regard to cattle coming from Ireland, with regard to cattle moving about in this country, and with regard to cattle being imported from abroad, it is folly to suppose that we shall do much in the way of diminishing disease?—I think the experience of the last 10 years proves that we do little or nothing. I have no faith at all unless some such severe system as I suggest is adopted.

821. On the other hand, you do not believe that you will ever see that severe system adopted?—I do not.

822. That being the case, would you very much lessen the restrictions which now exist with regard to the importation of animals?—No, I should make it as certain as possible that we had no more cattle plague. So far as pleuro-pneumonia and foot-and-mouth disease are concerned, I should merely schedule Holland until Holland was quite free, and I should detain animals from unscheduled countries for 24 hours at the landing place instead of 12 hours.

823. Why would you have more restrictions with regard to foot-and-mouth disease and pleuro-pneumonia or cattle coming from abroad, than on cattle coming from Ireland?—I do not apprehend that we could possibly deal with Ireland otherwise than as part of the United Kingdom.

824. Then why would you have more restrictions upon cattle coming from abroad than on cattle moving in this country, if you say that it is useless?—So far as stamping out the disease is concerned it is useless. We should diminish it to the extent of every case that we slaughtered at the landing place, and the longer we detain the animals the greater chance we have of detecting the disease.

825. You think then that it is a right thing if one cow gets foot-and-mouth disease coming across the Channel to kill every one of the cattle on board, and all the sheep and all the goats, and, in fact, all the animals?—On the principle that if we let them go we certainly introduce large numbers of fresh centres of infection, because the majority of those animals will have the disease in the course of the next week or 10 days.

826. At the same time in the very country in which they are landed the cattle are moving about without any restrictions whatever?—Yes, that is an inconsistency which is apparent.

827. Is it not ten years since we had the cattle plague?—The last outbreak occurred in 1872.

828. Then we had it in 1867, had we not?—We had it from 1865 to 1867.

829. Then after 1867, when did it occur again?—We had no further outbreak until 1872.

830. Then for five years we had been free?—We had.

831. And we have the cattle plague now, and it has cost us 10,000 *l.*?—I may have to alter the figures considerably, but I judge at this moment, speaking roughly, that it has cost us from 10,000 *l.* to 12,000 *l.*

832. Does not that show that your present system of restrictions, and your means of interfering with this cattle plague, are very considerable and successful?—It does.

833. If you have only lost 10,000 *l.* in five years it is just possible that you may go another five years and not lose more than 10,000 *l.*, is it not?—I think it is quite probable, but at the same time the loss does not include the immense amount of damage done to the trade of the country from the alarm which is occasioned, and from the very oppressive restrictions which have to be enforced.

834. Still from the fact that you may every few years have an attack of this kind, which you admit that you are generally able to deal with, you would shut out the cattle of German altogether?—For the purpose of restoring the confidence which certainly is now lost all over the country.

835. You would not admit the cattle of Germany even to be slaughtered at the place of landing?—No, because that system has entirely failed.

836. Still you say that they are extremely strict in Germany in regard to their cattle; you said, did you not, that Germany had severer regulations than any that we have in this country, or than any that would be submitted to in this country?—Far more severe.

837. Then, might it not be expected that, generally, those restrictions would succeed?—Yes, but they have not succeeded in protecting us from cattle plague three times in 12 years.

838. There were several consecutive years when we had no disease from Germany, were there not?—No disease but foot-and-mouth disease; we have always had that.

839. Then, how would you propose to make it impossible to import any cattle from Germany?—I do not apprehend that the conditions will ever be materially changed; Germany will always be liable to incursions of cattle plague on her eastern frontier.

840. Then you look forward to shutting out the cattle of Germany for a very long period?—Yes, with the probable result that some proportion of the meat which we thereby lose would be sent to us in the form of dead meat.

841. Would you shut out the sheep of Germany?—I should allow the sheep to be landed for slaughter as we are doing now.

842. I understood

Mr. *Jacob Bright*—continued.

842. I understood you to say that sheep do not convey the cattle disease?—If they come in contact with diseased cattle they may convey it, and sometimes they take it; they take it readily by inoculation.

843. We have had a great many Merino sheep, I think, from Germany in the northern towns, have we not?—Yes.

844. It would be of some consequence, of course, that they should come, if possible?—Undoubtedly it is a matter of some consequence.

845. You recommend that cattle should be shut out, lest we may possibly have the cattle plague; but I understood you to say that dead meat would have to be shut out if it came from a country where there was any suspicion of cattle plague?—I should certainly prohibit the importation of dead meat from a country where I knew cattle plague to exist.

846. Should we have any advantage at all by changing from live cattle to dead meat if both are liable to be shut out in case there is cattle plague in the country?—The chief advantage would be that the risk during the time would be very materially diminished, as the danger of conveying the disease by dead meat is very much less than the danger of conveying it by means of live animals.

847. In what way is the danger less?—In the first place there is very little risk of the meat coming in contact with cattle.

848. But you tell us that the cattle get the disease from human beings moving about amongst them; therefore, if men were in contact with this meat, and were handling it every day, they might go and give the disease?—Yes; but the history of the disease proves that the risk is so slight that it would be hardly worth taking into account.

849. Still you will admit that those who have been trying to persuade the country to shut out cattle, and have only dead meat, will have a hard task in convincing the country now that it is admitted that we may have to shut out the meat as well?—Probably they will, so far as those countries are concerned in which cattle plague exists.

Sir *Rainald Knightley*.

850. I understand you to say that there is, comparatively speaking, very little danger of dead meat conveying the disease, as compared with movement amongst the cattle?—Very little indeed judging from all the facts which have transpired in the history of the disease.

851. Have you ever known any case in which cattle plague has broken out for the first time in the interior of England?—We have had no instance of an outbreak in the interior except from the movement of animals that have been landed on the coast.

852. Therefore, as far as it is possible to form a presumption, there is no indigenous cattle disease in England; but it is almost invariably imported from abroad?—Certainly, invariably.

853. I do not quite understand your proposal to exclude the cattle from Germany and to admit them from Schleswig-Holstein; is there any cattle plague in Schleswig-Holstein?—There is none now.

854. But Holstein and part of Schleswig is a part of Germany, is it not?—Both the provinces now belong to Germany, but they make strict regulations to prevent the crossing of German cattle, because they always apprehend the possibility of cattle plague being so introduced, and the larger part of their stock is drawn from Denmark.

Sir *Rainald Knightley*—continued.

855. Have they different regulations in Holstein from what they have in the rest of Germany?—Certainly.

856. Do you know what is the amount of cattle imported from Schleswig-Holstein to England?—Last year it was something like 50,000 head, I believe.

Mr. *Elliot*.

857. Can you tell the Committee what was the cost to the country of the last great outbreak of cattle plague in slaughtered meat and regulations, and one thing and another?—I am not aware that we have any good estimate of the actual cost, but I know that the losses amounted to something like one-third of a million of cattle that were actually destroyed in consequence of the disease.

Chairman.

858. Was that in 1865–7?—Yes.

Mr. *Elliot*.

859. How much would you put that at in money in round numbers?—I should hardly be able to give a reasonable idea at this moment; it has been estimated at several millions.

860. I have heard it estimated at something like 13,000,000 *l*.?—Something of that kind.

861. By your scheme you propose to stop the importation into Ireland, and by that means to try and put down pleuro-pneumonia, and foot-and-mouth disease?—Yes; because it is most important for this country that Ireland should be free from disease, as we obtain so large a quantity of our store stock from there.

Mr. *Ritchie*.

862. I understood you to say that if your idea of prohibiting the importation of live stock from Germany were carried out, the probability is that it would raise the price of meat?—I think there is no doubt at all that it would raise the price of meat.

863. And I understood you to give as your reason for advocating such a principle in years when no cattle plague existed, that it was so difficult to get information of the outbreak?—It is difficult to get information in time to enable us to stop the importation from Germany.

864. Is that your only reason for advocating that no live stock should be permitted to come from Germany during those years in which no cattle plague exists?—I think I may say that, so far as I can see at this moment, that is the only valid reason; because if we could always know when the disease broke out in Germany we should, on the instant, prohibit imports during the time it existed.

865. You have stated already that the first intimation that you had of the importation of diseased animals which caused the present outbreak was after they were being landed here?—Two hours after they were landed we had the official information from Germany of the existence of cattle plague in Hamburg.

866. I understand from your answer that some of those cattle were actually dying of the disease when

Professor *Brown.*

15 May 1877.

Mr. *Ritchie*—continued.

when they arrived here?—One died immediately that it was taken out of the ship, on the shoot.

867. Do you think that the disease could have been detected in those animals at the time they were embarked?—I should say that a careful inspection of the animals must have led to the detection of the disease.

868. Have you ever considered whether it would be possible to have any kind of inspection at the port of embarkation?—I do not think that any inspection that could be made on the landing-place at the port of embarkation would be sufficient to protect us from cattle plague, because it must include an examination by the aid of the thermometer, and it is almost impossible that in the hurry of shipping animals any such examination could be made.

869. I find at Question 1114 of the previous inquiry, that Mr. Alexander Williams is asked in reference to this: "Where would you recommend it" (that is the inspection) "to take place; at the port of embarkation or debarkation?" And he answers: "I think a very small amount of money expended at the port of embarkation would produce a greater result than a larger amount at the port of debarkation or landing;" do you agree with that?—I do not.

870. You say that you do not think that any inspection on the landing-place would be sufficient; where do you think that the inspection ought to take place to be efficient?—I cannot imagine that we should place any reliance upon inspection unless it is conducted by our own inspectors some time after the animals have been landed in this country.

871. But I understood you to say that this very cargo which brought the cattle plague into the country, would certainly have been detected if there had been any inspection at the port of embarkation?—I have no doubt that it would.

872. Therefore if there had been anyone there representing us, whose duty it was to inspect the cattle, the disease would have been detected, and its importation would have been prevented?—In that case the inspector must have had access to the premises where the cattle were standing before they were shipped.

873. You do not think that by a mere examination of animals at the wharf he would have been able to detect the presence of this disease?—If it had been known that an inspector was on the wharf waiting for those animals, they certainly would not have been sent; but under such conditions the exporters would take care to remove all the diseased animals, and only send those which had been herded with them, which in all probability would give no evidence of disease perhaps for a day or two after they were shipped.

Mr. *Ritchie*—continued.

874. Then you cannot suggest, with regard to the question of inspecting animals before they are shipped, any means which strike you as being accessible, by which the shipment of diseased animals could be prevented?—I am afraid that it would be very difficult for us to make any arrangements with foreign governments by which we should obtain what would practically be control of the animals before they were shipped.

875. Does your difficulty simply lie in the difficulty of making such arrangements with foreign governments?—It would lie in making such arrangements as would enable our inspectors to visit the premises where the animals were kept before they were shipped, and in making such further arrangements as would enable them to identify those animals that had passed their inspection when they were shipped.

876. But if such arrangements could be made, do you think that it would be advisable?—I think that it would be advisable, but the cost and difficulty would be very great.

877. Which would be the greater cost to the consumers here, the prohibition of all importation of animals from Germany, or the efficient inspection at the port of embarkation?—Certainly efficient inspection would be less costly if it could be carried out with the same results.

878. I think I understood that you had modified your opinion as to the symptoms of disease, and that you admit that you yourself have condemned animals as labouring under cattle plague which you now know were not suffering from cattle plague?—I have.

879. I think you stated that the last so-called outbreak at Hull ten days ago was not real cattle plague?—No; I merely said that the collateral evidence is opposed to the evidence obtained from an examination of the animals.

880. And that you yourself would be disposed therefore to think that it was not a case of real cattle plague?—At this distance of time I should; but if I had been compelled to give an opinion upon an examination of the animals, and the post-mortem appearances, I should have felt bound to do as Mr. Duguid did.

Thursday, 17th May 1877.

MEMBERS PRESENT:

Major Allen.
Mr. Assheton.
Mr. Jacob Bright.
Mr. Chamberlain.
Mr. Chaplin.
Sir George Jenkinson.
Colonel Kingscote.
Sir Rainald Knightley.
Mr. Norwood.
Mr. Arthur Peel.
Sir Henry Selwin Ibbetson.
Mr. Torr.

SIR HENRY SELWIN IBBETSON, BART., IN THE CHAIR.

Professor GEORGE THOMAS BROWN, re-called; and further Examined.

Sir *George Jenkinson.*

881. In your evidence on the first day you mentioned one case in North London which you had considered, in the first instance, as a very doubtful case, many of the symptoms being very much of the cattle plague order; but you said that you came to the conclusion, finally, that it was not cattle plague; could you state what was the disease of which the animal died?—In the case referred to in North London, the animal was evidently suffering from what is known as gastro-enteritis, an inflammation of the stomach and intestines. I did not see the post-mortem examination, but Professor Simonds was kind enough to do so, and, as he will be examined, probably he will give you a more exact account than I have.

882. That is somewhat of the same nature as enteric or typoid fever with human beings, is it not?—No; it is quite distinct from typhoid fever in the human being. In that disease there is a distinct morbid condition of the intestinal glands; but in this disease in cattle, the intestinal glands are in no way implicated.

883. But you were satisfied that it was not cattle plague, although the symptoms resembled it in many particulars?—I was inclined to suspect that it was not cattle plague, from the conditions generally; and the history of the case has convinced me that it could not have been cattle plague, because the other animals still remain in perfect health. That is since 1st May, which is now nearly 18 days since.

884. With regard to the safety to be obtained from the non-importation of live cattle, is it not the fact that Ireland prohibits all importation of live stock from anywhere during the prevalence of cattle plague?—I believe it is.

885. Has not Ireland always remained entirely free from cattle plague?—Cattle plague was introduced in 1866 into the district of Drumra, in the north of Ireland. I saw a considerable number of animals there suffering from the disease, and I remained some six weeks in the country, making investigations respecting it; so that, in that instance, the disease was introduced notwithstanding the prohibition of the importation from this country.

Sir *George Jenkinson*—continued.

886. Did it spread, or was it stamped out?—It appeared first in the north of Ireland, and it was subsequently in some way carried into the Midland Counties, in the Enfield district, shortly after it had ceased in the north. Its means of transit there were not traced exactly.

887. But it did not spread all over Ireland, did it?—It did not; chiefly in consequence of the very prompt and energetic action of the Irish Government; they adopted restrictions which were continental in their severity.

888. And you attribute the non-spreading of it to those very stringent regulations, and also to the non-importation of cattle from that time?—Undoubtedly.

889. Does not that impress you with a very strong sense of the necessity for non-importation of foreign live stock into this country, at all events during the prevalence of cattle plague?—I have no doubt of the absolute necessity of prohibiting imports of cattle from countries while cattle plague exists there.

890. Is it not safer to prohibit importation from all foreign countries, at all events during the prevalence of cattle plague?—I should conclude that countries which border on those in which cattle plague exists would adopt the most severe measures for their own protection; and the history of the last century proves that those measures have been successful in reference to those countries which in my scheme I should propose to leave out of the schedule.

891. In an answer which you gave the other day to a question put to you by the right honourable gentleman the Member for Bradford, you seemed to be of opinion that the amount of importation of live stock bore a very great proportion to the requirements of London; I think you said that 55,328 were imported into London from Germany, and he rather seemed to infer that that amount was necessary for the provision-producing power of London. In estimating the total number of live stock stopped from the London port, if the importation of cattle was prohibited, have you ever made any deduction for the existing live stock which would be saved from disease and death, and slaughter, to say nothing of the pre-

Professor *Brown.*
17 May 1877

Professor *Brown.*

17 May 1877.

Sir *George Jenkinson*—continued.

vention of losses to owners of stock if we did not import disease?—I have not made any such estimate, because I do not recognise any evidence that the losses which are said to occur were directly referable to the importation of live animals. I admit the losses, but I contend that those losses arise from the circumstance that the two diseases which are chiefly complained of, viz., foot-and-mouth disease and pleuro-pneumonia, which entered the country before live stock importation was permitted, have continued ever since, and have been allowed to spread over the country without any interference.

892. I was referring in my question to the losses from cattle plague?—In reference to cattle plague there is no doubt that those losses are directly traceable to the importation of cattle from Germany or Russia, and from those countries only.

893. Possibly my question was not quite clear; I do not think that you have answered the point which I wished to put, which is, that if we lost the quantity of meat which is assumed to be imported, viz., 55,000 live stock from Germany, should we not, on the other hand, gain very much by not having losses either in money or in meat, owing to the introduction of disease; I will illustrate it by the enormous losses which occurred in 1865 to 1867 in Cheshire, which I think you yourself put at one-third of a million head of stock, and a great many millions of money?—The total losses all over the country during that outbreak may be roughly stated at something like one-third of a million of cattle. The money loss I am not prepared to give, but I think it has been estimated at something like 5,000,000 *l.* We get no return from local authorities as to the cost of dealing with an outbreak of the kind, but I believe the estimate was something like 5,000,000 *l.*

894. There is no doubt, is there, that in those years, the cattle plague was originally introduced from abroad?—There is no doubt at all.

895. And all that enormous amount of losses both in number of animals and in money value would have been saved if we had not imported that disease?—Undoubtedly it would, but it would also have been to a large extent saved, if instead of trying experiments in the mode of treatment when the disease did appear, we had adopted the continental system which had been in use for at least a century, and stamped out the disease as we have done on those occasions when it has appeared in this country since that time.

896. I think you spoke, in answer to the right honourable Member the other day, of the price of meat going up considerably, if we stop the importation of live stock?—I apprehend that that would be the case.

897. Then in a subsequent part of your evidence you said that the price of meat has not at present gone up, but that if anything, it has rather fallen; I take it that that is due to the fact that we have stopped the importation of live stock to London since the present outbreak; is not that so?—We stopped the importation of live cattle from Germany and Belgium at a period of the year when very few cattle come, so that the loss on that score has been exceedingly trifling.

898. But as a matter of fact during this outbreak we have stopped the importation of cattle, and the price of meat has not gone up?—We have stopped the importation from Germany and Belgium only.

Sir *George Jenkinson*—continued.

899. But that is the locality from which we have usually imported live stock, is it not?—Not during this season. The season during which the importation has been stopped has been one during which we get scarcely any animals from Germany; the real trade does not commence until the Schleswig-Holstein cattle come, namely, in the summer.

900. According to the Blue Book, the German supply is 55,328 against 6,200, which is the highest figure that I see from any other country; the number reported from Denmark is about 33,000 I think?—The importation placed under the head of "Germany" includes the cattle from Schleswig and Holstein, from which places we get our largest supplies.

901. With regard to the present import, have you seen a Return which I moved for, and which was issued yesterday morning from your department?—Yes.

902. By this Return, it appears that since the present outbreak there have been something like 45 separate cases, 34 have died, 214 have been killed, sick, and 835 have been slaughtered supposed to be sound, making a total of 1,083. If we had not imported the disease, that would have been saved, would it not?—It would, undoubtedly.

903. And we have not tampered with the disease in this case, as you intimated had been done in the former case?—We did not get rid of it so quickly as we might have done, if we had had larger powers to deal with it, when it was first discovered.

904. But we have stamped it out by immediate slaughter in every case during the present outbreak, have we not?—We have.

905. Do you not think that if that had been saved, it would have been a considerable gain to the community, the consumers?—Undoubtedly it would.

906. Especially in the way of milk, because by this Return I see that nearly the whole of the animals attacked are dairy cows?—Yes, that is the case.

907. Do you not consider milk a very important article of food, especially for the poorer classes, almost as much so as meat?—Undoubtedly, it is a most important article of food.

908. So that that represents a very serious loss; more so, possibly, in the case of dairy cows, than if it had been ordinary store stock?—I do not apprehend, speaking generally, that the loss has been very serious, because we have heard no complaints of a scarcity of milk; and it is rather a remarkable circumstance that, notwithstanding the prevalence of fatal diseases on certain occasions among dairy cows, nobody seems to get a less supply of milk in consequence. During 1866 and 1867 the price of milk was very much increased, but I believe that everybody got some fluid that went by the name of milk, to any extent that was required.

909. Would not that refer rather to rich people who can buy it at any price, than to poor people who at all times obtain it with great difficulty?—I believe that the price was increased first to the extent of a 1 *d.* and then 2 *d.*, which of course would be a consideration to poor persons; but the loss of a little over 1,000 dairy cows would not

Sir *George Jenkinson*—continued.

not seriously decrease the milk supply of the country.

910. What amount of money loss do you think that that number would represent?—We have no means of discovering, but on a rough estimate, I think, we might say something like 16,000*l.*

911. That is putting them at about 15*l.* per head?—At about that sum.

912. That is rather low, is it not?—Then, there is a general set-off in the way of salvage received for animals sent to the butchers.

913. You were speaking of foot-and-mouth disease just now, and there seemed to be some slight discrepancy in your former evidence which possibly might be reconciled; do you not consider that foot-and-mouth disease can be carried by other animals, such as dogs or rabbits, or birds; otherwise, how do you account for cases, such as I have known on my own estate, of a herd of young animals in the centre of the estate, with no possibility of contact with any other cattle, being attacked by the foot-and-mouth disease?—I have no doubt that it may be carried by those means, and there is reason to believe that it occasionally is so carried; but, in reference to the contagious character of the foot-and-mouth disease, I merely say that, so far as concerns its conveyance by immediate contagion, it takes a place second to cattle plague. The history of the foot-and-mouth disease goes to show that it is not generally conveyed in these ways. I may suggest as an illustration, the circumstances to which I have previously alluded, that during the last two years we have landed nearly 30,000 animals affected with foot-and-mouth disease. During those two years, commencing with the latter part of 1875, when we landed 19,000 diseased animals, foot-and-mouth diseased began to decline. During 1876, when we landed between 8,000 and 9,000 diseased animals, the disease was commonly spoken of as entirely ceased, although it did exist in the country in various places it was in such a low state of prevalence that it was really looked upon as having been extinguished. Now, if we had during those two years landed 30,000 animals affected with cattle plague, no precautions which we could possibly have adopted would have prevented the extension of that disease all over the country.

914. Are you at all acquainted with the Port of Bristol?—I am very well acquainted with that port.

915. Is it not a very significant fact with regard to the contagious nature of the foot-and-mouth disease, that during the prevalence of it, it was almost impossible to get any cattle out of or through the Port of Bristol, without their being affected with foot-and-mouth disease?—That was in consequence of animals infected with the disease being placed in the Bristol Market every market day.

916. Were they from Ireland?—From Ireland.

917. That would go to show the extremely contagious nature of the disease, would it not?—Undoubtedly it proves the disease to be contagious when healthy animals come in contact with diseased ones.

918. Would you allow animals from Ireland, or from anywhere, to be landed at any port, exclusive of Bristol or Gloucester, without any inspection whatever?—I see no fair ground for

Sir *George Jenkinson*—continued.

dealing with Ireland otherwise than as part of the United Kingdom. I could not consistently stop the importation of animals from Ireland on the plea of foot-and-mouth disease, while I allowed animals to come from Scotland and from districts where the same disease existed without the slightest interference.

919. How do they come from Scotland; by railway, or by ship?—They come in both ways, but chiefly by railway.

920. Are they subject to no inspection?—None whatever.

921. Do you not consider that to be a source of danger?—Undoubtedly; I think that the movement of diseased and infected animals from one part of the United Kingdom to another is one of the principal causes of the distribution of disease.

922. With regard to the importation of dead meat from America. I think you spoke on the first day of the state in which the meat was killed in this country, and you said that it could not be landed from America, or elsewhere, in a better state than it would be in here on the day on which it was killed?—I conclude that it would be impossible to bring meat from any distance, and land it at any given point, in better condition than the meat of an animal which was recently killed, and properly dressed in this country.

923. A great deal of the meat in this country we know is killed when the animal is very hot, and after it has been overdriven about the streets; if the animal is killed in that heated and overdriven state, the meat naturally would not be in a good condition, and, probably, would not keep; but with regard to the dead meat importation trade from America, do you not think that when people have gone to so much expense as they have for the importation of this dead meat by fitting up ships, and so on, they would take care to have the cattle conveyed to the waterside in a proper state for killing, and that they would not kill them in a state in which the meat would not be likely to keep?—I am afraid in answering that question I must flatly contradict a very popular impression which exists, about the effects of driving, that is to say, the effects of exercise upon temperature. It is a perfectly well-known fact in physiology that driving, that is to say, submitting an animal to exertion does not produce anything like an accession of temperature which would amount to fever. The effect is that it simply distributes the temperature; it makes it apparent on the surface without increasing it in the interior of the body. Further than that, butchers are always very anxious to keep the animals quiet for some hours before they are killed, and I think I am correct in stating that a prevailing custom is to keep them without food for at least 12 hours, and sometimes 24 hours, before slaughtering; and in the slaughter-houses in the north of England you see, on entering, a placard giving the prices which are charged for slaughtering including two days' use of the "hunger-house," which means the place where the animals are shut up without any food during that time; so that I am bound to conclude that, generally speaking, butchers are sufficiently acquainted with the details of their own business not to kill animals in such a condition as that they would not be likely to keep, unless on some particular emergency they are absolutely forced to do it.

924. Then

Professor *Brown.*

17 May 1877.

Sir *George Jenkinson*—continued.

924. Then I take it that your answer assumes that every precaution is taken, and that no over-driving is practised in this country?—I am satisfied that over-driving is a constant practice in this country, but I do not think that, as a rule, animals are killed immediately after they have been submitted to that unfair amount of exertion.

925. I think you spoke the other day of the great difficulty that exists in Germany, or Schleswig Holstein, in getting cattle to the waterside, and of having proper abattoirs at which the cattle could be killed before the meat was embarked; do you not think that this is a question like the level of water or the law of supply and demand in trade?—I think, as I believe, I stated in an answer to that question that the effect on the growers of cattle would be to induce them to send the cattle to the other parts where they could get a market which would pay them as well with less trouble. So long as they could get as much for the live animal as they would get if they sent it here in the shape of dead meat, they would naturally adopt the more simple course of sending their animals to Paris and Berlin and other parts of the continent where meat is very dear.

926. But the dead meat trade, being an accomplished fact, is it not likely, like all other articles of trade, to find its own level, and to be adopted and carried out where it pays, and not where it does not pay?—That is quite the view I take of it; it is simply a question of whether it would pay or not.

Colonel *Kingscote.*

927. With regard to cattle coming from Ireland and Scotland, do you think it right that cattle should come from either place on board ship, and not be inspected on arrival at the ports?—As a general principle, I do not recognise the desirability of selecting animals on board ship for inspection and excluding those that are in a railway truck.

928. Do you think that both ought to be inspected?—I do; but then that involves my scheme of dealing with the cattle traffic of the country; because, while inspection makes us acquainted with the fact of the existence of the disease, it does nothing beyond that. We are constantly made aware of the landing of diseased animals from Ireland, and we know that even if the local authorities stop the diseased animals, those that have been herded with them are allowed to go free.

929. For instance, cattle landed at Bristol have to be inspected, and those landed at Gloucester go freely throughout the country without any inspection; you consider that state of things ought not to exist?—I do not think the inspection at Bristol prevents the subsequent movement of the animals to any extent.

930. You look upon the inspection at Bristol, then, as being of no advantage?—Excepting that it gives us information as to the existence of disease, I do not see what other good purpose it can serve.

931. That would apply to Gloucester, or to any other part, I presume?—It applies to every part where the inspectors merely report the existence of disease, and are not empowered to take any action. The only advantage that I think it has, is the information which they convey to the local

Colonel *Kingscote*—continued.

authorities which those authorities may act on if they choose under the Animals Order of 1875.

932. But for the prevention of the spread of the foot-and-mouth disease, or any other disease, would it not be, in your opinion, desirable that there should be inspection, and that, coupled with that inspection, there should be authority to prevent animals being moved from the ports, or in the country where they were infected with the disease?—Certainly, and at the same time I should extend that system to the whole of the country; I should as much prevent the movement of diseased animals from a farm, or from one county to another, as I should from one landing place to the interior of the country.

933. Of course there would be more difficulty in inspecting animals carried by rail, than there would be in inspecting animals conveyed by ships; how far would you let them go without stopping them if they were on the railway?—I should rely principally upon the detection of the disease at its centres of origin, and preventing the movement of diseased animals from those centres.

934. With regard to the "Castor" as to which you gave us the account of the disease coming in from Hamburg during this last outbreak, have you seen the official document which was sent by the authorities at Hamburg to the Government at Berlin?—I have not seen any official document which was sent to Berlin.

935. In the document that was sent as a sort of official document, was it not stated that the cattle on board the "Castor" had arrived at Hamburg on the 9th of January, and that they were not inspected until the 12th by the veterinary inspector on the same day that they were put on board the "Castor"?—I have not seen that document, but from the information which I obtained otherwise, I know that that was the case.

936. Therefore it proves very distinctly that cattle can come from very many parts of Germany and even from Russia to Hamburg or to any other ports with disease upon them, which may not be found out by the inspectors, and yet the disease may break out after they have got even to this country; there is nothing to prevent those cattle that come straight from Russia being put on board the ships at Hamburg with the disease upon them, and yet the inspectors would not be able to detect the disease?—That is quite impossible if the exporter exercised ordinary care to take away diseased animals; but it ought not to have been possible in this case where some of the animals were actually dying from the disease when they shipped.

937. Had no one power at Deptford to stop the ship from going from the dock after the disease was discovered?—The disease was not discovered until after the animals had been landed, and the ship had left. I believe there was no power vested in anybody to detain the vessel, but had it been known that the animals were infected with cattle plague, I have no doubt whatever that the inspectors would have taken upon themselves to stop the ship until it was disinfected as we did when we discovered it; but the ship was gone from Deptford, and we found it at another wharf.

938. Do you know whether it was the same person who embarked the cattle on board the "Castor" that embarked the cattle that went to Hull at the same time on board the "Hansa"?—It

Colonel *Kingscote*—continued.

—It was the same firm; there are two men in it.

939. Is the inspector at Hull who did not detect the cattle plague, but who thought that it was foot-and-mouth disease, a local inspector or a Government inspector?—He is a Government inspector, and a man of very large experience?—The cattle on board the "Hansa" must have been in very much better condition than those on board the "Castor," because some of them were kept alive for four or five days, I believe, and subsequently on examining them there were no evidences which excited suspicion of the existence of the disease.

940. As regards the inspectors whom you would appoint under your scheme all over the country, if the Government took all the regulations into its own hands, would it not free the local authorities from great expense in their inspection, and would it not be really cheaper in the end, putting aside where the money is to come from, for the Government to have the inspection, so saving very often a double authority among local authorities; for instance, where boroughs and counties merge into each other?—I have no doubt that the whole cost to the country would ultimately be less on account of the advantage which would be gained in suppressing disease which is now allowed to go in any direction without any restriction. The immediate cost would undoubtedly be greater than it is now.

941. Supposing that an inspector reports diseased cattle at Bristol or anywhere else, does it not enable the local authorities to act with greater vigour if they choose?—It does. I mention that as the chief advantage in the system.

942. It strengthens their hands?—It strengthens their hands.

943. Do you consider the Act of 1869 sufficient to meet the present requirements of the country?—I do not think that its provisions are sufficiently elastic; I mean by that that there are so many cases laid down where you are bound to proceed in a certain direction quite irrespectively of the local conditions.

944. Would you advise that the Act should be amended, or that a new Act should be brought in in its stead?—I should advise that some short Act should take the place of the present Act, giving the Privy Council power to make such regulations as may be necessary in various districts.

Mr. *Arthur Peel*.

945. You regard pleuro-pneumonia and foot-and-mouth disease, I think, to use your own expression, as naturalised in this country?—I should say, considering that they have remained in this country between 30 and 40 years, and have never entirely ceased during that time, that we may speak of them as diseases of foreign origin, which have become naturalised.

946. Do you think that they would go on without any foreign supply?—My impression is that they would, and all the evidence goes to show that they would.

947. Have you formed the same opinion with regard to cattle plague?—I am quite clear that cattle plague does not appear in this country, unless it is introduced from Germany and Russia.

948. Is it known at all, scientifically, what are the predisposing causes to cattle plague?—So far as we can judge, there are no particular predisposing causes. As a matter of fact, some of the animals in the dirtiest cowsheds in London altogether escaped during the outbreak of 1865; and those in such sheds as Lord Granville's and Lady Burdett Coutts, where everything was perfect, were the earliest attacked.

Mr. *Arthur Peel*—continued.

949. I understood you to say, that dead meat was capable of conveying the disease?—Undoubtedly it is.

950. In a slighter degree, of course, than the living animal?—Much less, naturally.

951. In the case of stock in contact with diseased animals being killed, what supervision is exercised over the meat that is sent into the market from the animals so slaughtered?—During the time the local authorities were acting, I believe they allowed their inspectors to decide whether or not the animal was fit for food, and under that system we are aware that many animals in the earlier stage of the disease were considered fit for food and were sent into the market. Since the Privy Council has had to deal with cattle plague in the metropolitan police district, the inspectors have been instructed to deal with every animal as diseased which gave any indication of fever by rise of internal temperature, which would be the earliest symptom that could be observed.

952. In the case of an animal which indicated an increased temperature, would that meat be condemned?—The animal would be slaughtered and buried whole.

953. So that in no case where the disease was exhibited in the intestines, would that meat be sent into the market?—Certainly not, under that system, if the inspectors did their duty.

954. But, of course, the disease might be latent, incubating in the animal?—It might.

955. In that case, is there any reason to suppose that the meat would be unwholesome?—If we may judge from the experience of those parts of the country where cattle plague was most rife in 1865, 1866, and 1867, no harm would result from the consumption of that meat, because it is beyond all question that tons of it were consumed, and no disease among human beings was noticed as a consequence of such consumption.

956. Was it observed that the disease was communicable through the milk of an animal in which disease was incubating?—No. It was noticed, I believe, by the medical officers that there was nothing during the whole of that time which was at all special as a disease among human beings, and certainly nothing that could be traced to the consumption of diseased animals or of any of the products from them.

957. With regard to the powers required to be given to the Privy Council, I think you said that increased power was needed for the slaughter of healthy animals which had been in contact with diseased animals?—Not with regard to animals in contact with diseased animals; we have already the power to slaughter those.

958. Then you want the power to slaughter animals within a certain radius?—Within a certain radius; animals which are not in contact with diseased animals, but which have nevertheless been exposed to infection.

959. Would you limit that radius in any way?—If I were simply instructed to get rid of cattle plague at all risks and at any cost, I should prefer to have no limit at all.

960. Would not even the German limit co ntent you?

Professor *Brown.*

17 May 1877.

Mr. *Arthur Peel*—continued.

you?—I think the German limit is a very elastic one.

961. It is a mile, is it not?—Yes, in reference to the slaughter of animals I think the slaughter is very often necessary.

962. Irrespective of any radius?—Quite so.

963. Do you think that the compensation given for slaughtered animals is so inadequate as to induce secrecy on the part of the owners of diseased animals?—I stated to the Committee in 1873 that I should prefer always giving full compensation, chiefly for the purpose of inducing owners to give notice of disease. That would be my direct object.

964. I noticed in your evidence as to Hamburg that 300 cattle had been compensated for to the amount of 15,000 *l.* I suppose that is in your view altogether an extravagant system of compensation?—I do not reckon the price per head. I merely read from the official statement which I have got from a German authority, but I presume that would include all the cost. It was stated that the whole cost to the Government was 15,000 *l.*; I presume that includes such things as burning down premises and digging up floors, and burying manure, and destroying everything which they think may possibly convey the contagion.

965. You do not attach much importance to the danger arising from the manure of these diseased animals?—Supposing that it is ploughed in at once I should apprehend no risk; but we have always dealt with it as if it were the most deadly material possible; we have mixed it with its weight of quicklime and buried it, or in cases where we could not otherwise dispose of it we were compelled to send it out to sea.

966. With regard to the last recommendation of the Select Committee of 1873 as to foot-and-mouth disease, "That power should be given to the Privy Council to allow the movement, under proper precautions, of animals so affected, for slaughter, food, or shelter, inconvenience having been found to result from the absence of such power." I understood you to say that that had been carried out; but how would the Privy Council be competent to issue an Order to give themselves that power?—I alluded to the latter part of the 57th section of the Act, which provides that, "Notwithstanding anything in this section, the Privy Council may from time to time, by Order, make such further or other provision as they think expedient respecting animals becoming affected with foot-and-mouth disease, or any other contagious or infectious disease not being cattle plague, pleuro-pneumonia, sheep-pox, or glanders, while exposed, or placed, or being carried, led, or driven as aforesaid, and any such Order shall be deemed part of this section." Under that section the Privy Council passed an Order giving power to move animals that became affected during the time they were exposed in a market, while they were being driven along a public road.

967. Smithfield is exclusively a dead meat market, is it not?—Entirely.

968. When was the change made?—I forget the exact date, but it was some years ago.

Chairman.

969. It was after the Dead Meat Market Inquiry?—It was. It was merely a removal of the dead meat market from Newgate market across to the Smithfield site.

Chairman—continued.

970. Was that at the time of the setting up of the Islington market for live stock?—No, that market was set up long before the Smithfield market.

Mr. *Arthur Peel.*

971. Was the Smithfield market in substitution for the Newgate market?—I do not think that it was a substitution; it was merely a removal of the meat market which used to be on the right-hand side in Newgate-street beyond the Old Bailey, to a more commodious site. The origin of the dead meat market was before my time, I believe.

972. Whenever the dead meat trade in London was established, I suppose it has grown immensely in its proportions?—It has undoubtedly.

Major *Allen.*

973. In reference to the increase of compensation, if you give greater compensation for the slaughter of animals, of course you reduce the probability of concealment on the part of the owners of herds?—I think you do to some extent.

974. And if that compensation were given, then the Privy Council might take upon themselves still more stringent measures to restrict the movement of animals?—They might.

975. Are you aware that in Somersetshire we have adopted the most stringent rules that the Privy Council will allow us to adopt as regards the movement of animals?—I am aware of that.

Mr. *Chaplin.*

976. I gather from your evidence that upon the whole you consider that the only practical mode of dealing with cattle plague, with a view of getting rid of it in this country altogether, is to prohibit the importation of live cattle from those countries where cattle plague has been certified to exist?—From Germany, as a country which is liable to frequent incursions of the disease on the eastern frontier; and from Belgium, as a country of transit.

977. Do you mean perpetual exclusion of cattle from Germany?—Yes, if it is asserted that we are to protect ourselves, and to obtain perfect security, the only method that I see of obtaining that perfect security is to totally prohibit the importation of live cattle from Germany and Belgium. Of course Russia is always included, because we do not think of having cattle from there.

Chairman.

978. That is placing Germany and Belgium in the same position that for some years Russia has been placed in?—Yes.

Mr. *Chaplin.*

979. With regard to the dead meat trade from America, do you think that that trade is likely to continue at its present rate, or even to increase?—I only give an opinion upon that subject from what I have heard from various sources, and the impression which I get is, that the trade is likely to continue if the prices go up, but that it will not continue when the price which can be obtained in the American towns, approaches more nearly to the price which can be obtained in this country.

980. As to whether it is likely to approach that price or not in America, are you able to give an

Mr. *Chaplin*—continued.

an opinion?—I have heard it suggested that when the expected return of prosperity in the trade of those towns occurs there will be a larger demand for meat, and there will be less temptation for the exporters to send it here.

981. Assuming that it does continue at its present rate, or assuming that it increases, and that cattle plague was permanently banished from this country by prohibiting the importation of live cattle through Germany and Belgium, what, in your opinion, would be the ultimate effect upon the price of meat in this country?—The price of meat, I believe, depends very little indeed upon the supply; I imagine that it is more connected with the purchasing power, and the yearly increasing number of consumers. I apprehend that an increased supply means an increased consumption to the extent of the individual's means, and that the effect of an increase of price is to diminish consumption. I believe that cheap meat means the consumption of about twice as much meat as anybody requires, that they eat what they can get, and not what they want.

982. I understand then that you are not of opinion that to prohibit the importation of live cattle would injuriously affect the price, that is to say, would increase the price?—I have no doubt that it would increase the price at once.

983. But ultimately what would be the effect of such a prohibition?—Ultimately if an equivalent supply were obtained from any source in the shape of dead meat, it would leave prices very much as they are now.

984. I understood you to say that you drew up a memorandum suggesting alterations or additions to the regulations as to cattle plague, which ought to be adopted in consequence of the recent outbreak, and which would be attended with advantage in case of any future outbreak?—That was a memorandum which was addressed to the local authorities.

985. Would those suggestions be best carried out by the local or by the central authority?—Undoubtedly by the central authority, because the local authority is deficient in the necessary machinery.

986. Then, in the case of an outbreak, with a view of stamping it out in the speediest and the most effectual manner, you think that the Privy Council ought to supersede the local authorities in all cases?—I think that that would be the most effective and economical method of proceeding.

987. The cost, I understood you to say, would be somewhat greater?—In the first instance, the cost undoubtedly would be greater.

988. But it would be more than compensated for by the saving in cattle, I suppose?—By the saving in the number of cattle and the saving in the time during which those restrictive measures would be necessary.

989. I think you said that the loss from cattle plague in 1865 to 1867, as nearly as you were able to tell, was about one-third of a million animals?—It was in round numbers; it was over 300,000.

990. You said, did you not, that in this recent outbreak the cost to the country has been about 10,000 *l.* or 12,000 *l.*?—I stated that last time at a guess. The return which I have will show that the loss was something like 16,000 *l.*; that is, allowing 15 *l.* a head for each animal, and not deducting any salvage.

Mr. *Chaplin*—continued.

991. And that is all the loss that we have undergone in the last five years since 1872?—That is all the money loss.

992. In answer to the Member for Manchester, the last time we met, I think you said that it was possible that we might go on for another five years with only a similar loss?—I should hope to go on for at least that time without another outbreak.

993. But I suppose that it is equally possible that we might undergo as severe a loss as we did in 1865–67?—I cannot imagine the possibility of that, because, even with our present system, if the disease had shown the slightest tendency to spread to any distance, I have not the slightest doubt that the Privy Council would have stopped the movement of cattle and fairs and markets over the whole country.

994. Then you do not think that we need apprehend, under any circumstances, so severe a loss as we had before?—I should say that it is a moral impossibility.

995. There is no cattle plague in America, I understand?—There is a Texan cattle disease which is very destructive, and has very remarkable characteristics, inasmuch as the animals which give the disease to others do not appear to suffer much from it themselves. It is said to arise from the manure being dropped on the herbage along the road which those cattle take, and other cattle feeding off the same ground become fatally affected in consequence.

996. But there has been no instance of that disease being imported into this country?—No; that is a misfortune which probably is still hanging over us.

997. Then you anticipate its possibility?—I apprehend that it is possible.

998. My object in asking this question was to arrive at your opinion, as to whether it was probable at any time in the future that it might be desirable to stop the importation of dead meat from America?—I apprehend that there would be no risk of carrying this disease by means of dead meat.

999. Supposing the importation of dead meat as well as of live cattle from affected countries in Europe was prohibited, we should still be able, you think, to receive an undiminished supply of dead meat from America?—Undoubtedly.

Mr. *Norwood.*

1000. With reference to the question which has just been put to you by the honourable Member for Mid-Lincolnshire, as to the ultimate effect upon the price of meat of a continued importation from America, I did not quite understand that you had denied the broad principle, that the cost of meat would be regulated by the law of supply and demand, though you rather seemed to imply it?—So far as I can judge from what I have seen and from what I have read, the supply of meat, which must be limited, does not materially affect the cost to the consumer.

1001. You mean to say that there is sufficient consumptive demand to take off all our supplies at something like the present price?—It seems to me that the more meat a person can get the more he is likely to eat.

1002. Then you think that the agriculturists of this country have no reason to fear any serious diminution of the price of their production by a liberal import of foreign meat?—I apprehend not,

Professor *Brown.*

17 May 1877.

Mr. *Norwood*—continued.

not. I imagine that as long as people can pay for meat they will have it.

1003. Then it is not the interest of the agriculturist, you think, to restrict merely in a pecuniary, and I may say selfish, point of view the importation of meat?—I should not like to accuse them of acting from that motive.

1004. I suppose that there are large masses of our country people that really scarcely know the taste of meat?—There are undoubtedly.

1005. And it would benefit those poor creatures if they had the opportunity of eating meat?—Undoubtedly it would.

1006. I will take some answers of yours in rotation; some questions were put to you by the honourable Chairman as to the deficient arrangements which you stated to exist in certain ports, and Hull was referred to; is it not the fact that a new scheme has been submitted to and approved by your department very greatly to improve the state of things in Hull?—I admit that the proposed arrangements will improve the condition of things at Hull, but the port will still not be in a perfectly satisfactory condition.

1007. I believe that the proposed arrangement is that the present English cattle market, comprising some three acres, is to be given up to the foreign cattle, the corporation erecting slaughter-houses there, so that the foreign cattle once entering, will not be allowed to leave alive, and that the English cattle market is to be removed to a distance of a couple of miles from the landing-place for foreign cattle?—That is the scheme, and it is a great improvement upon the previous arrangement.

1008. Looking at the peculiar position of Hull, being a large port, is not that perhaps the best arrangement that is feasible?—So far as the present powers of the corporation appear to extend, it seems to be the best arrangement that could have been made.

1009. Have you reason to complain of a want of energy or zeal on the part of the Hull corporation during the present year?—Certainly not.

1010. Have they seconded your wishes with vigour and promptitude?—I believe they have adopted every suggestion that has been made.

1011. At once?—At once.

1012. There have been three cases of outbreak, I think, in Hull this year; as to the last outbreak, I think you stated that you had some doubt about its being really cattle plague, from the fact that it had occurred at a very considerable period of time after the former outbreak?—That was the ground of my conclusion.

1013. But supposing that self-same outbreak had occurred within three weeks instead of six weeks of the last case, you would have changed your mind?—Three weeks would have been a very long time.

1014. Say a fortnight?—If it had been a fortnight or ten days, I should have had no particular doubt about the matter.

1015. It appears that cattle may have some kind of disease of a very similar description and character to cattle plague, and whether or not it is to be considered cattle plague entirely depends upon the length of time that has elapsed since a previous outbreak?—That would influence one's opinion to a large extent.

1016. Then there must be a disease very nearly akin to cattle plague which is prevalent, but which is really not cattle plague?—There are several diseases which have symptoms very closely allied to those of cattle plague.

Mr. *Norwood*—continued.

1017. And you very frankly stated that in your experience in former years, you had in some cases considered cattle plague to exist in which you think now with mature judgment it did not exist?—I remember some cases in which I am perfectly certain that it did not exist.

1018. In the first case of outbreak in Hull from the "Hansa," your inspector positively declared that it was pleuro-pneumonia, and was not cattle plague, and in fact there was no suspicion of cattle plague in that case was there?—There was no suspicion of cattle plague at the time and from his post-mortem examination, he concluded that the animal had some inflammation of the throat; but pleuro-pneumonia, which he first suspected he found, did not exist, the lungs being perfectly healthy.

1019. I have then, to a certain extent, accounted for two outbreaks out of the three; now are you absolutely certain in your own mind that even the intermediate outbreak was pure cattle plague?—I at the time entertained some doubt about the matter, but no investigation was made.

1020. Then it is within the range of possibility that not one of the cases of so-called cattle plague in Hull this year, was really cattle plague?—I think I may say that it is within the range of possibility, but the history of the first outbreak is quite consistent with the idea of cattle plague.

1021. I think the reason why you came to the conclusion that it might have been cattle plague was that you traced the fact of some of the animals by that ship having left the same lair, as in that case which you had at Deptford?—That was the chief reason, coupled with the fact that two of those animals showed some symptoms which might be taken to represent cattle plague in the early stage.

1022. Does it not appear to you that considering the uncertainty that exists as to the real cattle plague or false cattle plague, it is rather a serious matter to prohibit the importation from Germany altogether to this country?—No; because I think there can be no question at all that we did get cattle plague of the most pronounced kind introduced into this country by those animals which were brought over on board the "Castor"; and the history of the progress of the disease in the metropolis and in Essex would be sufficient to convince me, even if I had not identified the affection on its entrance here.

1023. I think you have no hesitation whatever in your mind as to the impossibility of cattle plague existing in England without originating from foreign contagion?—I am quite clear upon that point. I may say, in reference to the difficulty of identifying cattle plague, that I refer only to exceptional cases. In the majority of instances there is not the slightest difficulty in detecting cattle plague when the symptoms are all fairly developed.

1024. I think a couple of days ago you received a letter from the town clerk of Hull forwarding your intimation as to the fact that they had taken every step to ascertain if there had been any movement, in the dairy sheds, of cows or of cattle, to account for the last outbreak, and I believe his statement to you was very decisive that there had been none?—He stated distinctly that no stock had been removed from any dairies excepting those

Mr. *Norwood*—continued.

those in which cattle plague had previously existed, and that no circumstances had occurred to lead to any suspicion that the disease had existed between 22nd March and 5th May.

1025. With reference to Hull, it is the gate to the West Riding, and to the dense manufacturing populations of Lancashire and Yorkshire, is it not?—It is.

1026. And therefore the importance of the import through Hull to this district, which was dwelt upon by the right honourable gentleman the Member for Bradford, a connection with London will apply, though perhaps, in a somewhat smaller degree as to the question of food for the poor?—Undoubtedly.

1027. You suggested some very stringent regulations with reference to the control over vessels, and crews, and persons, bringing over cattle from abroad; I suppose it has struck you that any such restrictions would enormously enhance freights?—I have no doubt that they would.

1028. And possibly they would enhance freights to such an extent as really to prohibit the importation of cattle from anywhere?—I do not think they would; the profits on the cattle trade are very considerable.

1029. I am talking more especially about Hull. I think that there are no vessels trading to Hull with cattle that are exclusively fitted for cattle, but they convey other cargo?—They do, all of them.

1030. Of course any severe restrictions upon those vessels would necessarily tend to cripple their proceedings very greatly indeed?—It would have the effect of driving most of those vessels out of the cattle trade, but I apprehend that some of them would be selected for the purpose, or others would be built, as they are in London, exclusively for carrying cattle.

1031. The importations into Hull are not upon such a large scale as the importations into London; do you think that it would be practicable, and payable, to devote Hull vessels exclusively to that trade?—I think that probably one vessel might be made to take the place of half-a-dozen, and larger cargoes might be brought in them, instead of small ones.

1032. Has it struck you that there would be a great hardship to the poor consumers not having the fresh offal in the way that they have now, from the cattle being slaughtered at the port of debarcation?—I do not think that that objection is a very strong one, because offal is now constantly sent from Deptford to Birmingham and Manchester, and other large towns.

1033. I am aware that that is the case, and always has been the case, and that is the basis of my question. We send from Hull all these kind of offal to Birmingham, and Manchester, and Leeds, and Bradford; but, supposing the offal to be sent from Hamburg, would it not make a very material difference as to the condition of the article at the time it reaches the consumer?—Undoubtedly; unless it was sent over properly preserved by means of a cooling apparatus.

1034. You are aware that the head, the pluck, the tripe, and the internal offal, and even the blood are articles very much desired by the poor, and eagerly bought by them?—I am aware that the offal is, but I was not aware that the blood was used in any way by the poor.

1035. Supposing that it was possible to convey

Mr. *Norwood*—continued.

that offal from Hamburg, as offal, would it not be a very costly operation, as well as a very difficult operation to effect, from the nature of the article itself?—I should think that the conveyance of offal would take place in connection with the establishment of a dead meat trade with Hamburg, under some such system as that which is adopted in carrying the meat from America.

Professor *Brown.*

17 May 1877.

1036. And that system, you say, has not yet been fully tested, and you are not personally acquainted with it?—I am not.

1037. Do you not think that the great loss that occurred to the country from the outbreak of cattle plague in 1866-67 would have been greatly mitigated if the country had been prepared for it, and if your Department had been in its present efficient state, and able to cope with it?—I have no doubt that we should have dealt with it as we have dealt with subsequent outbreaks.

1038. I think you have stated that you do not apprehend any such serious loss occurring again?—I cannot imagine that such a loss is at all possible.

1039. You do not know of any refrigerators being adopted in any other trade but the American trade?—I am not aware that they have been adopted in any other trade.

Chairman.

1040. In answer to the right honourable gentleman the Member for Bradford, you stated that you were aware of the Report of the Committee of 1873, and you were examined rather in detail upon it; has that Report of 1873 been considered by the Lord President's Department since that time?—I believe it has been frequently under the consideration of the Lord President; I judge from conversations which I have frequently had with the late Secretary, who was then in a position to bring these matters under the Lord President's notice.

1041. Was it thought advisable to introduce a Bill, and if not, what were the reasons which prevented a Bill being introduced to carry out those recommendations?—I believe it was not thought advisable to introduce a Bill to impose a few regulations, and it was believed that any more extensive measure including all the changes which would then have been suggested, would have led to a very great deal of discussion, and, in short, that in the then temper of the country, there would have been no chance whatever of getting those further powers which the Privy Council would have asked, if any new Bill had been introduced.

1042. At that time, cattle plague not being in the country, there would have been great difficulty in taking those stronger powers by an Act of Parliament?—There would; and there would probably have been a disinclination on the part of the chiefs of the department to press any such measure, because I am aware that the Secretary had a very strong belief in the efficacy of the international regulations which were the result of the Conference at Vienna in 1872. The German Government was equally strong in its convictions of the value of those regulations, and we were constantly pressed by the German Government to relax the restrictions which already existed.

1043. I suppose that the recommendations which required legislation principally related to the

Professor *Brown.*

17 May 1877.

Chairman—continued.

the cattle plague and pleuro-pneumonia?—Chiefly.

1044. With respect to the recommendations, you were asked this question, "Have you found an evil arising from the alteration contemplated by that recommendation not being carried out?" and you say, "Not during the last outbreak"; have you been able to deal with that under your existing powers?—During the last outbreak the local authorities have in nearly every instance slaughtered all the animals which were in contact with diseased ones. If they had refused to slaughter them, we could have acted under Section 75.

1045. That is the section which you have put in operation now with regard to the metropolis, is it not?—It is; on one occasion, where the local authority hesitated to slaughter the animals that were herded with the diseased ones, the Lord President himself insisted that the slaughter should take place; and at the moment that our officer had gone down to give the order the local authority's officer was there upon the same errand, so that we were not called upon to interfere.

1046. With regard to pleuro-pneumonia I suppose it was not thought expedient to legislate upon that, because of the question having been and being still under consideration as to dealing with it generally in the country?—I believe it was thought desirable to try the effect of the slaughtering order fairly, before any further legislation was had recourse to; and during the last two years that action taken by the local authorities has certainly produced some impression upon the disease.

1047. Another of the recommendations of the Committee of 1873 with regard to sheep-pox was that the slaughter of all sheep affected by it should be compulsory with compensation; why was not that carried out?—In the event of an outbreak of sheep-pox occurring we could have acted under the same 75th section, and have ordered slaughter if we had thought it necessary; but as a matter of fact we have succeeded in extinguishing the disease by the process of shutting up the farm on which the diseased animals were kept.

1048. And therefore it was not considered so pressing?—It was not.

1049. Then the recommendation that that Committee made with regard to glanders has not been carried out either, has it?—No; it was believed that so much difficulty would arise if inspectors had power to order the slaughter of valuable animals on the plea of their being affected with glanders, a disease which it is more difficult to recognise than cattle-plague, that it would be impossible to carry out any system of slaughter without at the same time giving compensation, which would involve sometimes very considerable cost.

1050. And that the recommendation was not a just recommendation, looking at the compensation?—It seemed to be unjust to pay a man for slaughtering an animal for pleuro-pneumonia, and to refuse to compensate a man for slaughtering a horse because it was affected with glanders, except to the extent of a few shillings. The present regulations amount almost to a power to slaughter inasmuch as local authorities have power to summon a person who owns a glandered horse, and make him show cause why he does not slaughter it. Unless he can show reasonable cause, they have power to compel him to slaughter.

Chairman—continued.

1051. With regard to the evidence which was given before the Committee in 1873, as to the slaughter at the port of debarcation, the Committee then recommended "That no change should be made in the Act so far as it relates to foreign animals, but that the Privy Council should continue to order the slaughter at the landing places of all foreign animals imported from countries in which cattle plague exists, or from which there is reason to fear it might be introduced." Has that been done?—That has been done.

1052. In fact, as soon as cattle plague appeared in England, you prohibited the import of cattle from Germany?—Yes, we went beyond that recommendation in that case, and stopped the import of live animals.

1053. Another recommendation of that Committee which was referred to, was as to the limitation of the ports at which animals can be landed; have you acted at all upon that?—We have struck out several ports where the arrangements were not sufficient, or the trade was unimportant, and we have also revoked several defining orders; so that the number of ports where cattle can now be landed from scheduled countries is exceedingly limited. There are only nine ports now where cattle from scheduled countries can be landed.

1054. How many have been reduced?—Seven out of sixteen.

1055. Will you mention the ports which have been stopped?—The ports which have been undefined are Dover, Glasgow, Granton, Leith, Littlehampton, Newcastle-upon-Tyne, and North Shields.

1056. And what are the nine ports which are now left?—Those are Goole, Grimsby, Hartlepool, Hull, London, Middlesborough, Plymouth, Southampton, and Sunderland.

1057. The right honourable gentleman referred next to that part of the recommendation which dealt with the foot-and-mouth disease, and which was adopted, I believe, by the Privy Council of that day; that was reversed, as I understand, in June 1874?—It was.

1058. What was the ground upon which it was reversed?—The ground was, that foot-and-mouth disease had again begun to spread over the country, and some agricultural societies, including the Royal Agricultural Society and certain local authorities, very urgently requested that they might have power to put in force certain regulations for their own protection, and this permissive power was granted.

1059. Then, I think, since that recommendation, you have dealt with the question of compensation, and you have altered the compensation; have you altered it in the sense in which it was suggested by the Committee that it should be altered?—Not precisely; the compensation which originally was one-half of the value of the diseased animal has been raised to three-fourths, the total sum not to exceed 30 *l.* The recommendation of the Committee was, that the owner should be compensated to the extent of three-fourths of the total loss which he had incurred in any way as a consequence of the disease; but I believe that it was found very difficult to make any reasonable calculation of the indirect loss which would be incurred by the owner

Chairman—continued.

owner in consequence of having his animals slaughtered.

1060. And that was the reason which led you not to adopt the suggestion in that case?—It was.

1061. With regard to the Irish trade, there was a good deal of difficulty about that, and suggestions with regard to it were made by the Committee; what has been done recently about that?—The Lord President has been constantly in communication with the Irish Government upon the subject, and in 1874 we appointed additional inspectors for the purpose of examining animals landed from Ireland at various ports in this country, in order that they might give notice to the local authorities to enable them to act under this permissive power which had been given them by the Order in June. An Act was also passed providing for the slaughter of animals affected with pleuro-pneumonia.

1062. That brought Ireland into the same position with regard to the compulsory slaughter for pleuro-pneumonia that this country is in, did it not?—It did.

1063. May I ask whether that is the reason why, in answer to a question which was put to you by an honourable Member to day; you stated that Irish cattle were still inspected at Bristol?—It was not in particular reference to pleuro-pneumonia, but in reference to contagious and infectious diseases generally.

1064. If they are inspected at Bristol, why are they not inspected at the other ports?—They are inspected at nearly all the ports where Irish animals are landed.

1065. Is it supposed to be a regulation of the Department that Irish cattle landed from Ireland, should pass under inspection?—So far as we know the points of landing, our object is to inspect the animals at all those points; but I may say that there is no restriction on the landing of cattle; they are not in the position of foreign animals, which can only be landed at certain parts.

1066. They are treated in the same way as cattle belonging to this part of the United Kingdom?—They are; any ship coming from any part of Ireland may bring cattle, and may land them at any landing place where it happens to be lying.

1067. The only thing that has been done with regard to the Irish trade has been to place the Irish trade, with regard to compulsory slaughter for pleuro-pneumonia, on the same footing as the English trade?—That has been done.

1068. You stated, in answer to the right honourable gentleman, that you had changed your opinion as to the question of cattle plague, and the necessary regulations with regard to it; is that in consequence of every year proving that our supplies are drawn from countries which are more distant from us, and over which we have less control?—That is one reason, and another reason is the fact that the facilities of transit are increasing every year, from the extension of lines of railway into those countries where cattle plague has a permanent existence.

1069. And that, instead of as formerly, getting from Germany, and from those countries, cattle that had been for some time in the country, and therefore had practically gone through a quarantine, we are now drawing our supplies more from the centre of the disease, namely,

Chairman—continued.

from parts of Russia?—Our supplies come through Germany; but we have no means of preventing the passage of animals from these centres of disease into the German empire in the first instance.

1070. And you do not agree with the right honourable gentleman's suggestion that it would be unreasonable to prohibit the import of cattle from places where cattle plague seldom exists, only because we do not get information from those places; but you think that it is a means of protection that we ought to adopt?—I think that it is quite reasonable, because the history of the recent outbreak goes to show that, with the greatest desire on the part of continental Governments to give us early information, they fail to give that information in time to enable us to prevent considerable damage.

1071. I think that one honourable Member, who questioned you as to your idea with regard to the stoppage of the German trade, asked you whether the prohibition of the German import, except for slaughter, had diminished the number of animals which had come to this country?—I believe the diminution has been unimportant, for the reason that during this time of the year we get very few cattle from Germany.

1072. There has been no variation in the prices in the market in consequence of the order prohibiting the free ingress of cattle from Germany?—None that I am aware of.

1073. You were asked also, with regard to the American supply, whether you were aware that it had not been tried in the summer; are you aware of a Return which has been made to the House of Commons, at the instance of an honourable Member, as to the importation of meat generally into the country?—I am.

1074. If you look at the column of "Imported Fresh Beef from the United States," I think that Return shows that a very large import, amounting to 9,000 cwt. in August last year, came in as fresh meat from America?—That appears from the Return.

1075. Have you any knowledge or information as to whether that meat came in proper condition to this country?—I am not aware, in reference to those particular cargoes, but I am told that a very large quantity of meat has been condemned as unfit for food.

1076. Is that recently, or was it at that time?—I have only heard recently of that having happened.

1077. These figures show that the trade has gradually risen from its commencement in January last year up to 9,200 cwt. in August, and to 35,000 cwt. in December; and that would rather lead to the inference, would it not, that the trade had not been a failure in August or they would not have continued it?—It would. The increase, of course, is very much greater in the colder months of September, October, November, and December.

1078. I think, in answer to a question which was put to you by an honourable Member with regard to slaughter, irrespective of radius, you were referring to the Pocklington case, were you not?—Yes, where the disease was first detected.

1079. Was what you meant by that, that if you had been able to slaughter the herds which had come in immediate contact with the farm on which the disease broke out, the probability is that you would have stopped the disease altogether, but that the power only enabled you to slaughter those animals upon the farm itself,

Professor *Brown.*

17 May 1877.

Chairman—continued.

which were in actual contact with the diseased animals?—That was my meaning.

1080. You mentioned the existence of a new disease in Texas, are you aware whether there is any import, or whether there is a growing import of live animals from America at the present moment?—There has been some increase in the number of live animals imported during the last few months.

1081. Do you think that disease is one that is likely to be imported into this country?—I am not in a position to speak very positively upon that point.

1082. Would it in your opinion be as necessary to take precautions against the introduction of the live meat from America, supposing the Texan disease to be as fatal a disease as it is represented to be, as against the introduction of disease from the continent?—I think from the little we know of the disease, we should be hardly justified in prohibiting the importation of live cattle from America. It seems so much to depend upon climate and to be so confined to the Gulf Coast, that in all probability it would not spread in this country even if animals in that particular condition were to arrive here.

1083. And you think that there would not be the danger of such a destruction of our herds from its coming suddenly upon us, as there was from the cattle plague coming upon us suddenly in 1865?—I apprehend not.

1084. I think that in answer to the honourable Member for Hull, you stated that the arrangements at Hull were very considerably improved?—They will be when the suggested changes are completed.

1085. I think that that was one of the ports which before the Committee of 1873 was referred to as being thoroughly insufficient in its arrangements with regard to its cattle market?—It was, with regard to the defined part of the port.

1086. And at that time, I think, you stated that you believed that the regulations which were necessary in London were equally necessary in all ports where foreign imports was allowed?—I did.

1087. That, I understand, has not up to the present moment been altered though it is in process of being altered?—It is in progress.

1088. Can you state what is the annual import of foreign stock to Hull?—I find that there were during the year 1876; 343 head of cattle; 1,185 sheep and 3,207 swine from Denmark; 6,796 head of cattle 15,599 sheep and 1,104 swine from Germany; 15,647 head of cattle, 2,931 sheep; and 1,310 swine from the Netherlands; 191 head of cattle, and 371 sheep from Norway; and three swine from Russia, which I presume came as surplus ships' stores.

1089. That makes a total of about 22,000 cattle imported into Hull for the district which they feed?—It does.

1090. I think the honourable Member asked you a question with regard to vessels conveying cattle alone into the Port of Hull; it would be quite possible, would it not, if the trade exists there to that amount that vessels could be set apart for that traffic alone?—Undoubtedly, as I think, the freight would return something like 1 *l.* per head for the cattle.

1091. I suppose that in your opinion, there is an immense increase of danger in cattle being brought in with other cargo?—So far as cattle plague is concerned, there can be no doubt of the fact.

Chairman—continued.

1092. It has always been the recommendation of the department, that where cattle import trade exists, it should be a trade carried out in ships devoted exclusively to that purpose, has it not?—It has.

1093. So that your inspection may be complete as to the introduction of disease?—Decidedly.

1094. With regard to the question of the import of offal, I think you stated in answer to the honourable Member, that a very large portion of the offal that is supplied to Manchester and other large towns, passes through London, and is carried down to those towns, and delivered fresh in competition with the offal of the beasts slaughtered in the place?—It is.

1095. Are you aware whether any quantity of that offal comes from abroad?—I know that a considerable quantity of offal does come from abroad, but I do not know what proportion.

1096. Are you not aware that a considerable number of tons of offal are imported from abroad and sent through to the towns, and yet on arriving there, it is able to compete with the fresh killed offal?—I am aware of that.

1097. Does that come from Hamburg?—I am told that a considerable quantity is brought from Vienna.

1098. That is under a state of things in which the new idea of these refrigerating modes of conveyance has not entered?—It is.

1099. And, therefore, if that is possible, as applying to the trade of London, it would be equally possible with the Hull trade?—Undoubtedly it would; I should perhaps explain in reference to Hull, that I should leave a large proportion of the German trade still at that port as all the cattle from Schleswig and Holstein, which under my system, would still be landed at a defined part of a port for slaughter, so that it is not total prohibition.

1100. So that under the scheme which you have proposed, Hull would practically not be placed in a different position from that which it is in at the present moment, either with regard to offal or with regard to the import of cattle?—It would not.

1101. In answer to an honourable Member, you stated that the system that you proposed as superseding the local authority, would be a more expensive system at first. I suppose that refers to the answer which you gave me before, that it would entail an additional number of inspectors in the first instance, the total number being from 1,800 to 2,000?—It would.

1102. But practically, the working of the system when once it was set in motion, would not necessarily be more expensive?—I believe not.

Mr. *Norwood.*

1103. Are you satisfied as to the offal being imported from Vienna in any quantity?—I am not quite satisfied; I believe I was told so by one of the importers.

1104. Then you rather qualify the direct assertion which you made?—I do not know it of my own knowledge.

Chairman.

1105. I understand that in answer to a question which was put to you by the right honourable gentlemen, the Member for Bradford, you hand in a paper showing the losses incurred in the last two outbreaks?—I do as nearly as we could obtain the information. (*The same was delivered in,* see *Appendix.*)

Professor JAMES BEART SIMONDS, called in, and Examined.

Chairman.

1106. YOU were connected, I think, with the Privy Council Department for many years, were you not?—From its foundation in 1865 to 1872, when I left the department.

1107. And you had to deal with the outbreak of cattle plague in 1865-66-67?—I had.

1108. Since 1872, you have ceased to be connected with the department, have you not?—I have entirely ceased to be connected with the department since 1872, having accepted office at the Royal Veterinary College as the principal.

1109. And therefore you have had nothing to do with the official work since that time?—Nothing whatever.

1110. From your previous experience in the department, and your experience now, will you give the Committee your opinion as to the effect of importation on the introduction of cattle diseases; that is to say, cattle plague, pleuro-pneumonia, and foot-and-mouth disease, into this country?—Both pleuro-pneumonia and foot-and-mouth disease existed in this country previously to the alteration in the tariff in 1842. Cattle plague was introduced for the first time in 1865, and remained until 1867, and produced of course very serious losses to the country; I do not think that either pleuro-pneumonia or foot-and-mouth disease have been materially added to as existing in the country from the time of their being first observed by the introduction of animals from abroad. They have been added to, to some extent, but I do not think materially.

1111. You are confining yourself now to pleuro-pneumonia and foot and mouth disease?—I am.

1112. Do you think that that applies to pleuro-pneumonia?—Undoubtedly, we run a greater risk of increasing the number of cases of pleuro-pneumonia in the country by our importation than we do with regard to foot and mouth disease.

1113. That is in consequence, I suppose, of the time which it takes to develop the disease?—Exactly so. Animals may be admitted from the continent, which give no evidence whatever of the disease, and the disease may manifest itself some weeks after those animals have arrived in the country.

1114. Do you still think that the introduction or importation of foreign stock has not in any way materially increased the pleuro-pneumonia, in the country?—I do not think it has materially increased the number of cases of pleuro-pneumonia, and I came to that conclusion from the simple fact that we had quite as many cases of pleuro-pneumonia in 1841 and 1842, as I think we have had in any other year since, and the same with regard to foot and mouth disease. I have stated previously to other Committees that in my experience the outbreak of foot-and-mouth disease in 1839 raged to a greater extent in 1840 and 1841 than it has ever raged since, and was more destructive to life at that time than it has ever been since.

1115. That being before foreign importation existed to any extent?—Quite before the importation existed. The importation took place, if I remember rightly, about the middle of 1842. Oxen were brought in paying a rate of 1*l* a head; that limited the number considerably, and then after a short time they were brought in free. These serious outbreaks took place previously to that time.

Chairman—continued.

1116. Was there any evidence at the time of how the foot-and-mouth disease originated in this country?—No satisfactory evidence was obtained. It was thought that it was chiefly introduced through a morbid condition of the atmosphere; it was looked upon as an atmospherical disease, and it passed for some years under the name of the "epidemic among cattle." I have since thought that it was quite possible that it might have been introduced by surplusage stores brought in by the ships, because it first appeared in the neighbourhood of Stratford, not very far from the docks, and it spread from there gradually throughout the whole country.

1117. At that time, I suppose foreign cattle were introduced to the limited extent of what are called ships' stores?—Yes.

1118. Therefore there was the possibility, though you did not then form that judgment, of its being so introduced as a foreign disease?—Yes; I have thought so since, though I did not think so for some time afterwards. The facts which we have arrived at with regard to the spread of the disease have led me to the conclusion that the disease must have been introduced originally in some such way as that.

1119. Your subsequent conclusions led you to think that it was not spontaneously generated in the country?—Certainly.

1120. That is with regard to foot and mouth disease; have you formed any opinion as to how pleuro-pneumonia was introduced?—No. It has been however stated that some Dutch cattle were sent, I think, to the consul representing Holland, at Cork, and that it was in that way that pleuro-pneumonia was introduced; but if those Dutch cattle were so sent it was quite contrary to the law existing at that time, cattle being prohibited.

1121. Pleuro-pneumonia had not been known in the country before that, had it?—Not before then.

1122. With regard to cattle plague, I understood you to say that that was introduced here for the first time in 1865?—It was.

1123. And in your opinion that was brought in from abroad?—It was brought in undoubtedly from Russia, and I believe by a cargo of cattle called the Retel cattle which arrived at Hull.

1124. How would you propose to regulate the importation of live stock from foreign countries under the existing condition of things, in which cattle plague has been supposed to be almost indigenous in Russia, and in which also the transit exposes us to the possibility of its being introduced into this country from that source?—To protect ourselves against cattle plague, I think is exceedingly difficult under any circumstances; I do not think that even if all the German cattle were killed on the other side of the water, it would give ample security to us against it, though it would undoubtedly reduce the danger to a minimum; and if that be so, then certainly if we killed all the German cattle upon this side of the water, we should still be liable to the introduction of the disease as we have

Professor *Simonds.*

17 May 1877.

Chairman—continued.

have been on this occasion, although German cattle are scheduled.

1125. You mean that on account of the difficulty of ascertaining when the disease breaks out abroad, and the probability that some of the cattle are already on their voyage to this country from those parts, it is excessively difficult to prevent the import of the disease?—Exceedingly difficult. Cattle plague belongs to Russia and it not unfrequently makes its way from Russia into Eastern Prussia, or you may say into all those countries which border immediately upon Russia. It belongs no more to those countries than it belongs to us; it is always imported from Russia into them. Take Galicia, Wallachia, and Moldavia, as directly bordering upon Russia, they are quite free from cattle plague themselves, except when it is introduced by cattle coming from the valleys of the Dnieper, the Dniester, the Bug, and the Lower Danube.

1126. That district is practically the home of the disease?—That is the home of the cattle plague.

1127. And I suppose that the danger to our country is more due to the fact, that as other countries are becoming large consumers of meat, the supplies are drawn nearer to the home of the disease than they used to be?—That is one source of danger. Another source of danger is the intersection of all those countries now by railways, which have direct communication with all the railways, it may be said, in central Europe, and, of course, with those on to the western coast.

1128. Multiplying in that way the difficulties of at all preventing diseased cattle being introduced here?—Just so.

1129. Do you think that any regulations could be framed which would do away with that danger, or do you believe that the absolute prohibition of live stock coming into this country is the only mode of preventing the introduction of cattle plague?—Absolute prohibition of the importation of cattle might not of itself be sufficient; that is to say, from Germany, and Belgium which is a transit country, because it is quite possible that even sheep might bring it in.

1130. As a fact, it has not been introduced by sheep at any time, has it?—It has not been introduced by sheep at any time, but sheep are liable to the disease, and it is well known that, even supposing that they were not liable to the disease, like men or any other animal, they could communicate the disease, having come in contact with animals which were infected with it.

1131. You think it is possible that sheep would carry the disease for a considerable time, and communicate it, after being landed in this country, to cattle?—I think it is quite possible that sheep might be exposed on the other side of the water to cattle plague, and that although they themselves might not take it, they might bring it into this country.

1132. All that rather tends to show that, in your opinion, even the absolute prohibition of the introduction of cattle would not be an absolute safeguard against the introduction of the disease?—It does.

1133. Have you considered the question of quarantine as affecting the prevention of the disease?—I imagine that quarantine would never be attempted in this country with fat stock. All fat stock arriving here would be slaughtered very shortly after its arrival. Quarantine could only

Chairman—continued.

be established with regard to store stock coming from countries which are now unscheduled.

1134. With regard to fat stock, you see no other means of dealing with it than by slaughter at the port of landing?—Slaughter at the port of landing of course reduces the risk, and that has been carried out practically by placing Germany and Belgium and France and some other countries in the schedule.

1135. You have heard the evidence of Professor Brown; do you agree with him that you should prohibit the import of cattle from Germany and Belgium, because they are the principal transit countries of Russian cattle to this country?—Unless we could make international arrangements with Germany so that Germany would keep her frontier closed against the introduction of cattle from Russia, and would also give us information if she knew of the disease even approaching her frontier, I think we really must have recourse to excluding German cattle from England.

1136. I believe that it has been attempted on several occasions, has it not, to bring about such an international arrangement with Germany?—I believe it has.

1137. And it was found not to be practicable?—I believe that that is so.

1138. And the result has been that on this occasion it has been introduced through those sources?—Yes; but I look upon its introduction on this occasion as special and peculiar, because it is contrary to what has hitherto taken place with regard to cattle plague from Russia. It was brought by dealers directly across the country to Berlin, and then on to Hamburg. I look upon its recent introduction here as rather an exceptional case.

1139. Do you mean that that is not so likely to occur again as to induce the necessity of taking special precautions against it?—I think that it is not likely to occur again; the cattle traffic at the present time has altered considerably in consequence of the war between Russia and Turkey.

1140. But that alteration had not taken place when this outbreak of disease occurred?—No; but the Russian troops were mobilised on the Pruth, and contiguous districts, and it is just possible that that might have called for a larger supply for the commissariat, and consequently afforded facility for dealers getting hold of animals which were affected with cattle plague.

1141. Bearing out the evidence which was given before the last Committee, that when Russian armies moved, the cattle plague moved with them?—Just so. I believe at the present time the Russian soldiers are eating a considerable amount of cattle-plague meat.

1142. Do you agree with the evidence of Professor Brown, that the cattle plague in Russia is not the fatal disease that it is when it is imported into our climate?—Yes, that is so; and it arises, I think, from a variety of causes. First, we may say that they have hardier animals perhaps in the parts of Russia to which I have alluded than we have in England, and they bear up against disease better. Then there is another cause, which was brought to light here in 1865–67, during the time that the cattle plague prevailed, which was this, that in the case of cows that are pregnant, presuming that they carry their calves to the full length of time, the cow taking the disease

Chairman—continued.

disease during her pregnancy, the calf which she drops is insusceptible of the affection. Then when we come to look at the enormous quantity of cattle that are bred in the steppes, we can clearly enough see that the cause named is in operation to give security to a very large number of them.

1143. Have you any record of the per-centage of those cows which die, having got the disease when they are pregnant?—No; there is no separate record, but we know of several instances which occurred in this country of animals which did not die when they had the cattle plague, and which were pregnant. There was one notable instance in Islington, and I saw the calf afterwards, and that calf was exposed again and again to cattle plague, and did not take it. There was another similar case, if I recollect rightly, in Yorkshire. There would be a much larger number of animals that would recover in Russia, in consequence of their hardiness, than would recover here with our more delicate breeds, and therefore those cases would multiply considerably there.

1144. That accounts for their not taking the precautions in Russia against the disease which are supposed to be necessary in this country?—I do not think that they could in those countries take the precautions which are absolutely necessary to get rid of the affection.

1145. Turning to the question of some international arrangement, I suppose what you would suggest is, that if Germany could be persuaded to adopt such regulations as I believe Denmark has adopted with regard to the import of cattle, she would be as safe to this country as Denmark is?—I do not know that she would be as safe as Denmark is, because the disease has very rarely reached Denmark. If my recollection served me right, it has not done so for the last 100 years.

1146. But in your opinion would the same regulations give sufficient security?—Yes, and then I think we might introduce cattle from Germany, but of course keep Germany in the schedule as we do now.

1147. But unless such regulations could be enforced you believe that Professor Brown's suggestion of prohibiting the import from Germany and Belgium as transit countries, is the only practical method to give us security against the disease?—I fully coincide in that opinion.

1148. With regard to the store stock imported from the continent, there is not a very large importation of store stock, is there?—There is not a very large importation, but still it is an importation of some importance, particularly into the northern ports, Leith and Granton, and others, from Norway, Sweden, and Denmark.

1149. Is there much import of store animals into this country, beyond the Dutch import into London for dairy purposes?—No, except in certain seasons when they cannot feed their cattle, in consequenc of a drought for example in Holland; then we have often a large number of store animals sent here, animals about a year to a year and a half old; but there is a constant supply, that is to say during this season of the year, particularly, of fat calves from Holland to London.

1150. Is that the consequence of our own breeding stock not being sufficient for the pasturage of the country?—It is because there is a great demand for veal which is sent in from Holland.

Chairman—continued.

1151. I understood you to say that you were dealing with the store animals as imported, but now you say that there is great demand for veal from Holland, which means for slaughter and not for store purposes. What I meant by my question was, whether you think that there is any great amount of pasturage which is not required for the home stock into which there is a necessity of introducing store stock from the continent?—There is to some extent, but it very much depends not upon the acreage but upon the yield. In some seasons a farmer can feed about a fourth as many cattle again on his pastures as he can at another season.

1152. Therefore it is not a direct constant trade, but it is only a varying trade, according to the season and the amount of grass that there is to consume?—That is so with Holland certainly, but there is a constant trade going on, I believe, between Denmark and Sweden and Scotland.

1153. Can you give the total amount of store cattle introduced into the country?—No, I do not think that the importations of store cattle have ever been separated from the fat.

1154. With regard to the importation from Ireland, have you considered the question whether the present regulations are sufficient for dealing with the disease there?—No.

1155. It has been stated that a good deal of both pleuro-pneumonia and foot-and-mouth disease is introduced from Ireland; do you concur in that opinion?—I have no doubt that foot-and-mouth disease is very frequently introduced into England from Ireland, and also that occasionally pleuro-pneumonia is introduced from Ireland into England.

1156. Do you agree with Professor Brown that you could make no regulations with regard to Ireland, unless you adopted the same regulations in this country?—Quite so.

1157. And that therefore if any fresh regulations are to be adopted in order to prevent the introduction of those diseases from Ireland, they must be accompanied by a scheme such as he proposes for attempting the eradication of the disease in this country also?—The two things are necessarily connected.

1158. Do you think that any such scheme as that suggested by Professor Brown, of stringent regulations dealing with the home trade of the country, would effectually stamp out pleuro-pneumonia and foot-and-mouth disease?—It would take some time to stamp out both pleuro-pneumonia and also foot-and-mouth disease; though I think that in course of time those diseases might be extirpated; but in order to do it, the regulations must be carried out very stringently indeed.

1159. Are you of opinion that regulations as strict as those must be, would be submitted to by the people in this country, if they have in view the object of stamping out the disease entirely?—I do not think they would.

1160. With regard to the trade in dead meat, has your attention been at all directed to this fresh trade which has sprung up from America?—Not specially so. I only know of it from reading and hearing about it.

1161. Do you think that the trade will be a possible one as supplying the food of the country?

Professor *Simonds.*

17 May 1877.

Chairman—continued.

—I have doubt with regard to the trade as to whether it is likely to be continued during the summer months especially, notwithstanding what has been stated with regard to the imports of meat during the summer and during the hottest weather. I think it is well known that even this winter very many cargoes of meat have arrived from America in a state nearly unfit for food. I believe that American meat which has been introduced into Liverpool, immediately upon being debarked has been sold at a very fair and remunerative price; and that part of the same cargo has been sold for a very much diminished price.

1162. In the same place?—In the same place, and when sent on also to other towns.

1163. I suppose the trade at present may be said to be in its infancy; of course, if you depend for the freshness of your meat upon its being kept in the same temperature, as soon as it has been landed at the port and removed from that temperature, its journey will deteriorate it; and therefore, although it may be perfectly fresh in Liverpool, it would not be delivered fresh in London unless it were carried on under the same conditions of transit?—Just so; that would be absolutely necessary, I imagine, in order to have the meat delivered in London in a condition fit for consumption.

1164. Are you aware whether those conditions have been carried out with regard to that quantity of meat which you describe as being condemned in London, or had it been landed at Liverpool and then sent by rail to the London markets, without the conditions of temperature under which it was brought over having been continued?—I am not aware.

1165. That would make an important difference of course?—It would, necessarily.

1166. And that might account for that quantity of meat being condemned, as you state, in the market?—Just so.

1167. I understand you to suggest, as Professor Brown did, that the importation of live animals from Germany and Belgium should be prohibited; have you considered the question of whether, under those circumstances, looking to the fact that we now receive from those countries about 60,000 beasts, a dead meat trade would take the place of that live import?—I think decidedly not.

1168. Could you give the Committee your reasons for saying that you think that dead meat would not come in to supply the place of the live cattle so prohibited?—Dead meat, if brought in, must be sold, and the price is liable to very great fluctuation, and it would very frequently, indeed, arrive here, even with the greatest possible care, in a condition not fit to be consumed. I think also that a great demand would spring up for the live cattle being sent to other countries, say to France, for example; live cattle can always be sold at a greater price than dead meat can be sold at.

1169. Practically it would result in this: that although at first no trade would come here at all, but would go to France, after a time the glut in France, from the double trade being there, would so reduce the price there as to bring the prices in England in favourable competition with it, and so re-introduce the trade here?—That might be so.

1170. The danger seems to be then in the first stoppage of the existing trade until the markets have regulated themselves, and the prices have brought a dead meat trade into existence?—Yes.

1171. Would you give the Committee a summary of what you yourself would recommend for dealing with these diseases in the country?—I should keep up pretty well the system that now exists, and keep certain countries in the schedule, and certain other countries as unscheduled. The countries that should be unscheduled, I imagine, are Norway, Sweeden, Denmark, Spain, Portugal, America, Canada, and the Channel Islands; and I should keep in the schedule until we could have security given, say by the Government, to guard against the introduction of disease, France, Germany, Belgium, Wurtemburg, and Bavaria, the latter being in direct communication with Austria. If France could close her frontier against the introduction of animals likely to be affected with cattle plague, I should put France among the unscheduled countries, and allow importation from her; but so long as the present state of things exist it will be necessary to keep France, Belgium, and Germany, in the schedule.

1172. Those are the countries from which you suggest that no import should take place?—Yes, no import should take place, I imagine, from Germany through Belgium; and I would exclude animals coming from France at the present time.

1173. How would you propose to deal with Schleswig-Holstein?—I should allow the animals to come from Schleswig-Holstein as they do now under special regulations. I believe something like 50,000 are sent here during the latter part of the year, from June to November, and as cattle plague has not existed in those countries, we do not therefore run any risk. I should allow those animals to come in and to be freely dealt with, and to go where they pleased.

1174. You would allow them to circulate freely?—I should.

1175. Would you attach to that any conditions as to inspection, or otherwise?—Yes, inspection and detention at the port of landing; and that detention should be certainly in all cases not less than 24 hours.

1176. Would that in your opinion be sufficiently long to guarantee you against an outbreak of cattle plague amongst those animals?—It would depend entirely upon circumstances. If, for example, a person were to select animals that had been exposed to cattle plague, and put them on board vessels and send them here, as from Tonning (taking an imaginary case altogether), looking at the period of time which the voyage occupies with the period of detention, 24 hours, that would not be sufficient. Against foot and mouth disease I consider that it would be sufficient.

1177. You stated that you thought you might allow cattle from Schleswig-Holstein to be introduced here under certain regulations, and that then they might circulate freely through the country; do you think that, as against cattle plague, 24 hours' detention is sufficient to guarantee you against the latent disease?—No. Of course we should be obliged to place Schleswig Holstein in the schedule, or prevent importation from there in the event of cattle plague extending.

1178. The whole of the evidence that Professor Brown has given went to show that our difficulty

Chairman—continued.

difficulty arose from the want of information, and that the cattle plague arrived here almost as soon as, or before, the information of the breaking out of the disease in the country from which the cattle came; might not that be possible with respect to Schleswig-Holstein, and would you not, therefore, be liable to the same introduction of cattle plague from there under the scheme that you have suggested, as you suffer now from Germany?—So many precautions are taken with regard to the introduction of disease from Germany we may say into Schleswig-Holstein (although Schleswig-Holstein now constitute a part of the German Empire) that I think there would be very little risk of the cattle plague extending into Schleswig-Holstein. We had the disease sent here from Hamburg and it has been in Hamburg once or twice. It was in Hamburg in 1872, but it did not extend to Schleswig-Holstein.

1179. Do you think that the precautions are sufficient to protect them against the Hamburg trade?—I think so.

1180. You say that you would admit animals under certain regulations and inspection; are there any regulations that you would suggest as to disinfection of ships?—With regard to the ships, I think that it would be a prudent measure that all ships which bring cattle should be disinfected, and I quite agree with the evidence that we ought to bring cattle into this country only in cattle ships, and not in ships which, besides bringing cattle, bring other cargo.

1181. You agree with that upon the ground that you are able to deal with it more effectually by disinfecting the ship?—Just so, and I think that the ship should be detained until we had ascertained whether the animals were or were not free from disease.

1182. You think that the ship should not be allowed to go without being disinfected if there was any suspicion of disease being brought in?—Certainly not, we should have power over her until we had satisfied ourselves that the animals that the ship brought were free from disease.

1183. Can you give the Committee any idea of the losses to the country at the time that you were engaged in the department in dealing with the cattle plague in 1865-67?—The losses amounted, I think, to about one-third of a million of animals from cattle plague in this country from 1865 to 1867.

1184. That would, as Professor Brown has stated, represent about 4,000,000 *l.* or 5,000,000 *l.*?—It would.

1185. Do you agree with him that it would not be possible that such a calamity should occur again in this country under the precautions that are now taken?—I think that it is quite impossible, with our present regulations ever to have anything like a repetition of what took place in 1865-67.

1186. Do you know what the losses in the outbreak of 1872 were?—They were not very many; the losses that took place were chiefly in Yorkshire.

1187. At that time there was no such loss as took place on the first occasion, was there?—The loss was very slight indeed which took place in 1872, and, as I have already stated, it took place only in the East Riding of Yorkshire; we had on that occasion no less than seven imports of the disease, and all between the 17th of July and the 29th of July. The first import was on the 17th of July of Russian cattle into London; the second was into Hartlepool on the 21st of July, a mixed cargo; the third was into Leith on the 22nd of July of Russian cattle; the fourth was into Newcastle on the same day, a mixed cargo; the fifth was into Hull on the 25th of July of Russian cattle; the sixth was into Hartlepool of German cattle; and the seventh into Newcastle, on the 29th, of German cattle. The first import was from Cronstadt, direct to London; the second was from Hamburg; the third from Cronstadt; the fourth from Hamburg; the fifth from Cronstadt; and the others from Hamburg.

Chairman—continued.

1188. That led to the stoppage of the Russian trade, did it not?—That led to the stoppage of the Russian trade. The disease did not escape from London, or Hartlepool, or Leith, or Newcastle, but only from Hull.

1189. On that occasion, as on the present occasion, it was shown that regulations do materially diminish the risk to the country, was it not?—Certainly.

1190. Whilst you consider that the existing regulations are in a great measure sufficient to deal with cattle plague, which is the worst complaint, you agree with Professor Brown that, with respect to Germany and Belgium, the trade ought to be prohibited if you wish to ensure the extinction of cattle plague here?—I do.

1191. But you could leave the other countries scheduled, and unscheduled countries, as you have described?—Yes.

Mr. *Arthur Peel.*

1192. The outbreak in 1872 was a very slight outbreak as compared with that of 1865-67; what were the regulations in force at the time of the outbreak in 1872 as compared with the regulations that are now in force; has there been any increased stringency in the regulations since?—I am not aware that there has been any increased stringency; the same regulations were in force in 1872 as are in force now.

1193. Do you argue from that that no increase of stringency is necessary?—Only with regard to the greater danger that we are running now, and have been year by year, in consequence of the greater facilities that are given for the movement of cattle from Russia into Germany.

1194. The facilities being greater, you think that increased stringency ought to follow?—Yes; some years since I went into Galicia for the purpose of studying cattle plague, at the request of the Royal Agricultural Society and the National Societies of Scotland and Ireland. At that time there were no railways beyond Lemburg, and Prussia (as then existing) was enabled to know when cattle plague was approaching her frontier, and would take measures to prevent cattle plague entering her territory; or suppose that cattle plague had made its way into Poland, Prussia would have information of it, and she would prevent the passage of animals over the frontier; but now, in consequence of the introduction of railways, there being three or four railways going from Germany into Russia, those barriers are broken down, and Germany does not herself get the information early enough.

1195. I did not quite understand the conditions which you said you thought ought to attach to a country, being a scheduled country; you

Professor *Simonds.*

17 May 1877.

Mr. *Arthur Peel*—continued.

would stop the importation of live meat, of course; would you stop the importation of dead meat, or would you be satisfied with slaughter at the port of arrival?—I should not stop the importation of dead meat from countries from which we have stopped the importation of live cattle.

1196. Not even if cattle plague was raging in those countries?—No; although it is quite true that meat will carry the disease, it would depend entirely upon the extent and the situation of the cattle plague in Germany as to whether we stopped the dead meat trade or not; Germany deals very summarily with the cattle plague, and will pretty soon stamp it out; there would be a risk supposing cattle plague were in the western part of Germany, but not much, I think, so far as dead meat is concerned, if it existed in the eastern part.

1197. Assuming the existence of cattle plague in a foreign part from which cattle came, say Hamburg, would it be a sufficient precaution in this country to slaughter the cattle at the port of arrival, coming from the infected port?—It would be hardly sufficient, I think, while the cattle plague existed.

1198. Not even with any precautions which you might establish at the port of arrival?—No.

1199. You mentioned, I think, that calves were insusceptible of disease when born from a mother which had the disease at the time of pregnancy?—That has been our experience.

1200. Is it possible to argue from that that inoculation would prevent the disease?—Inoculation on the contrary has been found to be exceedingly destructive in cattle plague. There have been many experiments in different parts of the Russian Empire, but they were soon abandoned in consequence of the great fatality that attended them. It was not found, as is generally the case, that the inoculated disease was milder than the natural disease.

1201. Is there any scientific explanation of the fact of the immunity of calves so born?—Merely that the system of the calf has been brought under the influence of the blood-poisoning or the specific virus of the disease while *in utero*, and that has guarded it against disease afterwards.

1202. But that is not the principle of inoculation?—That is not the principle of inoculation.

Colonel *Kingscote.*

1203. Did you go to Russia yourself?—No, I went to Gallicia.

1204. You do not know what rules or regulations the Russian Government make when cattle plague breaks out; do they make any?—They make very few rules indeed. They scarcely intercept the traffic, because Russia has to feed herself from the steppes, and there are something like 6,000,000 cattle, I believe, raised annually in the steppes, which are exported from the steppes to other parts of Russia, and they are or used to be, until barriers were put in the way, also exported to Germany and other countries.

Major *Allen.*

1205. You say that calves when born of mothers suffering from cattle plague are free from cattle plague, or at least they are likely to be free from cattle plague?—Yes.

1206. If that is so, how is it that in Russia where there must be a large number of those calves, the cattle plague does not decrease?—

Major *Allen*—continued.

I believe it to be one of the causes in operation to save a large number of animals in the steppes from the disease, and consequently to save a large number of lives. My opinion is, if I put it strongly, that if we could transport our cattle to the steppes of Russia, and let them be there exposed to cattle plague, we should in all probability lose from 80 to 90 per cent. of them; while not more of the animals die in Russia from the disease than 30 or 40 per cent.

Colonel *Kingscote.*

1207. Have you not heard it stated as a fact that when the disease breaks out in Russia, in some places, I do not say always, they rather let it burn itself out and let the whole of the cattle die, and then they say they are free from it?—I have heard of statements of that kind, but I have not much confidence in those statements.

1208. I distinctly understand you to give it as your opinion, and especially after the last outbreak of cattle plague at Deptford, that slaughter at the port of debarcation does not give sufficient immunity from cattle plague?—It is shown distinctly that that system has broken down when cattle plague has come direct from the port where it exists, as it did here from Hamburg to Deptford.

1209. When you were at the head of the Veterinary Department of the Privy Council, you gave us the times of the importation of cattle disease from Russia and Hamburg; Russia was scheduled, and Hamburg was not scheduled, was it?—Yes; Hamburg was scheduled, I think, at that time; the importation from Russia was prohibited afterwards.

1210. Why should not the importation from Hamburg have been prohibited as well as the importation from Russia, if they were equally dangerous sources of infection?—The prohibition of animals from a single place has not been found to answer. I remember perfectly well with regard to the sheep-pox, some years ago, that a number of animals were sent from Hamburg to England, or rather were attempted to be sent, and the shipping agents refused to bring them. When that was found to be the case, those animals were put upon the railway, and they were sent into England *viâ* France. I am afraid that if we scheduled Hamburg only, we should find those things continually going on.

1211. As it seemed to me that the disease in 1872 came equally from Cronstadt and Hamburg, I did not understand why Russia was scheduled and not Hamburg; can you give me any reason for it?—I cannot charge my mind just now as to whether Hamburg was scheduled at that time; I mean as part of Germany.

1212. Can you give me any positive reason?—I cannot at this moment charge my mind as to whether it was so or not.

1213. Do you consider it a step in the right direction that the Privy Council should supersede the local authority when the cattle plague breaks out as it did in Middlesex, and in the Metropolitan district?—Yes; I think that wherever cattle plague breaks out in England the Privy Council should supersede the local authority.

1214. Not because the local authority does not do its best, but because the Privy Council is better able to draw a cordon round the place?—Yes, and to carry out all the regulations which are necessary for disinfection, and so on, in a better

Colonel *Kingscote*—continued.

better manner than they could possibly be carried out by the local authority.

1215. And then there was no clashing of the boundaries of the different local authorities?—No.

Mr. *Chamberlain.*

1216. You do not suggest that any alterations are desirable in the regulations with respect to pleuro-pneumonia and foot-and-mouth disease, do you?—Not unless we are determined to do our utmost to free the country of these affections. If so the regulations with regard to foot-and-mouth disease must be the same practically as those with regard to cattle plague, with the exception of killing the animals. Places must be declared infected, all movement must be stopped, and fairs and markets, and so on, suppressed.

1217. But you agree with Professor Brown, do you not, that those regulations would be so unpopular as to be almost unworkable?—I quite agree with him in that respect.

1218. Do you know what proportion of the total import of live cattle is attributable to countries which you propose should be scheduled with regard to cattle plague?—From Belgium the number of cattle imported in 1876 was 6,704.

1219. The countries which you suggest should be scheduled are Russia and Germany, are they not?—Belgium should be scheduled; Canada free; Denmark free; France scheduled; Germany scheduled; The Netherlands scheduled, unless special arrangements are made that she would close her ports if necessary; Norway free; Spain free; Portugal free; Sweden free; the United States of America free; and the Channel Islands free.

1220. Then, including the Netherlands, the places which you would schedule appears to have sent about 170,000 out of a total of 274,000 head of cattle received from those foreign countries; would not the result of putting those countries in the schedule be considerably to effect the price of meat?—They are in the schedule, and they have been in the schedule for some time.

1221. What alteration is it you suggest?—I propose no alteration in the present system with the exception of guarding against the introduction of cattle plague from Germany *viâ* Belgium.

1222. By excluding cattle coming from Germany and Belgium?—Yes.

1223. Do you consider that their exclusion would materally affect the price of meat?—No, I do not think it would.

1224. Do you know from what source the Privy Council Office has generally derived the first information as to an outbreak of cattle disease in any of the English farms; has it derived it from the owner or from its own officials, or from other sources?—There are no officials of the Privy Council Office, save and except at the ports. The inspectors throughout the country are appointed by the local authority.

1225. Has the information generally come from them or from the owner?—That is a question I cannot answer. It is an official matter with regard to the present system which prevails.

Sir *George Jenkinson.*

1226. I think you said that prohibiting the importation of live stock would not attain absolute safety; is not your opinion that it would

Sir *George Jenkinson*—continued.

diminish the risk to a minimum?—It would reduce the risk, undoubtedly, to a minimum.

1227. Do you see any great reason against such prohibition; would it in the long run be likely to affect injuriously the price of meat to consumers, that is allowing both for the development of dead meat importation, and also for the diminished risk to our stock?—With regard to our loss here, I do not think that it can be at all ascertained what it is; nor do I think that it is attributable to the disease which is imported. I am speaking now, of course, specially with regard to foot-and-mouth disease and pleuro-pneumonia.

1228. I had cattle plague in my mind, chiefly in my question?—Cattle plague is undoubtedly invariably introduced into the country, and all the losses arising from cattle plague arise from such introduction.

1229. Then, do you think that if the importation of foreign live stock was prohibited, it would injuriously affect the price of meat to the consumer by raising it unduly above what it is now; that is to say, if you simply excluded the meat from countries where cattle plague has ever existed?—I should not exclude it from countries where cattle plague has ever existed; I should simply exclude it from those countries which are liable to have the cattle plague at any time. The only countries which are liable to have the cattle plague at any time would be Germany and others bordering on Russia; animals from Russia have been excluded for some time; it would be animals that would be brought from Russia into Germany that would be dangerous to us.

1230. But as a matter of fact, they are prohibited from Germany, are they not?—They are prohibited from Germany at this time.

1231. And the price of meat has not risen?—It has not, but then prohibition has only been in operation since the introduction of cattle plague on this last occcasion.

1232. Have you seen this Return which was issued yesterday on my motion (*handing a Return to the Witness*)?—I have not seen it.

1233. That return shows that in the last outbreak we lost 1,083 dairy cows, does it not?—I anticipate that we have lost something like that number.

1234. And that represents a loss which would be saved if we did not import the disease?—Certainly.

1235. Would not the enforced slaughter of imported cattle at the port of embarcation be some compensation for the loss of imported live stock; that is to say, would not much of the stock that now comes in alive, come in the form of dead meat?—I am not at all in favour of killing the animals on the other side of the water, and sending in the meat; I do not think that that would give us very much security or not a sufficient security. My opinion (though perhaps I am rather singular in that) is this: that if meat were killed on the other side of the water, we should have all kinds of animals sent to the abattoirs there, and sent in here as dead meat, and then I think we should run a very grave risk from time to time of introducing cattle plague by meat.

1236. But that is not the case with regard to the present importation trade of dead meat from America, is it?—There is no cattle plague in America; there is no disease in America that is

Professor *Simonds.*

17 May 1877.

Professor *Simonds.*

17 May 1877.

Sir *George Jenkinson*—continued.

known to be a fatal cattle disease, except the Texas fever, which has been alluded to this morning by Professor Brown.

1237. But the danger of infection of cattle plague from dead meat would be infinitely less than from the importation of any number of live stock, would it not?—Certainly.

1238. Then, so far, it would be a gain to slaughter at the port of embarcation rather than to import the live stock?—So far as that goes it would.

1239. I think that quarantine is practised at Southampton, is it not?—It is practised at Southampton with regard to animals coming from the Channel Islands, and with regard to them only, I think, but I am not certain on that point.

1240. My reason for asking was that I have heard it alleged that if quarantine were established, it would create a hotbed of disease; that is not the case at Southampton, is it?—They are not parallel cases; if we had quarantine established with regard to animals coming from abroad, we should certainly have a focus of disease which we should never get rid of; we should spread the disease all over the country. If we wanted to propagate disease all over England I do not know of a better plan of doing it than by establishing quarantine stations.

1241. Do you not think that quarantine being established at any port would tend to prevent people from sending diseased stock to that port?—I do not think it would.

1242. They would send it at a certain loss, would they not?—They would send stock notwithstanding the establishment of a quarantine station.

1243. But that is not practically the result at Southampton, is it?—There is no disease existing in the Channel Islands that has to be guarded against beyond the foot-and-mouth disease.

1244. I think that it applies to cattle from France also, does it not. I know one case where an English cow came from France that had been sent to France from this country, and she was returned, and she was not admitted into London, but had to go round to Southampton?—I do not know what the regulations are. We prohibit animals at the present time from France, and consequently I do not see how animals could be brought from France to Southampton and put in quarantine.

Mr. *Jacob Bright.*

1245. You consider, so far as I remember what you have said, that a trade in dead meat would never be so profitable as a trade in live animals, where the distance did not prevent a trade in live animals?—No, I think that the live animal trade is to be preferred to the dead meat trade.

1246. You think that in the case of a dead meat trade they never could be certain about the price which they would obtain?—That is so.

1247. They might have a great deal of dead meat that would sell at very low prices from the fact that it would not keep; live animals will keep and dead meat will not?—Yes.

1248. If the dead meat trade would be less profitable than the live animal trade on that account, of course there would be less trade in food with dead meat than with live animals?—It is likely to be so.

1249. Because whenever the profits are the best, the trade becomes the largest?—Yes.

1250. With regard to the United States, if

Mr. *Jacob Bright*—continued.

they were as near to us as Denmark is, you would not have a dead meat trade from them?—Not for those reasons.

1251. They would be sure to send us the live animals?—They would be sure to send us the live animals.

1252. I understand that you do not ask for any increase to the stringent regulations which already exist with regard to diseases other than cattle plague?—No, not any, unless we here are desirous of stamping out the diseases which have existed from the time which I have mentioned.

1253. Unless there could be complete co-operation?—Unless there could be complete co-operation.

1254. The restrictions are already very severe with regard to those diseases, are they not?—They are sufficiently severe to protect us fairly from the introduction of the disease into the country.

1255. That is to say, if a single animal, no matter of what kind, had foot-and-mouth disease, or pleuro-pneumonia, and you have a very large cargo, the whole cargo is slaughtered at the port of debarcation?—It is.

1256. Do you not consider that a very severe restriction?—It is a severe restriction, but it is not more severe than is necessary, because the animals that have been exposed to the disease on the voyage would communicate the disease to our animals, presuming that they were allowed to go from the port of debarcation alive.

1257. But you have no desire whatever to add to those restrictions unless by the co-operation of which you speak?—No, I have not.

1258. With regard to the restrictions on the cattle trade, the money losses in the present cattle plague amount to about 15,000 *l.*, do they not?—Yes.

1259. You have said that the loss in 1872 was very slight; do you mean that it was less than 15,000 *l.*?—I should think that it was considerably less than 15,000 *l.*; I have no positive information as to what the losses were in 1872, because I was not then in the office. I simply know the broad fact that there were a few places in the East Riding of Yorkshire that were affected with the cattle plague which had spread to the East Riding from the Hull cargo. I think the losses were very small.

1260. In that case, then, our regulations or means of detecting and of stamping out the disease are so perfect that for 10 years our money losses have probably not exceeded 20,000 *l.* with regard to cattle plague?—Yes, possibly that is so.

1261. You do not look to anything like perfection in human affairs, do you?—Certainly not.

1262. You do not suppose that farming, any more than any other trade in the country, can be carried on absolutely without risk?—Certainly not.

1263. And if they have reduced that risk to a loss of 20,000 *l.* in 10 years, the success of the present system must be admitted to be considerable?—Very considerable when we come to compare the condition that we are in now with our regulations, with the condition that we were in in 1865, when we had no regulations at all.

1264. And with that very great success might it not be a question whether it was wise to alter the system altogether, or even to make it more stringent?

Mr. *Jacob Bright*—continued.

stringent?—I imagine that that is the question which this Committee is inquiring into.

1265. I ask your opinion upon that question, whether it might not be wise to let well alone?—I am very much of the opinion that it would be perhaps as well to let well alone.

1266. With regard to Germany, you do not propose to put Germany in the schedule, but you propose to prohibit everything that comes from Germany as we are doing now, I think?—Yes, that is the most effective means, I should imagine, of dealing with cattle plague as being imported into this country from Germany.

1267. Germany is now a prohibited country, is it not?—Germany is a prohibited country.

1268. And you propose that it should remain so?—I propose that it should remain so in the event of any change being made in our present system.

1269. You propose, do you not, that Germany should continue a prohibited country in any case?—I cannot say that I do. I think that when the danger is passed we might put Germany back into the schedule, but if any steps are taken beyond those now in existence to protect us against cattle plague, I imagine that the only thing which we could do would be to prohibit the import of animals from Germany.

1270. When was Germany prohibited?—Upon the introduction of cattle plague within the last few months.

1271. Before that was Germany scheduled, or unscheduled?—Scheduled.

1272. For how long had it been so?—For some years; ever since the alteration was made with regard to the division of foreign countries into scheduled and unscheduled countries.

1273. Then Germany was a scheduled country for some years without any case of cattle plague?—Yes.

1274. And, of course, it was a great advantage to us to get from Germany those 60,000 head of cattle, or thereabouts, that we had?—A great advantage.

1275. But I thought you said that the exclusion of that great amount of cattle did not affect the price of meat?—It is found that the price of meat has not yet been affected by the prohibition of the importation of animals from Germany, but the prohibition has been in operation only for a short time.

1276. Then ought you not on ordinary commercial principles to conclude from that that seeing that the price of meat has not varied, although that meat has been excluded, if that meat had been allowed still to come in, the price would have fallen?—The meat trade is one which it is very difficult to comprehend; it does not appear to be governed by precisely the same laws of supply and demand that other trades are. I am very much of opinion with Professor Brown that the labouring classes of this country, earning a good deal of money, will have even more meat than they really require, and that, on the contrary, when they earn very little money there is very little consumption of meat.

1277. Still, if there be any trade in the country, the prices of which are not affected by the exclusion of a considerable amount of supply, there must be something rather miraculous about it, must there not?—There is something which I have never yet been able to understand with regard to the difference between the wholesale price of meat and the retail price.

Mr. *Jacob Bright*—continued.

1278. With regard to Schleswig-Holstein, is that a scheduled country?—As part of Germany it is a scheduled country, or was so when Germany was in the schedule; but no animals will arrive from Schleswig-Holstein until about the month of June.

1279. In what position is Schleswig-Holstein now?—As part of Germany it is a prohibited country.

1280. Is it a non-transit country?—Yes, it is a non-transit country.

1281. Are not the cattle and sheep exclusively home-grazed there?—The cattle that are fed in Schleswig come chiefly from out of Denmark.

1282. Have we any reason to suppose that there is any connection between Schleswig and any country where the disease exists?—No; the cattle traffic is in the opposite direction from Denmark, into Mecklenburg.

1283. Is there any reason why we should not have free trade in cattle between Schleswig-Holstein and this country in cattle?—As an act of prudence, and knowing that Hamburg is so near to Schleswig-Holstein, I think it is better that Schleswig-Holstein should be dealt with as part of the German Empire, and that Germany being free from cattle plague, arrangements identical with those now in existence should be in operation to allow animals to come from Schleswig-Holstein here from June to November.

1284. Has there ever been a case of cattle plague in Schleswig-Holstein?—Yes, 100 years ago.

1285. But not in this century?—Not in this century that I know of.

1286. Does it not seem hard that we should be shut out from Schleswig-Holstein?—Recent arrangements did not shut us out from Schleswig-Holstein, and presuming that she was an unscheduled country altogether, she would export no animals but home bred ones; her animals are grass-fed animals.

1287. With regard to Holland, what is the position?—Holland is at this time a scheduled country.

1288. Is there any reason for that?—The cattle plague was very near her frontier, and it was considered that great risk was being run by allowing animals to come in from Holland as an unscheduled country; Holland consequently became a scheduled country.

1289. Has there been cattle plague of late years in Holland?—Yes, there was a considerable amount in 1865 and 1866.

1290. Has there been any since?—Since 1866 I do not think that Holland has suffered from cattle plague.

1291. Then if so long a period has elapsed since Holland suffered from cattle plague, and if Schleswig-Holstein has had no cattle plague during this century, would it not seem reasonable that they should be free?—I think that Holland is in too direct communication with Germany to allow of her being free.

Mr. *Assheton*.

1292. We have had one or two rather general propositions; I presume you will admit that loss and risk are not convertible terms?—Yes.

1293. And that though our loss from cattle plague in five years may have been only 20,000 *l.*, that does not represent our risk?—Certainly not.

1294. I forget

Professor *Simonds.*

17 May 1877.

Mr. *Assheton*—continued.

1294. I forget whether you offered any opinion as to the loss to the country by the cattle plague of 1865-66-67?—Yes, from 4,000,000 *l.* to 5,000,000 *l.*

1295. May I ask you whether in making that estimation that you estimate only the value of the cattle, or whether you also take into consideration the loss of time to the farmer, the loss through his not being able to utilize the produce of his farm, and the loss in money by his not being able to take his stock to market at the most favourable moment?—All those things are excluded from that calculation; it is a mere calculation formed upon the number of animals lost and their probable value per head.

Colonel *Kingscote.*

1296. How much is that per head?—I think about 12 *l.* per head.

Mr. *Assheton.*

1297. Were you connected with the Privy Council Department at the time of the 1865-66-67 outbreak of cattle plague?—Yes.

1298. Did you find that the farmers resisted the very stringent regulations that had to be put in force?—The farmers were exceedingly anxious to save their cattle, and to try all means of curing the disease, and the consequence was that we lost thousands of cattle which would have been spared, if we had had stringent measures which we could at once have put into operation.

1299. Does your experience on that point agree with mine, that the cattle-jobbers took a great deal more looking after than the farmers?—I can hardly say that they took a great deal more looking after. I think that a great many of the farmers, particularly in Cheshire, required a great deal of looking after.

1300. May I ask you whether you think that it is of the slightest use to inquire as to cures for cattle plague?—I do not think it is of any use.

1301. Are you aware of any preventives that have been at all efficacious?—No preventive measures that we know of are efficacious.

1302. I daresay you remember vaccination being tried?—Quite well.

1303. What was the result of that trial?—The result was that it tended to kill more animals than otherwise would have died from the disease by giving a false security, and leading people to suppose that they had something that they could rely upon as a preventive.

1304. The honourable Member for Manchester seemed to be of opinion, and I think you also agreed with him, that there would be sometimes a great glut of dead meat in the market, if a dead-meat trade were substituted for a live-cattle trade with continental ports; might not that be obviated, in a great measure, by the use of the telegraph, saying, "Do not kill any more for a week; we have plenty of dead meat"?—Yes, there is no doubt it could be obviated, and that the trade could be regulated to some extent by such means; but I think not to a sufficient extent; because the animals must be killed, and the meat must be cold and fit for export, before it could be put on the ship to be sent here; and, therefore, you would in many instances have to telegraph two or three days before; and you cannot tell what the state of the trade will be from one market day to the other, because the trade fluctuates so much, and is so uncertain.

Mr. *Torr.*

1305. You assert that if the German import of live stock was stopped, the same quantity would not come as dead meat; do you know that of your own practical knowledge?—Not from my own practical knowledge; but I think there can be no doubt that that would be the effect; there would not be the same quantity sent.

1306. You say that dead meat could not be sent so cheaply as live cattle?—Yes, and it could not be sold at a profit so well here.

1307. Have you had any practical knowledge of that?—I have practical knowledge with regard to dead meat never fetching so much as live meat in the market.

1308. Of course you are aware that the import of dead meat is quite a novelty, and we have only had 18 months' experience of it to any great extent, and that now it is so thoroughly understood that if you get a piece of dead meat that has come from America neither you nor I could tell the difference from the finest English beef?—Yes; but I will take the case of an English farmer, and perhaps I might go so far as to take my own case. Some few years ago I had a farm in the immediate neighbourhood of London, and I used to kill animals and send them up to Smithfield market, and I found that the system was not at all remunerative; but when I kept my animals on the farm, and had a man down to look at them, and we bargained for what they were worth, I found a very different state of things; I should imagine that the same principle would apply to the dead meat trade.

1309. Is not the import of cattle, dead or alive, from abroad entirely a matter of commercial enterprise?—It is not, perhaps, so much a matter of commercial enterprise as a matter of absolute necessity; we do not rear enough animals ourselves, and we must be aided by having more sent into this country.

1310. You said, in answer to the honourable Member for Manchester, that it could not be done so cheaply; have you had any experience of the relative cost of importing animals from abroad alive and of importing the meat that would represent those animals if they were brought in a dead state?—I have no personal experience of it whatever.

1311. Are you not aware that the facilities, means, and appliances for importing meat now are as different from what they were even two or three years ago as light is from dark?—I am aware that the facilities are greater, and that the appliances are better, but they are not sufficient, I think, to meet the case.

1312. Is it not fair to infer that if the 55,000 cattle were prohibited from coming from Germany and Belgium, a very large proportion of those animals would come in the shape of dead meat?—A large proportion would come, no doubt, as dead meat; but I believe, as I have already stated, that we should not have anything like the same amount of meat sent in as would be sent in as live animals.

1313. Then it is only an impression upon your mind, and you have no information upon the matter?—No, I have not. We should lose also hides and horns and hoofs, and things of that kind, if we had the animals killed on the other side of the water.

1314. The questions that have been asked you, I think, refer to the supply of meat to the people of

Mr. *Torr*—continued.

of this country, and the argument against stopping the imports from Germany and Belgium is, that you would thereby diminish the supply of meat for the population of this island. Your profession being that of a veterinary surgeon of very great eminence, that, I presume, is scarcely a question that you would have answered with the confidence with which a man of practical mercantile knowledge would be authorised to answer it; as you have had some experience of farming, I imagine that the first aim of all farmers is to produce the largest amount of food for the people; one farmer produces it in corn and another in meat; do you think that the exclusion even of 55,000 head of cattle from Germany and Belgium would have a greater or a less effect upon the supply of meat of this country than the exclusion of the periodical disease, which would affect the millions of animals of this country?—The introduction of the disease, I hold, does not materially increase the disease already existing in this country. We deal with diseased animals at the port, and we sacrifice the whole of them, and it is evident than when we have been introducing the largest number of diseased animals from the continent, we have had the fewest animals affected with the disease here; and it is also true that when we introduced no animals from abroad at all, foot-and-mouth disease was more, or quite as much, diffused as it ever has been since, and that our losses were equally heavy.

1315. But the point before us, upon which you have been principally questioned, is the stopping of the supply of animals from Germany to prevent the introduction of cattle plague; both you and the previous witness have said that we have foot-and-mouth disease, and that unless we adopt very stringent measures indeed at home, as well as abroad, we could not stamp it out; but so far as cattle plague is concerned, both you and the preceding witness say that we owe that cattle plague entirely to imports?—Yes, we do, entirely; and we have had no serious loss from cattle plague since 1865-67. We had one small loss from cattle plague in 1872, and we have now to add the present loss.

1316. Do you think that it would be an onerous cost to impose upon this country, if by stopping the 55,000 head of cattle from Germany and Holland we could prevent the recurrence of that cattle plague, simply looking at the question as a matter of food?—Looking at the frequency of the introduction of cattle plague, I think that it would be a serious loss.

1317. What would be a serious loss?—The stopping of those animals from Germany.

1318. Would it be at all an equivalent if by that means you could escape the recurrence of cattle plague, taking the two points together?—It is a matter upon which I am not prepared to give a decided opinion; as coming before me for the first time, I have not sufficiently considered it.

Sir *Rainald Knightley.*

1319. Did I correctly understand you to say that the dead meat was capable of communicating the cattle plague?—Undoubtedly.

1320. To cattle?—To cattle.

1321. Have you ever known a case of it?—Yes, several.

1322. And sheep also?—Yes, and sheep also.

1323. But cattle plague has never been communicated to this country, so far as you are aware, either by dead meat or by sheep?—No; it never has been imported into this country either by dead meat or by sheep, but in this country there were many cases of cattle plague which were due to animals being exposed to the flesh of animals that had been either killed or had died of cattle plague.

Sir *Rainald Knightley*—continued.

1324. But is it not very difficult to prove that the disease is communicated by dead meat; if the disease was very prevalent all over the country at the time, how could you prove that the disease was communicated by dead meat where there were live cattle at the time suffering from the disease?—I will give you one instance which occurred in the county of Essex, when the cattle plague was nearly exterminated from that county; I am not aware that at the time I allude to the cattle plague existed within 15 or 20 miles of the place. A person bought some sheep in Colchester market; those sheep had been exposed to cattle plague, but they appeared to be healthy at the time he bought them; he sent them over to his farm, within six or seven miles of Colchester, and put them into his pastures. A day or two afterwards some of the sheep were found to be ill; the ill sheep he took up on to his farm premises, not knowing what the sheep were suffering from. He had several calves upon his farm premises, and within about five or six days of bringing the unhealthy sheep on to the farm premises the calves were taken ill. The first calf which was taken ill he thought possibly might be sold for food, and sent to London, as is a common custom; and he sent for a village butcher close by. The village butcher took the calf and killed it, but after it was killed it was found to be of so bad a colour (to use their expression) that it was not saleable. It was not known at that time that the calf was affected with cattle plague. Another farmer, living in an opposite direction, went down to the village, bought part of this calf as food for his dogs, took it home and hung it up near to where his cows were; cattle plague was thus communicated to his cows and he lost them all.

1325. You imagine that the sheep gave the cattle plague to the calf?—Undoubtedly.

Chairman.

1326. I understood you, just now, to say that the rinderpest had not existed in Schleswig-Holstein during the present century?—No, not for quite 100 years, I think.

1327. Is Altona considered to be in Schleswig?—Altona is in Schleswig-Holstein, Schleswig being north, of course, of Holstein.

1328. Has there not been cattle plague in Altona?—Yes, I think there was cattle plague in Altona in 1872; but when I spoke of Schleswig, I did so as being north of Holstein.

1329. The honourable Member for Manchester was questioning you as to the safety of the import of Schleswig-Holstein cattle, and you stated, in answer to him, that there had not been, during the present century, cattle plague in Schleswig-Holstein; I think that in 1872 there distinctly was cattle plague in that country at the port?—There might have been at Altona, but Tonning is at a considerable distance from there, and I was speaking with reference to Tonning.

1330. It would not be correct to represent the country as distinctly free from cattle plague under

Professor *Simonds.*

17 May 1877.

Chairman—continued.

under those circumstances?—No; we might represent Schleswig as being perfectly free from cattle plague, but not the port in Holstein.

1331. But you would not make any difference in your regulations between Schleswig and Holstein?—No, certainly not.

1332. Because they are both grazing countries dealing with the cattle of Denmark, for the purpose of fattening them for the English market?—Yes, that is so.

1333. Therefore it is only fair to say that there is the risk or that there has recently been the risk of cattle plague being introduced from Schleswig-Holstein through the port of Altona?—Yes.

Chairman—continued.

1334. Are you aware also that the port of Altona was subject to cattle plague on the present occasion?—I was not aware of that.

1335. That would modify your view, and make it, in your opinion, more necessary to restrict in some way the import of cattle from that country, would it not?—Yes, that has been the view acted upon with regard, to Schleswig-Holstein being until now they were scheduled countries.

1336. I only ask you that because the question of the honourable Member, and your answer, seemed to imply that Schleswig-Holstein might be treated as a free country like Denmark?—Just so.

Monday, 4th June 1877.

MEMBERS PRESENT:

Mr. John Holms.	Colonel Kingscote.
Mr. Anderson.	Mr. M'Lagan.
Mr. Assheton.	Sir Rainald Knightley.
Mr. Jacob Bright.	Mr. Pease.
Mr. Chamberlain.	Mr. Arthur Peel.
Mr. Chaplin.	Mr. Ritchie.
Mr. James Corry.	Sir Henry Selwin Ibbetson.
Mr. Elliot.	Mr. Torr.
Mr. E. Forster.	

SIR HENRY SELWIN IBBETSON, BART., IN THE CHAIR.

Professor CHARLES MÜLLER, called in; and Examined.

Chairman.

1337. YOU are, I believe, Professor of Anatomy in the Berlin Veterinary College?—I am.

1338. And you are a member of the Veterinary Department of the Prussian Agricultural Ministry?—I am one of the six ordinary members of the Prussian Veterinary Department.

1339. As such have you been consulted as an expert in all cases relating to cattle plague since 1866?—I have.

1340. You are here, I believe, not at the desire of the German Government, but accidentally?—Accidentally. I am here in no official character, and I can only give evidence as a private individual; but, as a member of the Veterinary Department of Prussia, I know well all the regulations which were adopted on the last occasion against cattle plague, and also I know sufficiently the intentions of the Prussian Government.

1341. Can you describe to this Committee what the Veterinary Staff in Germany consist of?—There are in Prussia veterinary officers appointed by the Government, who have the quality of officials in every circle, and, perhaps, we have between 420 and 450 circles in the Prussian kingdom. Every circle has such a veterinary officer. In a few cases only, for two circles there is only one veterinary officer.

1342. As I understand you, these circles are districts of country entrusted to one of these veterinary inspectors?—That is so. There are exceptions, but very few exceptions, where two circles are entrusted to one veterinary officer. Those veterinary officers are paid by the Government, but they have only a small pay.

1343. I suppose that that represents a sort of retaining fee for their services?—Yes; only they must do their services gratis in the town or in the place where they are living. When they go out of that place only for a short distance, they get a fee, and they are well paid for all their services. In order to obtain persons who are more to be trusted and more to be relied upon, the Prussian kingdom pays a larger salary to those veterinary officers who have the circles on the eastern frontier from Memel, on the Baltic, to Upper Silesia.

Chairman—continued.

1344. There is then a difference between the veterinary inspectors in the interior of the country and those who are stationed in the circles that touch upon the frontier?—There is a difference, but there are common veterinary officers also in the border circles; they have only a greater salary than others. In the border districts, I believe, in the last two years, the Prussian Ministry has named officers, who are only for veterinary police, who have no practice, and who are forbidden to practice; they receive from the Government a salary high enough to enable them to live upon it without any practice; and those officers have only the duty of seeing that no cattle plague and other contagious diseases are introduced. Very often, by order of the Government, they made journeys in the kingdom of Poland to see how the cattle plague is spreading itself in Russian Poland. They are to say it in one phrase, not practically veterinaries; they are veterinaries with the quality of police officers.

1345. They are veterinary detectives, in fact?—Yes. The Polish information is not to be relied upon, and, therefore, the Prussian Government has named special veterinary officers to give all their attention to the cattle plague, and to the introduction of contagious diseases from Poland to Prussia.

1346. That is in consequence of that frontier being the most liable to the outbreak of cattle plague?—Yes; and also on the Austrian frontier it is the same, and I believe there are now six or seven such veterinary inspectors, who are only for the purpose of veterinary police.

1347. Has that system been long established, or is it a new introduction?—It is a new introduction since about 2½ years. We have higher veterinary officers in each Government, and in the highest instance there is the Veterinary Department in Berlin. We have three instances for veterinary questions, the veterinaries of the circle, the veterinaries of the Government, and the highest is the Veterinary Department in Berlin.

1348. They are all in communication with each other, but the staff on the frontier are working

Professor *Müller.*

4 June 1877.

Chairman—continued.

ing as a police under the central Government?—Yes, under the Government of Prussia, not under the Government of the Empire; it is a Prussian institution.

1349. Will you describe to the Committee what are the regulations now in force on the Prussian frontier with reference to the prevention of the introduction of cattle plague?—As regards the regulations to prevent the introduction of cattle plague from Poland and from Austria into Prussia on the eastern frontier, I must make a difference between those measures which had been in force until the last outbreak of cattle plague, and those measures which have been adopted since, because we have learned new experiences by the last outbreak.

1350. Will you kindly state to the Committee what the regulations were before the cattle plague last broke out?—The measures which were in force before the last outbreak of cattle plague were, shortly, the following:—All importation of cattle from Russia has been prohibited since 1871, but in 1871 a mistake was made in that; the introduction by sea on the Baltic was not prohibited, and that was the cause that Russian cattle brought cattle plague through Germany to England in the year 1872. From 1871 to 1872 the introduction of Russian cattle was prohibited in Germany and in Prussia, and it is the same, because Prussia is the only country in Germany which has a frontier towards Poland. In 1872, cattle were brought by sea from Cronstadt to Lubeck on the Baltic, and they were brought from Lubeck to Hamburg on the railway, because by that way they avoided going through the Cattegat and around Tirtland, and these Russian cattle in 1872 brought the cattle plague to England, to Hull, as I believe. Therefore, in 1872, the importation of cattle was prohibited from Russia by sea, and since that time no cattle from Russia have gone to Germany and to Prussia by a lawful way.

1351. In fact, the cattle that produced the disease on this occasion must have been smuggled?—Yes, they must have been introduced into Prussia by an unlawful way. That is, as to the Russian frontier. On the Austrian frontier we have also the regulation since 1871, that no cattle are permitted to be introduced belonging to the grey steppe race. We call it the grey race because all the several races of the steppe cattle in Galicia, in Hungary, and in Russia, &c., are of a grey colour; it is a different nuance of grey.

1352. The grey oxen have been forbidden since the same date at which the frontier of Russia was closed?—Since 1872. I do not know whether the regulation is of the same date. I know only that it was forbidden a year before.

1353. Will you be able to put in a copy of the decree or law which prevented the introduction by sea of Russian cattle?—Yes. I have not it in London, but I will send it from Berlin.

1354. With regard to the Austrian frontier, were the cattle allowed to come in there with the exception of these grey oxen?—Yes, but under certain restrictions, some of which I have noted down here, and I can translate them. From Russia all importation of cattle is prohibited. From Austria is prohibited the introduction of all cattle belonging to the grey or to the steppe race. But now I must mix new measures and old measures. The Russian frontier runs from Memel

Chairman—continued.

on the Baltic to Cracow, as you can see on this map; and all along the Russian frontier no cattle can be introduced into Germany; all cattle are prohibited from Russia. From Cracow we have a long frontier line against Austria, in Silesia, in Saxony, and in Bavaria; and along all this frontier there is a regulation against the introduction of the grey oxen. This is not a Prussian regulation; this is a regulation of the empire; and it must be a regulation of the empire, because it is also in force on the Saxon and Bavarian frontiers, where the Prussian ministry have nothing to say. So on all this long line of frontier against Austria it is not permitted to introduce any cattle belonging to the grey or the steppe race, and it is only permitted to introduce cattle of other races under the following restrictions:—It must be proved by certificates of the Austrian authorities that those cattle have not been, within the last 30 days, in any place belonging to Galicia, to Bukowina, or to the lands of the Hungarian crown. The law is that cattle can only be introduced if they are brought from the other provinces of Austria on certificates that the cattle have been in the last 30 days in a place other than in all the districts that I have named. The second condition is that they must be brought with certificates from the Austrian authorities, that in the place where those cattle were fattened or fed there is no cattle plague within a circle of 135 kilometres.

1355. You mean that the Committee should understand that with regard to the introduction of these cattle across the frontier, they must be accompanied by a certificate showing that they have been for a given time within a particular area without disease?—Yes; and in particular provinces of Austria; and that the transport of such cattle goes through districts which are not infected. That is the second condition. The third condition is that the cattle must be examined on passing the frontier by a veterinary inspector of the Saxon, the Bavarian, or the Prussian Government.

1356. By one of the local inspectors?—Yes, by an inspector appointed by the authority. There are no differences between the introduction of cattle from Russia, and the conditions under which Austrian cattle can be introduced in the German Empire.

1357. Are those all the regulations that existed before the outbreak?—They were, and they are also in force in the present time.

1358. Would you now kindly tell the Committee what was done after the outbreak in consequence of it?—After the outbreak, our vigilance on the frontier line has been much strengthened; we have now a greater number of veterinary inspectors, and armed policemen, who have orders to keep watch that no cattle are imported in an unlawful manner across the frontier, and also all the customs officers on the frontier have orders to keep their eye open upon the movement of cattle. We have now on the whole frontier, from Memel to Cracow, and also on the Austrian frontier, what we call in German "Cattlecataster." There is in every village a list of cattle taken, and the proprietor of the cattle must give notice of any change in his cattle; if he is selling the cattle, or if he is buying the cattle, or if the cattle are dying, or if they are slaughtered, he must give notice of it, and the list is rectified by these notices.

1359. You

Chairman—continued.

1359. You have really a census of the cattle all over the districts?—Yes, that is the word for it. All changes in the position of the cattle must be announced to the authority, and there are some officers who are not paid, who hold an honorary post, and whom we term revisers, who have to control all these lists, and by these lists we can now find out if any cattle have got unlawfully into the possession of the proprietors.

1360. Does that census of cattle apply to the whole country, or simply to a border ground?—Only to the border. During the outbreak of the cattle plague it was an institution in all the country, but now that the cattle plague has been stamped out in Prussia, it is only an institution in force on the border.

1361. Is it proposed for the future to maintain a zone round the frontier in which a census of the cattle is to be continued?—As far as I am informed, this institution will be retained as long as there is a peril from Poland; and this period will last for a long time, because the Russian army is now on the march, and it is always experienced that when the Russian army is marching cattle plague is following the army. Then we have also a new measure prohibiting the import of all cattle and of all sheep in a particular district of Silesia. In the government of Oppeln (which you call in English Upper Silesia), no cattle and no sheep and no goats can be brought across the frontier. In Silesia there are three governments: Breslau, Liegnitz, and Oppeln; Oppeln is the most perilous part of Silesia, because on the one side it has Poland, and on the other side Austria. The province of Posen divides Lower Silesia from Poland. It is necessary to prohibit the introduction of all cattle from Austria into Upper Silesia because there is a great number of railways, and we fear that Russian cattle will come by railway through Austria to Silesia.

1362. Do you allow cattle to be trucked on the frontier and taken through your country?—No, that has been stopped.

1363. Is that one of the new regulations?—It has been stopped from Poland since 1871, and from Austria it was only allowed under the restrictions which I have named; and now, in the government of Oppeln, in Upper Silesia, no cattle can be introduced.

1364. That is to say, they must be driven a certain distance before they can be put upon the railroad for transit?—That is another measure, and I have here the Order. We call it a Circular Order from the Minister of Commerce and the Minister of Agricultural Affairs, and this I can hand in. It is an Order from the Prussian Government to prevent the introduction of smuggled cattle; that in a certain district, called a zone, no cattle shall be loaded in railway carriages. (*The Witness described the zone to the Committee upon a map.*)

1365. That zone, as I understand you, represents the line which separates the country where cattle can be placed upon the railroads from the frontier over which they cross?—Yes; I have marked with pins the line of the stations nearest to the frontier where it is allowed to load cattle in railway trucks, under certain restrictions which I will state. In the district bordered on one side by the frontier line, and on the other side by the line of pins which I have stuck in the map, no cattle can, under any conditions, be loaded on railways. The first stations where cattle can be loaded at are those stations which I have marked with the pins, and here, also, it is only allowed to load cattle in railway trucks by special permission given by the administrative head of the circle; the Landrath (so this head of administration is called) has instructions to give those permissions only to great landowners, or to persons in his own circle whom he knows personally, and to persons whom he is convinced can be trusted.

1366. That is an additional safeguard beyond the fact that you have to drive the cattle under the eye of your inspectors for a certain distance before they can be put upon the railway?—Yes, but this measure which I have sought to explain gives us the hope to stamp out smuggling; our difficulty lies in the smuggling of cattle. The great attraction to smuggling is the winning of money, and the greater is the difference between the price of cattle in Poland and in Prussia the greater will be the attraction to the smuggling of cattle. The more the regulations tend to lessen the winnings of smugglers, the more easily smuggling will be kept down. Now, if we force a smuggler to transport the smuggled cattle, say 25 or 30 English miles, then they will lose so much that smuggling will not pay, and by driving these cattle through the border districts, there will often be an opportunity to detect the smugglers, and we believe that by these measures we shall, in process of time, keep down smuggling.

1367. What do you do with that particular zone district with regard to the cattle that are within the district itself?—They must also be transported to the first station where the loading of cattle is permitted under the restrictions I mentioned above.

1368. Is a permit required with them also before they are allowed to go on the railway?—Yes, they must have a permission from the administrative head of the circle; but from that line to the interior there are no restrictions on the loading of cattle in railway trucks. It is only in these border stations where a special permission is required; at all the other stations inland from this line the loading is free. I must now draw the attention of the Committee to another measure which will take place, and which, I believe, will give the best protection both to our own land and also to foreign countries. We cannot deny that we have not given our attention enough to the cattle markets in the great towns, and with our numerous railways very often cattle plague spreads itself from these markets with great quickness in the land; therefore it is now ordered that when the first case of cattle plague is found out in the border district, say in a village in Upper Silesia, the same day all cattle markets will be closed for export; that is to say, on the same day when it is announced in Berlin that cattle plague is in the border district, on that same day any cattle will be prohibited from going from the cattle market in Breslau, from the cattle market in Berlin, from the cattle market in Hamburg, and from the cattle market in Dresden.

1369. You propose, in fact, to close all markets on the announcement being made to the central authority that there has been a case of cattle plague detected?—Yes, on the same day; but only the markets for slaughtering purposes. I

Professor *Müller.*

4 June 1877.

Chairman—continued.

am sure if this measure is taken, it is quite impossible that cattle plague can go through the land as it did in the last outbreak.

1370. Would you place any restrictions upon cattle going through the country for store purposes?—No; we put no restrictions upon the markets in the little towns where only store cattle are bought and sold. Only in the vicinity of the infected village, in a circle bounded by a periphery of 20 English miles, no cattle-fair, or market can be held.

1371. I believe your last outbreak arose from what you have described as smuggled cattle?—From smuggled cattle.

1372. That was across the Polish frontier, was it not?—On the Polish frontier, in Upper Silesia, in a great mining town called Beuthen.

1373. And it was not discovered for some little time?—It was not discovered for some little time; it was between, I believe, four and five days.

1374. Those cattle which were smuggled across had been moved to several of your towns before it was discovered, had they not?—They had been moved to Breslau.

1375. All that had taken place before the central authority had become aware of it?—Before the authority had detected the outbreak of cattle plague; and between the day of the smuggling and the day when the cattle plague was detected in Upper Silesia, the infected cattle had gone to Breslau market, and had spread it from the Breslau market to Berlin.

1376. And then the cattle had gone from there to Hamburg and to Berlin, and that was the origin of the outbreak in this country?—Yes.

1377. But all this time the central authority were unaware of the outbreak?—They knew of the outbreak in Silesia, but they did not know that infected cattle had been going from Silesia over the country. It was not the smuggled cattle that had gone directly to Berlin, but it was cattle that had been in contact with the diseased smuggled cattle.

1378. How is cattle plague dealt with in Germany by the central authority?—The law to stamp out cattle plague is a law of the Empire. It is under the regulations of the German Empire, and not under the regulations of single States.

1379. On whom does the cost of carrying out the regulations fall?—It is all paid out of the Treasury of the Empire.

1380. What is your mode of dealing with cattle plague, on an outbreak being discovered?—If an outbreak is discovered, all cattle that are diseased, and all cattle that have been in contact with diseased cattle, are killed by order of the authority, and the owner is paid compensation to the full value of the cattle.

1381. Of all that are diseased?—Yes; the common value per head; that is to say, the value that it will have under any circumstances. It may be, for example, that a bull may have a great breeding value, but the breeding value we do not pay for.

1382. It is the direct market value for food?—It is the direct market value for food; and for a milking cow also, the value which a milking cow will have in the market is paid.

1383. Do I correctly understand you to say that in this compensation they do not take into consideration the fact of an animal being of a particular class or breed?—We do not pay for that. We call that breeding value, and we pay only the common value.

Chairman—continued.

1384. You pay a uniform value according to the market prices of the animal?—Yes, what it will fetch in the market.

1385. Apart from its particular value?—Apart from its particular value for breeding. The Treasury of the Empire also pays for all costs for disinfection, and for the burying of the animals.

1386. Have you any particular regulations with regard to burying the diseased animals when slaughtered?—They are buried so that they are covered two metres with earth. Healthy cattle may be consumed occasionally as human food, but that is only allowed, it is not ordered; it is under the responsibility of the officers. In great towns and in slaughtering houses under the surveillance of the police, healthy cattle, which have only been killed because they were in contact with diseased animals, may be used for public consumption.

1387. When an inspector certifies that they may be so killed, cattle which have been in contact with diseased animals, may be used for human consumption?—Yes, but only in great towns and in slaughtering houses under the superintendence of the police.

1388. In great towns do they bury the diseased animals on the spot?—Yes, on the spot.

1389. The cost, as I understand you, in all cases falling upon the Imperial Government?—Upon the Imperial Government.

1390. Is the compensation the same for the cattle which are slaughtered for having been in contact with the diseased animals, as it is for the diseased animals themselves?—It is quite the same; and the cattle that have died from the disease are also paid for with the full value.

1391. All are paid for at their full value?—At their full value.

1392. Besides the veterinary inspectors on your frontier, where cattle plague exists, you draw a cordon of soldiers around the frontier, do you not?—Yes, when cattle plague has broken out in the border districts of Poland or Austria.

1393. And they are assisted also by your customs officers, are they not?—By the Custom House officers in ordinary times; but if cattle plague in Poland and in Austria is nearing the Prussian frontier, there is a military cordon put upon the frontier; and if cattle plague breaks out in a village, it is the rule to put a cordon of soldiers around the village, another around the infected premises; but the village or the premises may also be guarded by civil guards, like the gardes champêtres, by the peasants themselves, and in this case, if the peasantry do supply guards to close the village and the premises, then the community must pay for the guards.

1394. Then there is a charge that does fall upon the locality?—Yes; and also the little houses for disinfection must be paid for by the local authority.

1395. But the actual cost of the disinfectants and the actual cost of the slaughter, is paid from the Imperial Treasury?—Yes, in the same manner also, the expenses for the military cordon.

1396. I suppose, in your opinion, there is great difficulty, is there not, in discovering the first cases of this disease in your markets?—There is the greatest difficulty, in the first place, to discover it in the markets for slaughtering purposes.

1397. It

Chairman—continued.

1397. It is easier to detect it in the living animal than it is in the dead carcase, is it not?—My opinion is that it is more easily detected in living animals than by a post-mortem examination.

1398. You agree, then, with Professor Brown in his opinion that the post-mortem examination does not always indicate the disease?—The post-mortem examination gives us only a greater security if we have seen before the same cattle in a living state. If I can see the symptoms in the living cattle, and then make a post-mortem examination, it will be a greater security to give a right diagnosis.

1399. But your best proof, then, is really in seeing the spread of the disease?—Yes; we must take it altogether, and I will never throw a stone at a veterinary inspector who does not judge rightly on the first case. It is very difficult to judge rightly on the first case, and especially in the slaughtering markets, because in the slaughtering markets a great number of oxen will be killed in the same day, or on the next day after their arrival, and they may be in the first stage of the disease, showing no very marked symptoms, and they are able to infect other cattle.

1400. All this makes it very difficult to draw up regulations that will give you security on your frontier?—The greatest security for our frontier will be the district on the border where no smuggled cattle can be loaded in railway trucks, and the strict supervision of the cattle in our border districts. The best means to prevent the propagation of the cattle plague out of Germany will be that all exportation markets will be closed on the first day when the first case of cattle plague has been found in the border districts. That, I believe, will be the greatest security.

1401. Are you at all contemplating dealing with the cattle on your frontier as the British Government have dealt with cattle at Deptford, by setting up a slaughtering market there?—If I understand you rightly, you ask if we have not the intention of making a regulation on our frontier similar to your regulations at Deptford. We have such a plan, because, as I have told you before, Upper Silesia is a great mining district, producing no food, but only consuming; the whole district is like a great town. In all the districts of Upper Silesia, and on the right side of the River Oder, the people live as it were in a great town; there is no sufficient agricultural production at all; and therefore it will perhaps be necessary in future for the purpose of feeding this population, to get some meat from Poland and Russia. Therefore it is the intention to build great slaughtering houses on the frontier, and there to allow the slaughtering of Austrian cattle under veterinary inspection, so that this meat may be eaten by the people in the mining district; but we believe that it will be a very long time before all these intentions are put in force.

1402. This is only an intention?—It is only an intention.

1403. With regard to this last outbreak at Hamburg, at present, I believe, that there is some sort of international understanding between the Governments about telegraphing outbreaks mutually to each other, and this outbreak in Hamburg was not detected until the 13th, was it?—In the evening of the 13th of January.

Chairman—continued.

1404. No telegram arrived in England until after the animals arrived; was there any mistake with regard to that telegram?—There was a mistake, and it was also a misfortune, if one may so term it. The veterinary inspector in Altona saw the first cases of cattle plague in the evening of the 13th, and he did not give positive judgment about the case, but only said, "I suspect that it may be cattle plague." On the Saturday evening this opinion of the veterinary surgeon was telegraphed to the Government in Schleswig, and on the Sunday morning, which was the 14th of January, the cattle plague was discovered in Altona, and then the police inspector in Altona telegraphed to the Government on the morning of Sunday.

1405. So that, in consequence of its being Sunday, there was a delay?—There was a delay in consequence of its being Sunday, and the telegram was sent from Schleswig to Deptford on Monday morning.

1406. That is a condition of things which makes it very unsafe to export cattle?—Yes; it is also felt that it was a mistake, and, therefore, I know for a certainty that it is the intention of the Prussian Minister that in future all outbreaks of cattle plague will be telegraphed from the spot here to the Privy Council, or to any English office you may name, and not by the Central Government, but by every local authority. Every local authority is in future to telegraph each outbreak of cattle plague directly to the Privy Council, or to such office as you may name.

1407. Is that an order which has been already issued?—It is already given, or will be given in the next time.

1408. Have you a copy of that order here?—I have not, because I have not come here with the intention of giving evidence; but I will procure it, and put it in the hands of the Committee.

1409. By that means, in future, we may hope to get an earlier instruction of any outbreak in your country?—I am sure you will have it on the day of the first outbreak.

1410. Can you give the expenses of the last outbreak of cattle plague, separating them into the expenses for compensation and the expenses for disinfection?—As those expenses are not yet accounted for, I can give only an estimate of them. I have here a paper which I have sent to the Privy Council, containing our losses by cattle plague, and from it I can give you the number of head of cattle. There were 1,260 head of cattle killed, 321 sheep, and 9 goats.

1411. Was that during the three months in which the cattle plague continued in Germany; January, February, and March?—Yes, it is the whole loss that we have had in the recent outbreak. We had an outbreak of cattle plague in 47 places in 180 premises, and there died, or were killed by order of the authority, 1,260 head of cattle, 321 sheep, and nine goats. There were killed and left for human consumption 69 head of cattle and 16 sheep.

1412. Those were allowed to be sold for food?—Those were allowed to be sold for food. That was in Hamburg and in a place of Saxony (Chernnitz).

1413. And the others were killed and buried?—The others were killed and buried. You may say that now the value of a head of cattle will be, on the average, 300 marks; and you must remember that under the new German currency

Professor *Müller.*

4 June 1877.

Chairman—continued.

a mark is exactly equivalent to the English shilling.

1414. That is about 15 *l.* a head, then?—Yes, on the average; and we may reckon that the expenses for disinfection will be the same as for the cattle that were killed.

1415. You mean that there will be an amount of 15 *l.* a head for disinfection?—The expenses generally. I take an average 15 *l.* per head of cattle, and if I multiply that by 1,260, that will be the sum paid for all the other expenses including disinfection.

1416. So that if 15 *l.* is the average, double that amount per head is what the average cost of the outbreak to the Government was?—Yes.

1417. In that cost, is the destruction of buildings included?—All costs, and also the cost for burying.

1418. In that outbreak you had a very large number of premises which had to be paid for, had you not?—A very large number. The greatest number of premises destroyed was in Altona, because the peril was the greatest there. The premises in Altona were not premises for store cattle, but were premises for the cattle trade, and it was very perilous to have infective matter in such premises.

1419. In your experience, have you found that sheep convey cattle plague?—I have seen it once. In the war against France, in 1870 and 1871, we had cattle plague in Western Germany and also in France; France suffered much from cattle plague during the war, and I have seen cattle plague in sheep in Alsace and Lorraine in France; but it is comparatively seldom that the sheep suffer from cattle plague, although they may of course suffer from cattle plague as every ruminant may. In 1865, when cattle plague was so much spread in England, very costly and expensive gazelles and other animals of the ruminant tribe in the Jardin d'Acclimatization in Paris also caught cattle plague and died.

1420. Therefore, in your opinion, though sheep may carry the disease, they do not often spread it?—They may carry the disease and they may spread it, but it is very seldom that that happens.

1421. Looking at all these precautions that you propose to take, have you considered the question of the continued export of live animals to this country from Germany?—I believe that it can be continued without great peril, for you see we are learning by every outbreak, and all the mistakes that have been made will be avoided, I believe, in future. The greatest mistakes that were made in this last outbreak of cattle plague were, in the first case, that the German authorities telegraphed a little too late, and that the examination of the cattle that were brought over by the "Castor" was perhaps made a little too superficially. Therefore the two veterinary inspectors have been put under trial, and the Prussian inspector has been punished, and has lost his situation.

1422. The man who inspected the cattle before they were placed on board the "Castor"?—Yes; and the Hamburg veterinary inspector, so far as I am informed, is not yet punished, the trial being till now not finished; but in Prussia the inspector is already removed from his place; and in future the examinations in Altona will be put under veterinary inspectors who can be relied upon.

Chairman—continued.

1423. I understand you to say that, in your opinion, the importation under these new regulations might safely be continued for slaughtering purposes?—For slaughtering purposes.

1424. The animals being sent to Deptford?—To be sent to Deptford; and I believe also, with the same exception in favour of Schleswig-Holstein; for in Schleswig-Holstein there are many circumstances which give the greatest security against any cattle disease.

1425. You mean that Schleswig-Holstein, from its being a grazing country, protects itself very much against cattle plague?—It completely protects itself, because all the circumstances are such that Schleswig-Holstein has ever been free from cattle plague.

1426. Leaving cattle plague, would you tell the Committee what regulations there are in your country with regard to pleuro-pneumonia?—In Prussia, pleuro pneumonia is dealt with in a similar manner to cattle plague. There are many places in Prussia where you have pleuro-pneumonia every year, and then again you have provinces where pleuro-pneumonia is very seldom to be found. I have before me the Report from the Veterinary Department as to the spreading of contagious diseases among animals, and in the last quarter of last year there was no pleuro-pneumonia in Berlin, in East Prussia, in two governments of Pomerania, in Schleswig-Holstein, and in a great part of Hanover; but we have also a province where we have great losses by pleuro-pneumonia, and that is in the vicinity of Magdeburg.

1427. Do you treat pleuro-pneumonia in the same way as you do cattle plague, that is to say, slaughtering animals?—Slaughtering the animals, but only the diseased animals.

1428. What regulations have you with regard to those animals that are in contact with the disease?—They are put under a sequestration; they are shut in the stables.

1429. For how long?—Till three months after the last case of the disease.

1430. They are kept in quarantine for two months before they are allowed to move about? They are kept in the stables; they are not allowed to go free in the fields.

1431. And you think that is a sufficient protection against their carrying the infection?—I believe so; three months is the minimum time.

1432. In your opinion, as belonging to the Veterinary Department, does that give security as against the spreading of the disease by those animals?—I believe so, because all that are diseased are killed on the spot, and because in the next six months after, cattle from the infected premises can be sold only for slaughter.

1433. Is the compensation with regard to pleuro-pneumonia in your country dealt with in the same way as with regard to cattle plague?—No, it is quite another matter.

1434. What amount do you pay in the case of killed animals?—In the province of Saxony we are paying the half, and in all the other provinces we are paying four-fifths of the value.

1435. How is that raised; is it raised on the locality by a rate?—By a certain rate. We have provincial parliaments, *Etats de province*, or *Etats généraux*, quite the same as in the French departments, and they are raising a tax of, say, a penny, or a halfpenny for every head of cattle.

1436. Can

Chairman—continued.

1436. Can you give the Committee the reason that has caused the distinction as between cattle plague and pleuro-pneumonia, that in the one case you make it a charge upon the imperial funds, and in the other case you make it a charge upon the local funds by a rate?—Because the veterinary law against pleuro-pneumonia and other contagious diseases is not a law of the empire, but is a law of Prussia.

1437. Then it is a law that you do not apply to the whole empire?—It is a law of the kingdom of Prussia only, and not a law of the empire.

1438. I suppose you enforce by penalties the carrying out of this law?—Yes, there are penalties if the tax is not paid. It is a rate paid upon every head of cattle. There is a fund collected, and from this fund is paid the compensation for cattle killed to stamp out pleuro-pneumonia.

1439. Do I correctly understand you to say that what you describe as the regulations with regard to pleuro-pneumonia are the regulations of Prussia alone, or do they apply to the whole of the empire?—To Prussia alone.

1440. Are you aware what the regulations are as to pleuro-pneumonia in the other parts of the German Empire?—I am not much informed about it.

1441. Have you tried inoculation with regard to pleuro-pneumonia?—We have tried it, and it is also much in force in Saxony. In the district of Magdeburg there are a great number of sugar fabrics for manufacturing sugar from beetroot; and all those great manufactories have a great number of oxen; they change their oxen every year once or twice, and therefore they have always pleuro-pneumonia, and they are inoculating it. But in all the other provinces they are not fond of inoculation; it is not the custom to inoculate much.

1442. Do you yourself believe in inoculation as a prevention of pleuro-pneumonia?—I am against inoculation, but there are many men of high position in the profession who are great friends of inoculation. It is a party question.

1443. As I understand from your evidence, at least as far as Prussia is concerned, there is a very large amount of pleuro-pneumonia, and no means of absolutely stamping it out have been adopted?—We are now hoping to stamp it out, because we are killing every diseased animal, and because we have shut our frontier against the import from the Netherlands.

1444. And you believe that by closing your frontier against import and by slaughtering the diseased animals, you will be able to stamp out the disease?—Yes, because we constantly have had pleuro-pneumonia again from the Netherlands. We have store cattle and milking cows from the Netherlands, and the Netherlands are the hotbed of pleuro-pneumonia.

1445. With regard to foot and mouth disease, does that prevail to any great extent in Germany?—Yes; but there are no very stringent regulations to stamp out foot and mouth disease, for we are of opinion that the means of stamping out would be worse than the disease itself.

1446. You mean to say that you believe that to stamp out foot and mouth disease the restrictions would be so severe that they would not be tolerated?—They could not be tolerated. We receive foot and mouth disease time after time from Russia and from Poland by pigs. There is a great trade in pigs from Poland to Prussia, and by that means foot and mouth disease is introduced again.

1447. And you believe that it would be impossible to do away with foot and mouth disease by any regulations that the people would put up with?—If we succeeded in stamping it out we should have it again the next year by the pig trade from Poland.

1448. I suppose that you would admit that the foot and mouth disease is very infectious?—It is very infectious. I am of opinion that the contagious virus is more to be feared in foot and mouth disease than in cattle plague; it is more contagious than cattle plague.

1449. Yet notwithstanding that, you do not believe that you could attempt to stamp it out in the country?—No, I do not believe that we could do it.

1450. On the ground that the measures that would be required to stamp it out would be found to be so restrictive that they would not be tolerated?—No, they would not be tolerated, because I believe that the measure would entail a greater loss than the disease itself. With regard to foot and mouth disease, the last time it broke out, in the year 1876, we had it only, in round numbers, in 300 premises, and the loss in Prussia during the time from October to the end of the year was seven head of cattle.

1451. Does glanders prevail in Germany?—We had many glandered horses in Germany after the war. The army horses introduced the glanders from France.

1452. Do you slaughter in the case of glanders?—The animals are killed by order of the authority, and they are paid for, the compensation being half the value.

1453. Does that compensation fall, as in the case of cattle plague, upon the Imperial Treasury?—No; as in the case of pleuro-pneumonia, it falls upon the local authority by a tax, which is levied upon every horse-owner. Each horse pays a penny a year or a halfpenny a year, and by those pence a fund is raised out of which the compensation is paid.

1454. Is there any other point that you would like to put in in evidence?—I would only hand in a Table showing how much glanders has been lessened in horses by the measures which we have adopted. I would beg permission to say a few words about the evidence of Professor Brown. There are some points which I have noted down from the proof sheets which Professor Brown was kind enough to give me. Concerning Question 13, I would only say that the cattle plague was introduced into England in 1872, not by German cattle, but by Russian cattle. In answer to Question 94, Professor Brown says that the introduction of dead meat has been prohibited in England because you feared that, after the outbreak in Germany, they would kill the diseased or suspected cattle, and bring infected meat here. That is not to be feared, because nobody would kill cattle and bring meat of the killed cattle to England and lose money by it, when he can get from the Imperial Treasury the whole value of the animals.

1455. What you mean is that our protection in that case is that your Government pays the full value?—The full value. What Professor Brown suggests is never to be feared. I cannot accept the statement of Professor Brown in this matter.

Professor *Müller.*

4 June 1877.

Chairman—continued.

1456. In your opinion, in consequence of the fact that it would be a loss to the exporter, the infected meat would not come in?—No; it is against the interest of the owners to do as Professor Brown suggested. Then I would draw your attention to the answer to Question 276. That is a mistake. The five sheep in Emden were not killed because they had cattle plague; they were killed because they had been in contact with infected cattle.

1457. Those 100 sheep mentioned there were only a flock of sheep that happened to be in contact with the diseased animals?—There was during the last outbreak only one case, and also a doubtful case, in Emden. In the beginning of March a sheep had been killed because the veterinary officer was of opinion that it might have cattle plague; but those five sheep of which Professor Brown spoke had been killed only because they had been in contact with infected cattle. Then, in the answer to Question 286, the remarks about clergymen are an error. It is never the case in Germany that a peasant goes to a clergyman to ask him to act as a veterinary surgeon in a village. Then I must make a remark also about Question 640. The smuggler in Upper Silesia was not shot, but he is in prison and under trial.

1458 Was no one shot upon that occasion?—Yes; I believe three or four were shot by the soldiers.

1459. But not the particular criminal?—No; he is in prison and under trial.

1460. He is in prison at this moment, is he not?—At this moment. I do not know if the judgment is already out, but I know he is under trial, and he will have two or three years' imprisonment.

1461. With regard to the men who were shot, which is, perhaps, a worse case, why were they shot?—Because they were breaking through the cordon; they were shot because they did not obey. The sentry has orders to let no man pass, and that if he challenges a man three times and he does not stand, he is to shoot at him.

1462. Did those people refuse to answer the challenge of the sentry?—Yes.

1463. Were they deaf?—In one unfortunate case, near Breslan, it was a deaf boy.

1464. Are there any special restrictions as between Germany proper and that part of Germany known as Schleswig-Holstein?—No; that is against our laws; we cannot have restrictions and guarantees in our own country.

1465. In fact our protection in the case of Schleswig-Holstein cattle is identical and the same with the protection which we get in the case of German cattle?—It is, your protection lying only in the circumstances that Schleswig-Holstein introduces no cattle or very few cattle from Germany.

Mr. *W. E. Forster.*

1466. This last outbreak of cattle plague was the worst that you have had for some time, was it not?—Yes; since 1870 and 1871, during the war.

1467. Will you state how many outbreaks you have had during the last six years?—We had the great outbreak during the war in 1870 and 1871; that was the greatest outbreak that we have had in this century; after that we had only few outbreaks, some of them where the diagnosis was very dubious in the vicinity of our frontier.

Mr. *W. E. Forster*—continued.

1468. In what year was that?—In 1872 we had the case in Hamburg; in 1874 we had cases only in Beuthen, in Upper Silesia; and in 1875 we had a case in East Prussia, as to which I have grave doubts whether it was cattle plague; and also in Saxony, as to which I am convinced that it was not cattle plague.

1469. We got cattle plague by the "Castor's" cargo; from what part of Germany do you think the cattle came which gave the infection in Hamburg?—I know this matter very well, because I have been commissary of the Empire in the last outbreak in Hamburg and Breslau, &c. The cattle on board the "Castor" were from three stables in Altona, and all the cattle that were infected and were diseased in Altona, were out of the same herd that also were in the "Castor." They were cattle from Silesia.

1470. How long had the cattle plague been discovered to exist on German territory before that cargo was shipped from Hamburg?—The first case of cattle plague in Germany was detected in Upper Silesia, on the 5th of January.

1471. You will observe that this case tends to show that we are in danger of cattle plague almost as soon as it breaks out in your country?—Yes, I cannot deny it.

1472. I suppose that it is rather the interest of the owners of cattle which are supposed to be at all infected, to send them as quickly as possible to a large market like Hamburg?—It is the interest of the cattle traders, not of the cattle owners; I mean of the farmers.

1473. Do you remember the outbreak of cattle plague in 1872?—I do.

1474. At that time we discovered the cattle plague in a given cargo before you were aware of its existence in Hamburg?—That is the case.

1475. How do you account for that?—I must tell you it as I remember it. The cattle were brought from Cronstadt to Lubeck, and from there to Hamburg; and on the pasture, near Hamburg, the cattle were taken and put together with Hamburg cattle, and were then brought in a ship to England. There was no case of disease in the pastures, but during the transport to the ship the disease was propagated; it was only after ten days that we had the first case on the Hamburg pasture. That was the second propagation of the disease in Germany, and you saw the first propagation on the ship.

1476. Then the fact was that, in 1872, we had the disease before you had it in Hamburg?—Yes; because you had the first propagation, and we had the second propagation.

1477. With regard to the prohibition of import into Germany from Russia, was it not the case that for some time after that law was passed it was still possible to put cattle on to a railway, and to take them through Germany to be exported here?—No transit is ever dealt with as import.

1478. Was it not so for a time?—It might be so before 1871, but never since.

1479. Where do you think cattle plague is at present?—In Poland, I believe; and I have seen in English newspapers a telegram that it has spread in Poland now more than it did the last time.

1480. You

Mr. *W. E. Forster*—continued.

1480. You mean Russian Poland?—Russian Poland.

1481. It is in Galicia?—According to the Austrian news it is not, but I believe it is.

1482. Do you think it is in Roumania?—I have no information as to that; but I am certain it is, because it follows the Russian army.

1483. Is it in Transylvania and Bulrowina?—That is the land of the Hungarian Crown, and all the lands of the Hungarian Crown are, according to the reports, free from cattle plague; but in reality, I believe, they are not.

1484. That being the case, and there being this great danger of cattle plague in the Hungarian territories, why do your Government, with their great anxiety to keep safe, make a distinction between the grey breed and the other Austrian or Hungarian cattle?—Because on the lands of the Hungarian Crown only cattle of the grey colour is bred; they have only those grey cattle in Hungary.

1485. Then, in fact, your prohibition of the grey cattle prohibits, generally speaking, the Hungarian cattle:—Yes, and the Galician cattle and cattle of Bukowina.

1486. Have you any large distilleries in Silesia?—Not many in Upper Silesia.

1487. Have you large distilleries like the Moravian distilleries?—We have not, but we have great sugar fabrics.

1488. What happened in Moravia where there is a large trade in cattle which are brought from the East and fed up in the distilleries, does not apply to your country?—No, the cattle which are fattened in the Moravian distilleries being chiefly of the grey race, go chiefly to the Vienna market.

1489. What districts in Germany are those which export most to England?—Schleswig-Holstein, Oldenburg, and the vicinity of Madgeburg in Saxony.

1490. Do many cattle come from Pomerania?—No, not many. The cattle in Pomerania are a small breed, and they go to the Berlin market.

1491. I suppose the Berlin market has got to be a very much larger market than it was?—It is not only a market for Berlin itself, but it is also a great export market for the great manufacturing towns in the Rhenish provinces, which receive many head of cattle from the Berlin markets.

1492. Returning to your regulations in regard to cattle plague, do you order the slaughter of any animals except those that either have the disease or have been in contact with those that have the disease?—We order the slaughter of all diseased cattle, and of all those cattle that have been in contact with them; but we go sometimes further. If th ecattle plague is on several premises in the same village, we have the power to order also the slaughter of cattle in premises that are not infested. I say, "Here is a great peril; I will not let the disease go further;" and, as Commissioner of the Empire, I have the power to say, "Here are infected premises, and here are four premises around them with healthy cattle; and now to save the village I can order that all the cattle around an infected place may be killed."

1493. Will you be kind enough to look at a suggestion, which was made by the Committee of the House of Commons in 1873, which seem to me to be similar to that which you carry out, and tell me whether I am correct in that?—That is what I would say.

Mr. *W. E. Forster*—continued.

Professor *Müller*.

4 June 1877.

1494. You find that it is necessary, in order to stamp out the disease, that you should have the power of ordering the slaughter of cattle in a limited area around the animals that are actually infected or are in contact with those which are infected?—I believe it is necessary, and I must here draw your attention to our first experience. I say that although the stamping out of cattle plague, and of every other contagious animal disease, seems to be in the first instance exceedingly expensive, it is the cheapest in the long run.

1495. Then I suppose you have no hope of curing the disease of cattle plague; you think that no measure answers excepting stamping out?—No; and in Germany every experiment in giving physic or in treating the malady is prohibited under a heavy penalty.

1496. I imagine, from what you have stated, that the loss and the alarm of this last outbreak have made your Government more determined than ever to guard against the disease for the future?—Yes, and to take the most energetic means for dealing with it. It is my private opinion that we shall have cattle plague accidentally in one or other border village, and that is of no great question; but our greatest care now is not to let it go beyond the border, and therefore we must take the most stringent means to protect our own country. We have gained experience in the last outbreak that cattle plague goes from the border districts to the great cattle markets, and that the great cattle markets are the most perilous in spreading the disease. Therefore I see that the greatest protection now is in this regulation, that all cattle markets must be closed on the same day when the first case is found out in a border village. Let me exemplify that; in the last outbreak, if we had closed the cattle market in Breslau, the cattle market in Berlin, the cattle market in Dresden, and the cattle market in Hamburg, on the 5th of January 1872, when the first case of cattle plague was found out in a Silesian village, I do not believe that the cattle plague could have gone to England.

1497. With regard to the closing of markets, what was done when you closed the market at Berlin, for instance?—We let all cattle come to the market, but we do not allow any cattle to go living from the market.

1498. So that you do not prevent the slaughter for the food of Berlin?—We let them come in, but we do not allow any cattle to go out alive from the market.

1499. With regard to pleuro-pneumonia and foot-and-mouth disease, if you will take Professor Brown's Report in your hands, you will observe that at page 51, he says that "Only one outbreak of pleuro-pneumonia was reported from Germany during the past year, which occurred in the month of February in the province of Pomerania. Since then, however, the disease was detected in German cattle by the inspectors at the ports in this country, in the months of April, June, and August." By that paragraph, it would appear that the reports to us did not at all correspond with the extent of the disease?—Certainly not.

1500. Could you explain why that is the case?—I do not believe that there is any international

Professor *Müller*.

4 June 1877.

Mr. *W. E. Forster*—continued

arrangement to report about pleuro-pneumonia. I do not know who it was that reported that it was in Pomerania; but perhaps the consul.

1501. The fact is, that you have had pleuro-pneumonia in a good many places in Germany?—In very many places, but I believe not in so many as you have it England.

1502. And the same remark would apply to foot-and-mouth disease?—The same remark applies to foot-and-mouth disease.

1503. You are not surprised at our regulation for ordering the slaughter of German animals at Deptford?—No, I believe that it is necessary, under the present circumstances, to slaughter German cattle at Deptford, only without Schleswig; for Schleswig there may be an exception.

1504. With regard to Schleswig, it is impossible for you to have a law separating Schleswig from the rest of Germany, is it not?—That is not possible, as in England it would not be possible to have a law for a single province.

1505. Have you read the regulations which we put in force to give us some security with regard to Schleswig?—Yes.

1506. Is it your impression that they are really sufficient to guard us?—Completely so, because you are importing through Schleswig-Holstein only Danish cattle, and cattle bred in Schleswig; the greatest part of the cattle imported by way of Schleswig-Holstein is Danish cattle.

1507. But against that we have the fact that we had cattle plague in 1872 and in 1877 at Hamburg, and in fact it has spread into the border of the Schleswig-Holstein district?—Into the Holstein district, but not into the Schleswig district. It was in villages which may be called suburbs of Hamburg, if you except Ellerbeck, which is seven or eight English miles from Hamburg. All the others are in the immediate vicinity of Hamburg and Altona. There was a cow that was sold from Hamburg to a peasant in Ellerbeck, and in Ellerbeck there was only one premise infected.

1508. I suppose the cattle trade being the most important trade to Schleswig-Holstein they are excessively strict in drawing a cordon?—They are strictest in Germany.

1509. In 1871 you stopped the import from Russia into Germany, did you not?—Yes, but not by sea.

1510. When did you stop the sea import?—After the misfortune in Hamburg.

Mr. *Assheton*.

1511. I understood you to tell us that the compensation for animals killed for cattle plague was paid out of Imperial sources?—Yes, from the Imperial Treasury.

1512. And that the compensation paid for cattle killed for pleuro-pneumonia was paid out of local rates?—Yes, if you translate it in such a manner. We call it provincial funds. A province with us is a greater territory than your local provinces. We have only ten provinces in Prussia.

1513. I am aware of that, but why is the compensation for pleuro-pneumonia less than the compensation for cattle plague?—Because the value of the diseased cow is lessened so much by the disease; and you must remember, also, that of the cattle killed to stamp out pleuro-pneumonia everything can be used. To give an example, here

Mr. *Assheton*—continued.

is an ox suffering from pleuro-pneumonia; the public authority says, "This ox must be killed;" then he is slaughtered, and the hide and the meat and all is sold, except the lungs, which must be destroyed; and to what the proprietor receives by selling the hide and meat, &c., so much is added as represents four-fifths of the actual value. It is not of so great avail to stamp out pleuro-pneumonia as it is to stamp out cattle plague, and we should not pay the whole value in cases of cattle plague if we were not of opinion that by paying the whole value as compensation we should induce the proprietor to give notice of the first case. We put the proprietor in a situation that he is glad to give notice at the first moment; therefore we pay also for the animals that have died by the disease.

1514. I will put it in another way if you will allow me. If you kill a cow suffering from cattle plague that is worth 15 *l.*, you pay the man 15 *l.*; if you kill a cow that is suffering from pleuro-pneumonia, how much would you pay?—£. 12.

1515. Why, in your opinion, is a man to get 15 *l.* for his cow if it is killed for one reason and only 12 *l.* if it is killed for another?—In the case of cattle plague we kill cattle which have been in contact with diseased cattle. In pleuro-pneumonia we kill only diseased cattle, and not healthy cattle, and diseased cattle is of smaller value than healthy cattle; therefore, when we pay four-fifths of the value it is more than the real value of the diseased cattle. When we pay compensation in cases of cattle plague on this principle of paying the whole value, we do it only to induce the proprietors to give notice at the first moment.

Chairman.

1516. It is simply as a bribe, in fact?—It is a prize given for giving notice.

Mr. *Assheton*.

1517. Do I understand you rightly, that you have no regulations at all about foot-and-mouth disease?—We have regulations, but the regulations are only as follows: we have notice that the foot-and-mouth disease has broken out on premises; we order the proprietor not to leave his premises with his cattle, or with his pigs, or in other words, we shut the diseased beasts in the premises; that is the only measure. To give you an example, we will suppose that a herd of cattle or pigs is going to market; if the veterinary inspector or police officer sees that those cattle or pigs have foot-and-mouth disease, he has the right to lay his hands on them and say, "You go no further; here I shut you up in such and such premises."

1518. Is an owner of cattle suffering from foot-and-mouth disease obliged to give notice of it?—He is; it is the same in all cases of contagious disease. Not only is the owner bound to give notice, but also the veterinary surgeon who is treating the diseased animals; the veterinary surgeon will be punished, and the owner also, if he does not give notice.

1519. I see in this morning's paper there is this paragraph: "A correspondent writes to us under date, Hamburg, May 31st, that foot-and-mouth disease in a virulent form has broken out near here amongst some grazing stock"; have you

Mr. *Assheton*—continued.

you heard of that?—No I have not. We have foot-and-mouth disease every year, and we cannot avoid it, because we have it time after time by the trade in pigs from Poland, and you can follow in Prussia the round of foot-and-mouth disease by following the pig trade.

Sir *Rainald Knightley.*

1520. Did I rightly understand you to say that cattle plague in sheep was very uncommon in Germany?—Very uncommon.

1521. I think you said that in the whole of your experience, you only knew one case of cattle plague in sheep?—Only one case in Emden, during the last outbreak, and that case was doubtful.

1522. Therefore, if the importation of German cattle into England were prohibited, sheep might be imported with no danger at all?—I see no danger. Now from Russia, sheep may be sent to the border districts, but under certain restrictions. The number of sheep that are introduced from Russia are very small, but when we shut our borders against Russia, if we allow sheep to come over our border districts, we prove by it that we have no great fear about the sheep.

1523. And you think that the sheep might be imported into England without any danger at all?—Yes.

Mr. *Elliot.*

1524. Has rinderpest ever been known to break out in Prussia without the introduction of foreign cattle?—Never.

1525. Have you seen any report that has been made to the Veterinary Department at Berlin, on the "Castor" case?—No.

1526. Do you know anything of that report (*handing a Paper to the Witness*)?—I do not know this report; I see it now for the first time, and I do not know who is the reporter.

1527. Has there been any report made from Hamburg to head quarters, in Berlin, in this case?—I do not know; I have not seen it at Berlin.

1528. In cases where there is an outbreak do not the authorities always have a report made as to the causes of the disease?—Yes, but I do not see every report that is made.

1529. It does not come before the Veterinary Department?—It does not come in every case before the Veterinary Department, because all the cases of cattle plague are not in the Prussian Veterinary Department, but are treated at the office of the Chancellor. It is quite a matter of the Chancellor's.

1530. Do you agree with the substance of this report?—No, I do not agree with it; it seems to be the excuse of the veterinary inspector.

1531. Do you not think that it is a very lame excuse?—It seems to be a very lame excuse.

Chairman.

1532. I understood you to say that the veterinary inspector had been already suspended?—He is suspended, and he is a ruined man for life, and I do pity him, poor man; he had a very good place; the other inspector, in Hamburg, is under trial; we call it a disciplinary trial.

1533. Is it a departmental trial by the minister?—It is; it is not punishment by a court of law.

1534. It is not a judicial trial, but a trial by his master?—By his master; by the minister.

Mr. *Elliot.*

1535. Do you allow manure or hides, or anything else likely to cause infection, to come across the frontier without inspection?—It is very seldom that cattle plague is carried by hay or straw, but manure is another thing. We allow hides to come if they are dried or salted; the drying is the best disinfection that you can have.

1536. I think I understood you to say that you would reduce the restrictions if there were no signs of disease on the frontier for some time, or if the Russian army was likely to be demobilised?—We should wait a long time before we should reduce our restrictions, because it is not to be trusted.

1537. Do you mean the restrictions now in force, or the former ones?—The general restrictions will be continued, and the more stringent restrictions will be kept up as long as it is possible, until we are convinced that there is no danger.

1538. Can you ever be convinced that there is no peril on the frontier of Russia?—We can now, because we have veterinary inspectors on our frontiers towards Russia and Poland, and we can better discover cattle plague there.

Mr. *Jacob Bright.*

1539. Germany is now a prohibited country so far as we are concerned, is it not?—It is.

1540. And we used to get large supplies of food from Germany?—Chiefly from Schleswig and Holstein.

1541. What becomes of those supplies now?—They are going to the great towns in Germany. You must not forget that your greatest supply is the supply from Schleswig-Holstein. The Schleswig-Holstein supply comes to England only in the times when the fattening on the great pastures goes on in the months of July, August, September, October, and until the beginning of November; and, therefore, Germany is not now suffering much from the prohibition, because of what you receive from Germany almost five-sixths is from Holstein.

1542. I suppose that much of the cattle that we should have got from Germany is now going to Paris, is it not?—I do not think it is. I believe that the French receive from Germany more sheep than cattle; the export of sheep to France is a very great one.

1543. I understand you to say that you have been very much strengthening the safeguards against disease in Germany?—We have tried to do so.

1544. And therefore you think that presently we ought to readmit your cattle and sheep?—I believe that you can admit them now without fear. If you ask me, I should say admit them, but order the German cattle, except the Schleswig cattle, to be slaughtered at Deptford. If I were in your place I would not give orders to let them go over the country; I would advise that all the cattle should be slaughtered in Deptford market, except the Schleswig-Holstein cattle.

1545. You think, in fact, that Germany ought to be a scheduled country, but not a prohibited country?—I think it ought to be a scheduled country, yet with the exception of Schleswig-Holstein, and not a prohibited country.

1546. Would you say that with regard to German sheep as well as German cattle?—No. I believe you might let the sheep go as from an unscheduled country. If you asked my advice upon

Professor *Müller.*

4 June 1877.

Professor *Müller*.

4 June 1877.

Mr. *Jacob Bright*—continued.

upon that, I would say that you can now put Germany in the same state as before the outbreak of cattle plague.

1547. With regard to sheep?—With regard to sheep, and also with regard to cattle.

1548. You say you would put it in the same state as it was in before the cattle plague. What was the state then; was Germany free or scheduled?—It was scheduled; I would not ask that Germany should be free as Spain and Portugal are; I would myself give the advice that the German cattle should be slaughtered in England always, with the exception of the Schleswig-Holstein cattle.

1549. You have stated, I think, that you have never known but one case of sheep having the cattle plague?—I have seen it in France several times, but not in Germany. In France I saw it in 1871 very often. It is very difficult to recognise cattle plague in sheep, and I have never seen in Germany one case in which cattle plague was spread by sheep.

1550. You do believe that cattle plague can be communicated by sheep?—I do believe it; but I have never seen it in Germany.

Mr. *Ritchie*.

1551. I think you said that you thought that we should adopt a wise course if we slaughtered the cattle at Deptford?—I did.

1552. Do you think that it would add greatly to the risk of carrying infection throughout the country to bring cattle up to the London market to slaughter?—I believe that you have no power to hinder cattle going from the London market into the country.

1553. But supposing that we had that power, do you not think that the transport from Deptford to London would increase the risk of carrying contagion?—If you disinfected the railway trucks at once after it, you might carry them.

1554. Does not everyone who comes in contact with cattle having the cattle plague, more or less, carry contagion wherever he goes?—Yes, but that is a very exceptional case; you have asked me if I would advise that cattle should be slaughtered at Deptford, and then you asked if we would do as you do in cases of cattle plague, that is to say, not allow living cattle to go from the market. Under those circumstances I see no great difference between the Islington market and Deptford; the only difference is the transport from the Islington market to Deptford. It is said that cattle plague might be spread by a man who is on the place; it is much talked about, but it is very seldom done; it is only conjectural.

1555. If the cattle were of more value alive in the London market than they could be at Deptford market, you would say let them go to London?—I would say let them go to London, under the presumption that the London market is closed against export.

1556. Was there any inspection of those cattle at Hamburg before they were shipped in the "Castor"?—There was; they were inspected twice in a day. The "Castor" left Hamburg on Friday the 12th of January, and they were inspected in the morning by the veterinary inspectors and also in the afternoon; in the morning, in the premises of the cattle traders, and in the evening, in the haven before loading in the ship, and the inspectors found nothing. In common

Mr. *Ritchie*—continued.

times I would have excused the veterinary inspectors if they had seen nothing by their examination. A veterinary inspector sees hundreds of cattle, one after another, and he will sometimes be a little superficial. That is only human. But I believe that the inspectors in Hamburg deserve punishment because they must have known that cattle plague was in Silesia; and under those circumstances, knowing that cattle plague was in Silesia, they ought to have been severer in their examinations.

1557. In point of fact, you do not think that the examination which now takes place is any safeguard at all?—I believe that only when the examination is made in such a superficial way as it was in the case of the "Castor."

1558. Your opinion is that the examination which does take place, and which has taken place, is so superficial as to be valueless?—I have not said that; you have not understood it rightly. I say that under the circumstances I would excuse it if in one case it is done a little superficially, because I think that is only human; but if a veterinary inspector knows that cattle plague is on the border, it is his duty to do the work in a very stringent manner.

1559. But this veterinary inspector, knowing that the cattle plague existed, even then made only a superficial examination?—Yes, and therefore he is removed from his office.

1560. There were two inspectors, were there not?—One is the Prussian inspector, and the other is the Hamburg inspector, and we can only judge about the Prussian inspector. In the case of the Prussian inspector the trial is finished; but the Hamburg inspector is yet under trial, and the judgment is not yet given.

1561. Do you know whether there is any intention of making regulations by which this examination would be made more effectual?—I believe that if it is wished that special regulations and distinct instructions should be given to those inspectors as to how the examination should be made, such instructions would be given.

1562. But you do not know whether anything is in contemplation?—I do not know because I have not asked, but if you like I will ask it. I understand your question to be whether it is not the intention of the highest Prussian authorities to give an instruction and strict regulation how examinations in the ports should be made, and I will inquire as to that.

Mr. *Pease*.

1563. Supposing Germany was not scheduled, would the quantity of cattle coming from Germany be very much increased?—I do not believe that the quantity of cattle would be very much increased; but I believe that the import of sheep would be very much increased. I have no great experience of these questions which are questions of trade, but you receive from Germany, I believe, on an average, about 70,000 head of cattle in the year; and of this average number, four-fifths or five-sixths are Schleswig cattle.

1564. You described, I think, to the Right honourable Member the closing of the cattle market, and you said that the fat cattle coming in to Berlin were all slaughtered, and nothing went back again into the country; but when a market is closed is there a movement allowed in the country of lean cattle from farm to farm?—

It

Mr. *Pease*—continued.

It is allowed in districts which are free from cattle plague.

1565. Without any restriction? — Without any restriction. The great markets for slaughtering purposes are our peril. The peril is that in a great centre are assembled cattle from all parts of the kingdom, and therefore we must shut those markets on the first case of cattle plague being found out, in Silesia, or in another rural district, I believe, that by this measure to shut every cattle market in the great towns on the same day when the first case of cattle plague is detected in any village in the country we have the best means of protecting our own land, and also the neighbouring countries.

Mr. *M'Lagan.*

1566. I think that you stated that you did not think that there was much risk in an individual carrying cattle plague from one place to another? —No, from my experience the possibility cannot be denied, but I think it is not so often the case as it is said to be; for I must draw your attention to the fact that going through the air a certain distance is the best disinfection you can find. The peril is that an individual may carry manure on his shoes, and by means of this manure he can, I believe, take the cattle plague over a great distance; but in his clothes, I believe, it is not to be done.

1567. Do you make the same remark as regards dogs; do you think that dogs cannot carry the infection?—I believe that they can, because they may carry manure on their feet; and the hair also is very hygroscopic, and it can retain the infecting matter. Therefore we have it laid down in our laws and regulations that in all places infected by cattle plague, dogs must be bound in their lair by a chain; and if a dog is seen running freely in the place where cattle plague exists he is shot.

1568. Then if a dog will carry infection in its hair, live cattle coming from an infected country will also carry the infection in their hair, will they not, though they are not infected themselves at the time?—No doubt, and that is the great peril by sheep, for sheep can have it in their wool.

1569. You have seen sheep affected, I suppose, by cattle plague? — I have seen it in France.

1570. Then do you think that there is no risk in bringing live cattle to this country and having them slaughtered at Deptford?—I see no peril whatever in that, if only your regulations at Deptford are in good order. It is clearly proved that you have had cattle plague by bringing diseased animals to Deptford, but it is your fault that you have let the disease go out from Deptford.

1571. But supposing that there was a vessel in which diseased cattle had been carried on a previous voyage, and that that vessel had not been properly disinfected, and that it went to a clean port, and sound cattle were put on board that vessel and brought over to Deptford, is there not a risk of her bringing the disease to this country then?—The boat must be disinfected in a sufficient manner.

1572. What regulation would you suggest for disinfecting that boat?—I would destroy as much as possible all the wood that had been in contact with cattle and with cattle manure.

Mr. *M'Lagan*—continued.

1573. Then you would say that there is a risk, even in bringing over sound cattle, that the disease may be brought over to this country if the infection was in the boat?—If the infection was in the boat; but we have a law in Germany that every ship and every railway truck that has been used for cattle must be disinfected in a strict manner.

1574. Whether they carry diseased or sound cattle?—In all times. That is also a law of the empire and not only for Prussia.

1575. That will meet the case, you think?—That will meet the case.

1576. How soon can you discover the disease upon an animal after it has been infected?—On the fifth or sixth day as a rule, but it may go to the ninth day.

1577. Then there is the risk that, although examined and passed at Hamburg and found to be perfectly sound, the animals may show symptoms of disease before they come to Deptford?—Yes, it is possible, but it has not occurred. It is possible that the inspectors may have seen nothing at all, because the disease was what we call in the stage of incubation between the infection and the outbreak of the disease, and in such a case no inspector in the world can see any disease. But the "Castor" was on its way from Hamburg to Deptford from Friday evening to Monday morning, and in that time the cattle plague could not get so far as that one of the cattle was dying on the sea, and one was dying on arriving here in London. The incubation of cattle plague lasts five or six days at least; and when one of the cattle is dying by cattle plague in the same day or the day after, then the symptoms must have been of such an area that a good examination would have found out that the cattle were not healthy. They are saying as their excuse, that they saw that one or two of the cattle were ill with the foot and mouth disease, and that they had retained those cattle that were so ill.

1578. You say that there is some risk in bringing over live cattle to Deptford of their bringing the disease here; are you still of opinion that the best plan would be to bring them over and slaughter them at that port?—I would consider that to be the best plan.

1579. Have you ever considered what would be the loss to Germany if the cattle were slaughtered in Germany instead of being brought over alive and slaughtered at Deptford?—We have as yet no experience about it; I can only form a judgment after the various experiments that are made on the Austro-Russian border, and also on our Russian border, to slaughter the cattle and to bring the dead meat to our great towns; that is quite similar to your case, and we have seen that all those experiments have failed.

1580. Could you give the Committee any idea as to the loss per head of slaughtering cattle before importation as compared with slaughtering them after they have been brought over here?—No; but I can only state that in Austria there is a law about slaughter-houses on the border, and all those slaughtering houses that were destined to bring dead meat from the Russo-Galician frontier to Vienna have failed without an exception; and we are of opinion that all those ar-

Professor *Müller*.

4 June 1877.

Mr. *L'Logan*—continued.

rangements to bring over dead meat from a great distance are likely to fail; it is very difficult to sell the offal with advantage; if you have great slaughtering-houses you must have industries for the hides and also tanneries; you must have industries to dispose of the manure, of the tripes, of the feet, of the horns, and of the lesser portions of the cattle. Those are not made in one year, and I believe that it will be a long time before all those industries can be put in operation; then also I fear that meat is too dear in Germany for there to be a trade in that meat; meat in Germany is not much cheaper than it is here in London; I believe in Berlin, meat is dearer than it is in London, and therefore it is not possible to arrange for such a trade; you receive our best cattle from Schleswig, and I believe that it would make a very great difference if Schleswig sold the cattle in another place.

Mr. *Chamberlain*.

1581. I think you told the Committee that you had a census taken of all the live cattle?—Yes, in the prescribed zone; and the landowner would be punished if he gave false notices.

1582. Does that exist only in districts in which the disease has occurred?—It exists in all diseased districts; in the last outbreak it existed in the whole country, but now it exists only in the border provinces.

1583. Then the moment the disease breaks out you ask for this return?—Yes, in all the provinces where the cattle plague breaks out.

1584. Does that apply only where there is cattle plague, or does it apply where there is pleuro-pneumonia?—Only in cases of cattle plague.

1585. Under such circumstances the animals are not allowed to be bought or sold without an order?—Not without an order, and without making a note of it in the return, or census as you call it; I call it the cataster.

1586. Is there any similar restriction in parts of the country which are not infected?—No.

1587. The trade is perfectly free?—The trade is perfectly free; it is only a measure of restriction in infected districts, or in such districts which we fear may be infected. I believe it is so put down more clearly.

Colonel *Kingscote*.

1588. Is the Veterinary Department at Hamburg under the control of the Veterinary Department at Berlin?—It is not; Hamburg is a free State.

1589. As Hamburg is not included in your regulations, can you tell the Committee what regulations are in force there in the case of cattle plague?—Quite the same as in Prussia; for the law against cattle plague is not a Prussian law, but it is a law of the Empire, and the law against cattle plague has quite the same meaning in all Germany.

1590. But supposing that there is no cattle plague, what then?—Then the Hamburg State has its own laws. It is a free State, and I can only say that the Hamburg laws concerning pleuro-pneumonia are yet more stringent than the Prussian laws. They are killing more in cases of pleuro-pneumonia than we are killing. We are killing only the diseased animals; but under the Hamburg laws the cattle in contact

Colonel *Kingscote*—continued.

with diseased animals are killed in cases of pleuro-pneumonia.

1591. Do you consider that rinderpest, cattle plague, pleuro-pneumonia, foot-and-mouth disease, sheep pox, or sheep scab, ever originated spontaneously in Western Europe?—No, never. We are of opinion that all contagious diseases of cattle are only spread by contagion, and that they do not make their appearance by spontaneous generation.

1592. Do you think it would be possible under proper regulations to exterminate these diseases from an island like Great Britain?—That is a question which is very difficult to answer.

Chairman.

1593. I have understood you already to say that you believe the regulations which you adopt will stamp out pleuro-pneumonia?—I believe so; but I am now asked, as I understand, whether I consider it possible that these contagious diseases not originating spontaneously may be stamped out in England, which is an island. I do not know the English circumstances sufficiently to answer the question; but if I should give an answer only scientifically or theoretically, I should say that I cannot deny the possibility of stamping out every contagious disease by proper regulations. But I do not believe, according to my knowledge of the English circumstances, that it will be possible in England. For stamping out these contagious diseases in animals would necessitate changes in all your administration. Stamping out diseases among animals needs a despotic power.

Colonel *Kingscote*.

1594. You have said that it could not be done in your country, and you think that it would be still more difficult to do it here?—We have our difficulties, and I believe you will have more difficulties than we have. I believe that no Englishman would tolerate such measures as we take to stamp out pleuro-pneumonia and glanders.

1595. And yet you do not succeed?—We did not succeed till now, and we are ever combating against it. Then, I would remark, that it is our great misfortune that we have not enough good veterinary surgeons who can be trusted with all these matters, and we must lay great powers in the hands of such men. Where would you find the veterinary staff necessary to stamp out all these diseases; and the veterinary officers to whom you could give such enormous powers? I do not believe that you will find them in England.

1596. What is your opinion of our measures of the veterinary police as compared with yours; do you think ours are as efficient as yours?—No. Here I must speak as a German. I cannot find a word for your measures. You have no measures at all, in my opinion.

1597. It is what we should call higgledy-piggledy?—I do not know what you are saying; but if I tell you the truth, I should wonder that you have succeeded at all with your measures.

1598. Can you tell us what are the expenses of your Veterinary Department in Germany as compared with ours?—I cannot tell you very rightly as compared with yours; I do not know how much you pay.

1599. How are your towns supplied with milk in

Colonel *Kingscote*—continued.

in Germany; have you dairies in the towns or in the country?—There is quite a difference in different towns. To give you an example; in Vienna it is similar to London; in Vienna you have in the town a great number, many hundreds of dairies. In Berlin you have very few dairies; we do not like the dairies in the towns.

1600. Do you find that pleuro-pneumonia and other diseases emanate very much from the dairies?—The dairies near the great towns are the hotbeds of pleuro-pneumonia, because in Germany it is quite a custom in all such dairies that they are for ever buying and selling cows; they buy cows fresh milking, and then they milk them to a certain point, and then they sell the cows to the butchers.

1601. Have you any special regulations with respect to the management of the dairies?—No; we have no express regulation, but we receive almost all our milk in Berlin from great distances by railway. We have very few dairies in the town.

Mr. *Arthur Peel*.

1602. Are all the inspectors in Germany now Imperial inspectors?—The whole are Prussians, Bavarians, and Saxons, &c.; but we have inspectors in all German States, with the exception of only two, Mecklenburg and Brunswick.

1603. Do those inspectors act under any regulations from any central department?—They act under the regulations of the laws of the Empire, or under the laws of their own States; thus, the Bavarian inspector is acting under Bavarian laws, but in cases of rinderpest he is acting under the laws of the Empire.

1604. In cases of rinderpest the laws under which all the inspectors act are the same?—Yes, but not in the case of pleuro-pneumonia; then they are acting under the laws of their own State. There are only two little States where they have no veterinary officer. Mecklenburg and Brunswick have no veterinary organisation.

1605. Can you tell the Committee the date of the smuggling of the diseased animals over the frontier to Breslau?—I do not know the date exactly.

1606. Have there been any regulations since that?—No; since that there was a military cordon on the frontier, but it is now retired; it was retired, I believe, in the second half of the month of April.

1607. Then what security has Germany that smuggled cattle cannot now be introduced over the frontier?—Because it is our intention to prevent the smuggling of cattle to avoid rinderpest, by the most stringent measures I have mentioned.

1608. Cannot they now be smuggled over in the same way as before?—No, they cannot, because the number of policemen and of custom-house officers has been much increased.

1609. I suppose you regard your regulations against the introduction of cattle from Russia as permanent laws?—They have lasted now for six years, and I believe they will be perpetual.

1610. They will never be taken off?—No, never.

1611. Does Russia take any precautions against the disease?—No; there are very good laws, but they are laws on paper, and almost nothing is done in Russia.

Mr. *Arthur Peel*—continued.

1612. You said that it was more easy to detect the disease in the living than in the dead animals; do you believe that it is possible to detect the disease in the dead carcase in the butcher's shop?—I take it to be impossible to detect it in the meat without seeing the organs.

1613. Do you or do you not agree with Professor Brown who said that disease could be communicated by a dead carcase?—That is very often the case; if you asked me what is the greatest risk of spreading cattle plague, I would say that, in the first place, it is live cattle; in the second place, it is dead meat; and in the third place it is manure. We have seen in Germany very often the spreading of cattle plague by dead meat; the first cases in villages are sometimes not found out, and the peasantry slaughter the first diseased oxen or cows, and then they sell the meat, and we have very often found that the only cause for cattle plague spreading in a village was the selling of the meat of a diseased ox.

1614. Does that meat come into contact with a living animal?—Very often. It is the custom of our peasantry to put the water that has been used in washing meat in the washtub, and the cattle are fed very often in Germany from the washtub, and that is the best means to propagate cattle plague if the meat was that of diseased cattle.

1615. Do you, as a veterinary authority, believe that the dead meat of an animal in which the disease has been incubating, when it is killed is deleterious as human food?—No, there has never been a case known in which the meat of cattle diseased by cattle plague was infectious to human beings.

1616. But it could infect other cattle?—It could infect other cattle, and it could infect also perhaps sheep or other ruminants, for, as I said, dead meat from a railway car infected the animals in the Jardin d'Acclimatization.

1617. You said, did you not, that you considered it necessary to slaughter all German cattle at the port of Deptford?—Except the Schleswig cattle. If you ask my advice as to what you should do with the German cattle, under the present circumstances, I should say slaughter them at Deptford.

1618. Is the danger that you apprehend that the disease may be incubating during the transit?—The transit from Germany to London lasts, I believe, three days, and the cattle must be brought from the eastern provinces to the port of shipping to England, and that will be longer than the period of incubation.

1619. Then, when you said that German cattle must be slaughtered at Deptford, you were thinking mainly of pleuro-pneumonia?—And also of foot-and-mouth disease; and you will have a greater security against those.

1620. In Germany, you take no security, or very little security, agsinst pleuro-pneumonia?—We cannot do it, because of our long land frontier, but we have prohibited the import of cattle from the Netherlands.

1621. But if cattle plague only was in question, you would say that we might admit living German cattle free?—Yes, because when cattle plague is found out in Germany our measures are most stringent.

Professor *Müller*.

4 June 1877.

Mr. *Chaplin*.

1622. I understand that the precautions that you take upon your frontier are permanent, and as strict as possible?—They are.

1623. But in spite of all these precautions you run considerable risk of importing cattle plague into Germany?—By a fraudulent way; by smuggling.

1624. Would anything short of the prohibition of the importation of live cattle into Germany free you altogether from the risk of cattle plague?—We have a prohibition of the importation from Russia of cattle of all races, and from Austria of all cattle of the grey steppe race; and we allow only to be introduced cattle of other races from Austria under certain restrictions I have mentioned.

1625. Do you import dead meat?—We have tried to import dead meat, but I have already stated that all our experiments to organise a trade in dead meat on our eastern frontier have been unsuccessful; and I have stated that in Austria it is quite the same, for Austria is not less anxious than we are to avoid cattle plague from Russia, and therefore Austria has long had a law about slaughtering-houses on the Russian frontier. But all was done without success, and they have now no means of slaughtering cattle on their frontier; it was an experiment that has not succeeded.

Mr. *Chaplin*—continued.

1626. Then you run a certain amount of risk from the cattle being smuggled into the country?—That is our greatest risk.

1627. Is it considerable?—It is very considerable in Upper Silesia, and it is a very well-organised smuggling; but we believe that this peril can be avoided by the measure which I sought to demonstrate on the map with the pins which I stuck in. We have now a district round the Russian frontier, where no cattle can be loaded in railway-cars; or, to say it in other words, we have given up certain of our border districts to protect the other parts of the country.

1628. Then if we in England were to import cattle from Germany, we, I suppose, should undergo a certain proportion of the risk which you yourselves run?—You must rely to a certain extent upon the efficacy of the German measures.

Mr. Thomas Swan, called in; and Examined.

Mr. *Swan*.

Chairman.

1629. I believe you are a Live Stock Agent in Edinburgh?—I am.

1630. What length of time have you been in that business?—Our business began in 1842, and my brother and I joined the firm in 1856.

1631. Can you tell the Committee what the nature of the business is?—We have a large home connection; we sell a great many home cattle, as well as cattle from Ireland and the continent of Europe, and all the American cattle through Messrs. John Bell & Sons, that have come to Scotland. Last year we sold 32,930 cattle, and 175,000 sheep and lambs.

1632. Was that all derived from Ireland or America?—There are 22,058 of those that were home cattle (I mean by that English and Scotch cattle), and there were 2,977 from Ireland, and 7,895 from the Continent, exclusively from Denmark and Sweden. Then we had 171,254 home sheep, and we had 3,796 foreign sheep.

1633. Were these sheep also from Denmark?—We had some from America.

1634. In the course of your business, do you ever have cargoes from other parts of Europe than Denmark, Norway, and Sweden?—We used to get a great many from Hamburg.

1635. Do you deal also in Schleswig-Holstein cattle?—We never have any from Schleswig-Holstein into Scotland; I have seen them, but we have never had any of them. We had a great many from Holland during the time when the ports were open.

1636. Can you give the Committee any idea of what the consumption has been during the last few years?—Yes; I applied to several of the principal market-keepers to see the increase in the number of cattle shown at three periods of five years each. In 1866 the number of cattle in Edinburgh was 18,494; in 1871 it was 36,693; in 1876 it was 39,264. At Glasgow, in 1866, there were 48,294; in 1871 there were 67,131; and in 1876 there were 73,717. At Liverpool there were, in 1866, 112,980; in 1871 there were 122,643; and in 1876 there were 126,074.

Chairman—continued.

1637. How did you procure those figures?—I got them from the official books of the market inspectors, in Glasgow excepted, where the numbers are given by the jacksman.

1638. Those are the official numbers as recorded?—Yes. Then in Newcastle, in 1866, there were 45,209 cattle; in 1871 there were 62,846; and in 1876 there were 103,794.

1639. Proving the increased consumption?—Yes; in Manchester there were, in 1866, 100,610 cattle; in 1871 there were 124,962; and in 1876 there were 167,846.

1640. Are you referring to those figures as the import into this country of foreign cattle?—No, those are the whole quantities shown.

1641. Can you show at all how the consumption of imported cattle has increased?—No; I can only say that at Newcastle, out of the total number of 103,000 shown last year, something like 43,000 were foreign cattle.

1642. Have you seen a large increase in the importation from countries from which you take foreign stock?—Our importations from Denmark have very materially increased within the last few years.

1643. Have the prices increased?—The prices have been gradually going up.

1644. With the introduction of a larger supply?—Yes.

1645. How has the establishment of the compulsory slaughter at ports affected the trade since you have been in business?—At Leith we can get no German cattle, because we have not a defined port of slaughter. The importation of live-stock into Scotland from those scheduled countries is prohibited altogether. If they come at all, they must come as meat, and we have not had any.

1646. Is that by the local arrangements?—It is by the local arrangements, I presume, and also because no cattle are allowed to come alive from Germany at all at present.

1647. But during the time that you have been in the trade you have experienced periods in which

Chairman—continued.

which Germany has been treated as a scheduled country, have you not?—Yes.

1648. During that time did you import cattle at all from Germany?—Yes, largely.

1649. Since that import has been stopped have you found any great want of the cattle from those districts, or has the demand been supplied from other places?—The demand in Scotland has been supplied from other places. We have drawn more cattle, for example, from the feeding districts of Scotland, and of course the demand has been increasing, and we have had a great many live cattle from America and other places.

1650. Under those circumstances, do you think that the protection supposed to be derived from the compulsory slaughter at those ports is one that is necessary for the trade?—So far as regards the slaughter at the ports of debarkation, I do not think that it is protective as to scheduled countries at all, in regard to the health of the stock of this country. Of course, as a natural result, we cannot make nearly so much for the carcases of the animals coming into the market as we can make for them when they come alive.

1651. But in the interests of the salesmen the profit of course is greatest upon the live animal than it is where the animal has to be slaughtered at a particular point?—I am not speaking in the interest of the salesmen with regard to this, because the remuneration to the salesman would be the same in either case; in fact, relatively more in carcase; but we can regulate the markets much more readily and make more of the cattle when they come to the market alive than we can do when they come in carcases, because it is a perishable article, and it has not an actual value attached to it during weather such as this, for example.

1652. With regard to the American meat trade, then, you have had a dead meat trade set up?—A very large trade, to Glasgow.

1653. Has it been continued for any length of time?—It began just this week last year.

1654. Then it went through the summer months?—It did.

1655. Can you speak of the quantities that were imported?—Perfectly. Sometimes as many as 500 carcases of meat a week to Glasgow.

1656. Was that during the hot weather?—No. At first the quantity would be from 50 to 100 carcases per week.

1657. During the months of July, August and September?—Yes, up to about the 1st of November.

1658. How did they arrive in Glasgow; did they arrive under peculiar circumstances of the atmosphere; that is to say, in these new refrigerators?—Yes.

1659. And did you find that those cargoes which arrived during the hot weather arrived in such a condition that you could make a market of them?—They vary very considerably. Sometimes they will make 7 *d.* a lb. to-day, and to-morrow they will only make 3 *d.*, according to condition and weather.

1660. You mean not the same cargo, but separate cargoes?—I saw a cargo sold a fortnight ago on Thursday, in Glasgow Market, and the prices began at about 4¾ *d.* for fore-quarters of beef, and 6¼ *d.* for hind-quarters, and before the sale had finished it was selling at 3 *d.* a lb. out of the same ship.

Chairman—continued.

1661. Was that in consequence of the meat deteriorating from atmospheric causes, or was it because of a glut in the market?—It was partly attributable to the weather, and there was more beef there than the trade could do with at the time.

1662. But the reduction in the price was not all to be put down to the fact of deterioration in the meat?—Not at all.

1663. Having now for many months had to deal with this imported dead meat from America, in your opinion is it a source on which you are able to rely?—No.

1664. Do you separate the hot weather from the cold in that answer?—I am speaking principally of the hot weather. It might continue to come during the winter months, but it is not in such favour in Scotland as it used to be.

1665. And that you believe is in consequence of its uncertainty during the hot weather?—If it is sold at once it looks very well for, perhaps, a day afterwards, but in the course of a day or two afterwards, it decays and loses bloom, and smells badly.

1666. Do you think that that system could be applied to importation from the Continent?—I do not think so.

1667. In coming from the Continent, the period for which it would be kept in this cold chamber, would be less than in the case when it comes from America?—No doubt.

1668. Notwithstanding that, you are not prepared from your experience to say, that it would afford a condition of trade upon which you could rely. We could not rely upon importations of meat in carcase from the Continent.

1669. I suppose that there is a certain amount of depreciation of live stock in transit?—It depends upon from whence they come. From America of course there must be, to some extent, some depreciation in weight, but in the last two cargoes of cattle that we had, which was this last week, we had every bullock landed alive that was shipped. There were 316 of them. I suppose there may be a slight depreciation in cattle coming from America, but cattle coming from the continent I should think, do not perceptibly deteriorate at all, either in weight or value.

1670. What would you give as the relative results, to the consumers and producers, of shipments of live stock as compared with carcases?—With regard to the relative values, in the case of American cattle: first, the price of American cattle in Glasgow last week, we may take at 8½ *d.* or 8¾ *d.* per lb. alive sinking the offal, leaving the beef to stand the butcher in 7¾ *d.*; I allow 1 *d.* a lb. for offal. The beef sent, belonging to the same consigners, was selling last week at an average of 5¾ *d.* per lb., so that the butchers were willing to give 2 *d.* per lb. more for meat of their own killing, from the same country, than for meat which is killed over on the other side.

1671. It was 2 *d.* per lb. in favour of the live animals?—Yes; the expense of transit would be about 3 *l.* 10 *s.* more on the live meat than on carcase meat; but taking the whole cost together, I should say that the amount of money in ordinary cases in favour of the live bullock, is something like 3 *l.* The shipper would receive 3 *l.* more than if it came in the carcase.

1672. The freight is 3 *l.* more?—Yes. In the first place, in regard to the live cattle there is no

Mr. *Swan.*

4 June 1877.

Chairman—continued.

machinery necessary, of course. A live bullock makes 2 *d.* per lb. more in this country, but the expense of fetching it is something like 3 *l.* more than the expense of its coming in carcase, and the balance in favour of the live bullock is something like 3 *l.* or 3 *l.* 10 *s.*, deducting the 3 *l.* excess of expenses.

1673. You spoke of the Danish cattle as part of your import. Can you give the proportion of Danish, Swedish, and Norwegian cattle that are sold to be fattened here?—We do not receive many store cattle from those countries, but we sell a great many of them during the latter months of the year to the farmers. They buy them out of the fat market and fatten them.

1674. From those countries?—Yes.

1675. Will you give the proportion of the number that come over for that purpose?—I should think that during the months of August, September, and October we should sell perhaps 10 per cent. of them to farmers to feed.

1676. Is that a growing trade, because it is only recently that they have attempted to send them over for that purpose?—They do not even send them for that purpose now, but they come cheaper relatively than lean Irish cattle; they have always some condition upon them and they feed pretty well, and our farmers are beginning to like them better than they used to do. Every shipment now we have a good many calving cows, from 50 to 100 a-week, from those countries which we sell to the dairymen. Those are sent in for dairy purposes.

1677. Do they send them in from Denmark for dairy purposes?—Very largely.

1678. I understood you to say that there was an increased proportion of cattle sent in from Denmark and Sweden; can you separate those which are sent over for slaughter as fat beasts and those which come either for store or dairy purposes?—I should think that the proportion of Danish bullocks sold throughout the year would be something like 5 per cent. of the number coming, and I should think that on an average the number of dairy cows is something like 30 or 40 a-week.

1679. A witness from Denmark who has been examined before this Committee stated that almost their entire export was for slaughtering purposes?—So they are; but a good many are bought by farmers and others.

1680. Are they bought out of the fat stock market?—Yes; they are all shown together.

1681. Is that a recent trade?—No, it has been going on for some time. We have sold a good many of them every year for that purpose; we feed a lot of them ourselves, in fact.

1682. Then to a certain extent the farmers are dependent upon that import?—The number is not sufficient to make much difference, supposing that we were deprived of the cattle for that purpose.

1683. As to the countries which are at present scheduled, I thought I understood you to say that it would be a great advantage if the cattle were not ordered to be slaughtered at the ports?—It would.

1684. How would you deal with them there?—In the case of a country where there was no disease, or where our Government had security that the disease would not be imported from that country, I should recommend that they should have free admission here; and where the cattle plague is raging, or where any contagious or infectious disease of that kind exists, I would slaughter them on the other side.

Chairman—continued.

1685. You think that, with regard to an unscheduled country where cattle plague did not exist, there should be no restriction as to cattle circulating?—Certainly not.

1686. But as soon as cattle plague broke out, you would prohibit their entry altogether?—I would.

1687. And if they are slaughtered at all, you think that they should be slaughtered on the other side?—I think so.

1688. Are you able to speak at all as to the danger of import from Germany, and those other countries from which it is at present prohibited?—So far as I know, the health of the stock in Germany is good, and the precautions that they are taking are of the most complete kind; and it appears to me that the consumption of beef in this country is increasing so rapidly, and we are so unable to feed the people, that we should allow those countries from which there is no risk of disease to send their cattle into Great Britain, and where the slightest risk of any such diseases was likely to arise, I would keep them out altogether.

1689. Considering that the cattle plague has been introduced twice already into this country without our knowing of its having broken out abroad, do you think it would ever be possible to arrive at such a state of things as to enable you to have sufficiently early information as to an outbreak?—There is certainly a risk of that kind; but those governments are getting more alive to the necessity, and they are better able to cope with the difficulty than they were formerly. It is their interest to keep down diseases the same as it is ours; and if they can send us healthy stock, and satisfy the Government that they are so, I should certainly allow them to do it.

1690. Then, in fact, you would depend upon a sort of international arrangement between the countries, and you would admit the cattle free unless you had notice of the disease existing?—Yes.

1691. With regard to the complaints that exist as to the health of our home stock, can you suggest anything?—I do not think that the country was ever freer from disease than it is at the present moment.

1692. Are you speaking of Scotland?—Yes, and of Ireland as well, and of England too.

1693. Do you mean with regard to pleuro-pneumonia and foot and mouth disease?—Yes; we have, of course, always in Edinburgh a certain proportion of pleuro-pneumonia in the dairies.

1694. Do you arrive at that opinion from the fewness of the cases that have occurred under your own notice?—Yes; and we have information from all over the country in regard to that.

1695. Have you any dairies in Glasgow and Edinburgh?—Yes, a great many.

1696. Have you had many cases of pleuro-pneumonia in those dairies?—Pleuro-pneumonia is always occurring there. The dairies both in Edinburgh and in Glasgow are licensed by the magistrates to hold so many cows, and of course they are subject to inspection by the market inspector, who goes round occasionally.

1697. Are they allowed to move their animals freely

Chairman—continued.

freely into and out of those dairies?—Where they are clear from disease they are.

1698. They are only allowed to move them when the inspector has passed them as being free from disease?—Exactly; and if a case of disease arises they are not allowed to move them.

1699. And yet you say that pleuro-pneumonia is rife amongst those dairies?—It breaks out occasionally.

1700. And they are a source of considerable danger, I suppose, to the general stock of cattle in the country?—If the disease is there, there must always be a certain risk of course; but where disease exists, no movement is permitted until 28 clear days after its disappearance.

1701. But summing up your evidence, you are in favour of taking off the restrictions and trusting to international communications as between the different countries for protecting us from the importation of disease?—I am.

1702. And you do not believe that the introduction of the American dead meat trade will be sufficiently lasting to enable us to rely upon it for the food of the people?—That is my opinion.

Mr. *Arthur Peel.*

1703. What has been the condition of the Irish cattle that have come under your notice in Edinburgh?—The Irish cattle that came to us last year were on many occasions very bad with foot and mouth disease.

1704. Where would they come from?—From Dublin, principally.

1705. Was there any kind of inspection exercised over them?—Yes.

1706. Where?—At the Broomielaw, at Glasgow, on the Clyde.

1707. You do not agree with Professor Brown, one of the witnesses before this Committee, who anticipated a large development in the dead meat trade?—I think it will fall off; it is impossible to work.

1708. What is the state of the dead meat trade between Scotland and London?—In the winter season a good many cattle and sheep come from Scotland here as dead meat; but I should say that it is a very dangerous experiment for the sender in the summer months.

1709. Is that traffic in dead meat from Scotland to London increasing?—It is developed nearly as far as it can be, I think. There has always been a very extensive trade between Scotland and London in beef from Aberdeen, and sheep from all over the country.

1710. You would prefer the cattle being slaughtered at the port of embarkation rather than at the port of arrival?—If they come from a country from which they are likely to bring cattle plague, I should.

1711. I suppose that there would be a greater risk with regard to the dead meat, would there not, if it had to undergo the long voyage as well?—Certainly.

1712. You said that one of the great evils of the dead meat trade was the change in value, inasmuch as it drops from 7 *d.* in one day to 3 *d.* the next day?—Quite so; you cannot tell its value at all.

1713. I suppose that would operate with greater effect if the cattle were slaughtered in a foreign port?—Certainly.

Colonel *Kingscote.*

Mr. *Swan.*

4 June 1877.

1714. Do you confine yourself to the sale of live stock, or do you sell dead meat also?—We used to sell dead meat when the markets were closed during the time when the prohibition of the movement of live stock was in force.

1715. How long ago was that?—It would be in 1865 or in 1866, I think, when the markets were all stopped.

1716. Then for the last two or three years you have had no experience of the dead meat market?—Only by seeing it regularly sold in Edinburgh and Glasgow.

1717. But I understand that you have never had any experience in the sale of dead meat?—No; not since 1866. I have never sold any of it myself, but I have seen it sold weekly.

1718. And you think that it is carried out at such a loss that it will not continue?—That is my opinion.

1719. Are you aware that at the present moment there are projects to bring dead meat from Vienna and even from as far as Australia?—I have heard so.

1720. Do you think that those schemes would be mooted if there was not a fair chance of success?—There may be, but I should not like to be a partner with them. I think that this country can never be supplied with food by dead meat and carcases with any degree of certainty.

1721. You would sooner run the risk of the animals being knocked about in a storm than have the dead meat brought over?—Out of 7,000 cattle that we had last year from Denmark, we had only 18 casualties altogether.

1722. But is not the proportion of casualty and injury greater in the case of cattle coming from America?—There is a greater risk in the case of cattle coming from America on account of the distance, and there is also greater risk in importing live cattle from America, of course, than in importing them from the continent of Europe.

1723. You say that there is a great quantity of pleuro-pneumonia in the dairies of Edinburgh and Glasgow?—Yes, occasionally.

1724. Do you think that any regulations would prevent that, or would you like to see any regulations with regard to it?—I do not think that any regulations would cope with that, because the ventilation and the situation of so many of them are productive of disease; that is to say, no restrictions with regard to movement would prevent disease breaking out periodically.

1725. If you prohibited dairies in these large towns, would not that have a tendency to prevent disease being spread in other directions?—I think that it would be a good thing.

Mr. *Chamberlain.*

1726. You say that the loss of the German supply has been made up from Scotland and other places?—The loss has been made up in Scotland by drawing from other places.

1727. From other countries?—Yes. As our supply from Germany decreases, of course we are able to sell more Danes.

1728. Has the loss of the German supply affected the price in any way?—With our markets increasing in numbers every year for the last 10 years the prices to the public just now, notwithstanding American meat, are higher than they have been on the average during that period.

1729. Do you connect that with the loss of the German supply?—No; but I wish to show the

Mr. *Swan.*

4 June 1877.

Mr. *Chamberlain*—continued.

the Committee the necessity of encouraging a supply of healthy stock sufficient to meet the requirements of the people, without the risk of disease.

1730. You say that you would slaughter the animals at the port of embarkation in case the country is infected; do you mean infected by cattle plague?—If cattle plague is raging in any country, I would have the cattle killed upon the other side, and not allow them to come here alive at all.

1731. Would you apply that to pleuro-pneumonia?—I would not think so much of that unless it were epidemic in any foreign country.

1732. If it applied to pleuro-pneumonia, Germany would be permanently under that prohibition, would it not?—Yes; cattle plague I should certainly exclude altogether, because I cannot see the safety that this country enjoys if cattle come from the continent with cattle plague upon them. At Deptford, for example, it is no security against disease; it might be spread there very readily.

1733. Do you know whether there are any restrictions in force now upon the movement of cattle in any part of Scotland?—None whatever; they are perfectly free.

Mr. *M'Lagan.*

1734. I suppose that in your business as a cattle agent you have a larger return from selling imported live stock than from selling imported dead meat?—When we were selling meat in the carcase we charged more commission than we do in the live trade.

1735. Have you ever thought which would be the more profitable to the cattle salesman, selling live stock or selling dead meat?—I should think that he would get more profit out of the dead beef than he would out of the live animal.

1736. Therefore it is a matter of indifference to you whether we import live stock, or whether we import dead meat?—Perfectly. If all foreign importations came slaughtered, of course we should require to sell them in carcase instead of selling them alive.

1737. I think you said that the carcase of an animal brings less money than the live animal itself?—It does; the values are not relative.

1738. Therefore for a cattle salesman to get the same profit he would either require a larger commission upon the carcase than he would have upon the live stock, or he must have a great many more carcases sent?—Yes.

1739. And therefore the cattle salesman would require to raise his commission upon all dead meat that came into the country to put him into the same position as the same number of cattle were imported?—The commission is higher already.

1740. You spoke about the Danish cattle; is the number of Danish cows imported on the increase?—No; I think we have sold more in former years than we have sold this.

1741. They were generally used, not for feeding purposes, as I understand, but for dairy purposes?—Yes, for dairy purposes.

1742. Are you aware how the farmers in Scotland like them?—I have sold a good many of them during harvest time, and they do not object to them, so far as I know.

1743. They generally come over in calf, do they not?—Yes, and some of them in milk.

Mr. *M'Lagan*—continued.

1744. But you think that that has not been on the increase?—No, I do not think that it has. In fact, as you know, in Scotland, this year we have been very scarce in all kinds of meat, and of course the demand has not been so great on that account.

1745. Are not the farmers of Scotland at the present time getting into the practice of feeding off their cows without taking the calves from them?—In a general way they do so.

1746 And therefore if that system is continued for any length of time, they will require to increase their stock from other countries, will they not?—Decidedly, in regard to milch cows.

1747. And that is the reason why cows are imported from Denmark?—The trade developed itself; they began to come in small numbers, and they seemed to take well, and then they were shipped in large numbers. The price regulates the supply entirely.

1748. Have you ever heard of any of those cows that come from Denmark being affected either by pleuro-pneumonia or by cattle plague?—Never.

1749. I think you stated that the importation of dead meat, such as it is, from America, could not be extended to the continent?—I do not think it could.

1750. For what reason?—In the first place I do not think that they could supply this country with slaughtered beasts in sufficient quantities or in such condition as to take the place of the live stock.

1751. But might not the means adopted for the importation of dead meat from America be extended and made use of for the importation of dead meat from the continent?—It may be so, but I understand that there is a great difficulty in regard to ice in many parts of the continent; of course I know perfectly well that there is a general feeling among the farmers in our country that the slaughter of foreign cattle is going to release them from all their doubts and difficulties; but I cannot see from experience how this country can be supplied in carcase from the continent or from any other place.

1752. In fact, you do not see how the American plan of bringing over dead meat can be adopted by the people on the continent?—I do not.

1753. And the principal reason why you think that it cannot be adopted on the continent is on account of the scarcity of ice there?—Yes, and the risk of sending it; I have seen a calculation made in regard to the per-centage of foreign cattle which come to this country in reference to the quantity of home stock; but I have always been of opinion that they seemed to calculate it upon the average during the whole year, whereas the cattle from the continent during six months of the year from one of the greatest sources of our supply; and therefore the proportion represented during those six months is much greater than what it is if you put it over the whole year.

1754. What is your opinion of the health of stock just now in this country?—It never was healthier, I fancy, than at the present time.

Mr. *Pease.*

1755. With regard to that price of 7¾ *d.* per lb., which you mentioned as being the price of

Mr. *Pease*—continued.

of American cattle in Glasgow last week, does that apply to the whole of the carcase?—Yes.

1756. At what price was the Scotch beef selling at the same time?—That was 7¾ *d.*, and the price of Scotch beef would be a farthing more; 8 *d.*

1757. What would be the average weight of those American beasts if they came over alive?—I should think about an average of 800 lbs. when killed, or about 1,500 lbs. alive.

1758. Those cattle are sent upon consignment to you to make the best you can of, I suppose?—Yes.

1759. When you return such a price as 7¾ *d.*, is there perfect satisfaction on the part of the consigner?—We have never had any complaints about the results of any sales that we have made from America.

1760. Have you any idea at what price per lb. the American market would supply those cattle in Glasgow?—As far as I understand from the shippers the American beef cannot be sold in Glasgow profitably under 6¼ *d.* per pound.

Chairman.

1761. Is that dead?—In carcase.

Mr. *Pease.*

1762. But taking the live beast?—Taking the live beast, it is as I have shown you before.

1763. And you prefer the live beast to the dead meat, because it can be sent from market to market?—Yes, and if Newcastle has a short market or an over supply we can get cattle from there, or *vice versâ*, to regulate the market as trade requires.

1764. Do you ever hold cattle over from market day to market day?—We seldom do so. We sell out nearly every week.

1765. How many cattle market days have you in Glasgow?—One on Monday and one on Thursday.

1766. How far south do you take those American cattle from Glasgow?—I sent some to Sheffield on Monday last.

1767. What price did they produce in Sheffield?—I should think they were worth about as much in Glasgow as they were in Sheffield; but being able to move them to suit ths trade is an advantage.

1768. What would be the cost of that mode of transit?—The cost of that mode of transit is something like 15 *s.* per head.

1769. That would bring them down something like a farthing a pound, would it not?—Yes.

Mr. *Anderson.*

1770. Is the loss on the importation of live stock from America serious as regards depreciation?—No; for some months in the year we have very little damage, or hardly any perceptible loss whatever.

1771. Is that loss from the wasting of flesh, or is it from the animals getting knocked about by gales?—If there is loss at all there is a risk of loss from both causes; but I should consider that it is the loss of offal more than the loss of beef.

1772. Then in reality the depreciation of flesh is not a serious item in an ordinary voyage?—No, it is not.

1773. Do you consider all these diseases rinderpest, pleuro-pneumonia, and foot-and-mouth disease to be imported diseases?—So far as the

Mr. *Anderson*—continued.

cattle plague is concerned, I have no doubt whatever that that is imported; but I consider that pleuro-pneumonia can be generated, without either contagion or infection from abroad, in this country.

1774. And it always exists more or less in this country?—It does.

1775. Therefore any regulations to prevent importation will not necessarily prevent the existence of the disease here?—Certainly not.

1776. Then your opinion is that our regulations should apply rather to the prevention of the cattle plague being imported than to pleuro-pneumonia?—Quite so; unless the latter is prevalent in any foreign country.

1777. What do you say as to foot-and-mouth disease?—Foot-and-mouth disease is another disease which, in my opinion, is atmospherical. For example, it broke out in Ireland last year where they never allow any foreign cattle to go; and we have no security that foot-and-mouth disease may not break out at any time or at any place.

1778. Then you do not consider that an imported disease either?—I do not. I have seen foot-and-mouth disease come from abroad, but in my opinion it is not an imported disease.

1779. The outbreak in Ireland was not traced to import?—It could not be, because they did not allow cattle to be imported into Ireland; there was no importation of cattle allowed into Ireland.

Mr. *Elliot.*

1780. Have not the restrictions in Germany stimulated the production in Scotland?—Certainly, but we cannot produce anything like the quantity of cattle of a certain class that is required in this country.

1781. We have not had sufficient time to do so, have we?—No, but we export cattle from Scotland to other places.

1782. You say that you think the dead-meat trade could not succeed in hot weather; are you aware that since last June it has every month been increasing in quantity?—Yes.

1783. And that last month is a hot month in America?—Yes, I know that.

1784. How do you account for that?—I account for it in this way: that the parties who have the steamers engaged, have been at great expense in fitting up the refrigerators, and they have the space taken, and, of course, they expect things to improve and they face it up; but you may depend upon it that the trade will go down in hot weather.

1785. The fact is, that it comes?—Yes.

1786. And it is fit to eat?—It is eatable, certainly.

1787. Is it not sometimes the case that the cattle salesman and the butcher have a greater hand in regulating the price of the meat than the consumer?—I do not think so.

1788. The producer sends it, as a rule, to the auctioneer, does he not?—To a salesman, or auctioneer, or sells it himself.

1789. And then the consumer buys the meat, and the butcher very often gets the profit of the hide, and one or two other things, which are not included?—I think the public get the beef very often as cheaply as the butcher has it to give them. There is a good deal of competition in that business.

1790. If the beef could be bought in ordinary

ships,

Mr. *Swan.*

4 June 1877.

Mr. *Elliot*—continued.

ships, would not that very much interfere with the butcher's trade and the salesman's trade?—I do not think so. Independently of all the American meat that has come, we sold 6,000 more cattle last year than we ever did before.

1791. But you are not producers to a large extent, are you?—We pay nearly 3,000 *l.* a year rent. We fatten generally about 2,000 sheep and about 100 cattle every year.

Sir *Rainald Knightley.*

1792. You stated that we could not depend upon the supply of dead meat continuing; to what cause do you attribute that?—Because it is not paying in many cases.

1793. Has there been any diminution lately?—No.

1794. It has been gradually increasing, has it not?—Yes, there has been more coming.

1795. Then why should the supply continue to increase if it does not pay?—I understand that something like 230 tons came to London last Friday. My reason for thinking that it cannot continue is simply that here is an account of a lot of meat which was sold on Friday. The price ranged from 4 *s.* 3 *d.*; that is 6½ *d.* per lb. for the best to 3 *d.* per lb. for a large proportion of it. My opinion is, that that trade can never continue, because if they can get 7¾ *d.* or 8 *d.* per lb. for the beef coming alive, it is not likely that they will send it here dead for 3 *d.*, and run the risk of its being condemned altogether,

1796. Then you think that the supply in England will not continue to increase?—That is my candid opinion.

1797. Because the price of meat is going down?—The price of meat is getting higher, but this meat is not coming in marketable condition.

1798. Do you think that it will continue to come in the summer months as well as the winter months?—It may come in the winter months, but I do not think that it will come in the summer months.

Mr. *James Corry.*

1799. Do I understand you to say that the importers of the meat adopt the refrigerator principle at their own expense?—Yes, I believe so.

1800. I was under a different impression; I thought that the owners of the ships fitted up the refrigerators, and that the importers paid the freight for the carrying of the meat?—I was told to-day by one of the largest exporters from New York, the nephew of Mr. Samuels, that the exporters engage so much space at, I think, 30 *s.* a ton measurement on board the ship; that they provide the ice, and also fit up the refrigerators at their own expense.

1801. In the importation of live stock are you aware whether any special arrangement is in existence with regard to the fitting up of the ship?—The shipper of live stock pays for the fittings in most cases.

1802. Are you aware of that from your own personal knowledge?—I know that in the case of the last lot of sheep that we had, we had to sell the fittings when the beasts arrived.

1803. Do you import from America, yourself?—No, we sell them on commission.

1804. But you have consignments from America?—Very large consignments; we had 320 cattle last week.

Mr. *James Corry*—continued.

1805. From what part of America did those come?—From Montreal.

1806. They were from Canada then?—Yes, but we have sometimes large quantities from New York as well.

1807. Do they go direct to Glasgow?—Yes.

1808. The fittings for the live stock you say you sold?—The fittings for the live stock were sold for the benefit of the shipper of the cattle.

1809. Is that trade increasing?—It is.

1810. And likely still to increase?—We think so.

1811. You think that the import of dead meat is not likely to keep up, but that the import of live stock is likely to increase?—Yes.

1812. You think there is a difference of about 2 *d.* per lb. in favour of the live stock?—Yes.

1813. Are you aware what the freight of the live stock is?—From Montreal to Glasgow it is about 7 *l.* per head of live cattle.

1814. And from New York?—From New York I think the freight is 30 *s.* per ton measurement of 40 feet for carcases.

1815. I think you said that last year cattle which came from Ireland were in considerable numbers affected with foot-and-mouth disease?—Yes.

1816. Was there no examination of those cattle at Dublin?—Yes, I believe there was.

1817. And they were passed in Dublin?—I believe so; they came at any rate.

1818. Were they inspected again at the Broomielaw in Glasgow?—Yes.

1819. And sent on to Edinburgh?—Yes, a bullock suffering from foot-and-mouth disease is sent up in the machine to the slaughter-houses, and the balance of the cargo is allowed to go anywhere they like, either to feed or slaughter.

Mr. *Torr.*

1820. Alluding to that foot-and-mouth disease in Ireland, do you say that it was a spontaneous outbreak?—I think so; it was limited to the Irish cattle.

1821. Do you know at all how it originated?—No, but it is not difficult to conceive. A great number of the Irish cattle are very much more liable to take it than either the English or the Scotch cattle.

1822. You do not know how it originated?—It originated about Dublin, I think. The cattle shown in the Dublin market last year were almost certain to bring it to this side of the channel.

1823. You think it originates to a great extent in the Dublin market?—It did so last year, I think.

1824. You have given the Committee a good deal of information about the relative prices of dead and live stock; have you any interest yourself in importing them one way or the other?—Not otherwise than in selling them on commission.

1825. You spoke about selling them, and stated that the difference per head between cattle alive and dead was about 3 *l.* per head in favour of the cattle imported live from America?—Yes.

1826. How do you arrive at that figure?—We sell a bullock at so much, say 28 *l.* alive.

1827. You are speaking now as a cattle salesman in your own trade?—I am speaking individually as it were. I sell a bullock say at 28 *l.* alive; that we calculate at 82 *s.* per cwt.; that makes

Mr. *Torr*—continued.

makes 8¾ *d.* per lb. for the animal. We take off 1 *d.* per lb. for his offal, which leaves the bullock at 7¾ *d.* for the carcase as it hangs; then the four quarters of the carcase of the bullock are fetching this morning 5¾ *d.*; so that the difference between the value of a bullock killed in England and of one arriving dead from America in carcase amounts to 2 *d.* per lb.; that is to say putting the 5¾ *d.* for the dead meat against the 7¾ *d.* for the live animal slaughtered here.

1828. Do you consider that 5¾ *d.* was not an exceptionally low price?—No, there were some sold the week before at 3 *d.*

1829. But that was probably not in sound condition?—American meat will decay, but it rarely stinks; 3 *d.* a pound for the meat which I saw sold was a fair market price according to its condition and risk to the buyer.

1830. But it was not in good condition?—I want to show you that you have no certainty of its coming in good condition.

1831. Are you aware that beef is selling to-day at 9 *d.* to 10 *d.* per pound?—I saw some very good hind quarters sold on Saturday at 4½ *d.*

1832. But that is not an answer to my question; are you aware that the selling price to-day of beef in the Liverpool and other markets is 9 *d.* and 10 *d.*?—Do you refer to the retail price.

1833. I mean in many of the establishments where they sell nothing but imported meat; I ask you whether you are not aware that the average price of this now is from 8 *d.* to 10 *d.* a pound, according to the quality?—No. Not ex ship.

1834. No, as they come?—I never heard of hind quarters being worth 8 *d.* or 10 *d.* a pound, but I should suppose that the butcher would require to get that for it at the retail price to pay him.

1835. That is the fact which has been stated before this Committee?—I know what you mean, but I never heard of an American beef salesman, as I may call him, making 9 *d.* or 10 *d.* per pound for hind quarters of beef.

1836. From the manner in which you gave your evidence with regard to the relative value of live-stock and dead-stock imports, you really made out a difference of nearly 50 per cent.; that is to say, the difference between 5¾ *d.* for dead meat and 7¾ *d.* for cattle imported alive; if the Committee were to take that as evidence of the general import, do you think they could rely upon that as the average, not only in Glasgow, but at Liverpool and other importing places?—I should consider that the American live cattle sold in London to-day, as compared with the last cargoes of American dead meat, would realise more than that difference which I have given you, taking the sales on Friday last, for example, in the dead meat market.

1837. You have told the Committee that your business is that of a salesman of live cattle and sheep?—It is.

1838. And therefore your experience, I presume, would be more to be relied upon as a salesman of live cattle than in respect to dead meat?—I have been at nearly every sale of American dead meat which has taken place at Glasgow yet, and therefore I know pretty much about it.

1839. Have you ever gone into the calculation yourself as to the relative cost of the dead carcase and the live one coming to this market?—I have.

Mr. *Torr*—continued.

1840. Can you tell us what the relative cost is?—The cost of a carcase of beef coming from America, including the selling, is something like 5 guineas, according to my information.

1841. What does that include?—That includes ice, space, commission, and the expense of bringing the meat to market on this side.

1842. From the time that it is put on board in America to the time that it is sold here?—Yes, from the time it is put on board in America until its sale in this country.

1843. That, of course, includes freight?—Yes.

1844. What is the expense connected with a live animal from the same port?—From the same port I should think the cost is about 8 *l.* 15 *s.* We generally calculate it at that figure.

1845. £.8. 15 *s.* for the live animal as against 5 *l.* 5 *s.* for the dead animal?—Yes.

1846. You stated that you thought that the supply of dead meat could not be carried on at that rate; that it would not continue?—I said so.

1847. You simply base that upon the relative profits of the dead and live cattle?—I derive my opinion from this fact, that it cannot be a safe business when it is worth, we will suppose, 6½ *d.* to-day, and 2½ *d.*, to-morrow, per lb; the meat of itself is a first-class beef, and were it presented in same condition as home killed meat of same quality, 6½ *d.* per lb. is under value for it.

1848. The import of meat is as much a commercial operation as the import of cotton, and, therefore, it will be determined by its ultimate issue, whether it is profitable or not?—Yes, it will come if it pays, and it will stop if it does not pay.

1849. You do not think that the import of meat will be a profitable trade?—I do not think it will continue as it is coming just now.

1850. There is one other question which I wish to ask you; you say the consumption of beef in this country is increasing faster than we can produce it, in the way of breeding?—Yes.

1851. Do not you think that if we could find means to stop the increase of this cattle plague, it would greatly increase the supply of our own stock; that is to say, that the existence of the cattle plague is a discouragement to breeding?—Decidedly it is.

1852. Then if we could stamp out or stop the import of cattle plague, would not that materially tend to increase the supply of beef in this country, by encouraging breeding?—I think that anything which can keep out the cattle plague from this country, is perfectly right to be adopted. Breeding is not gone into in Scotland, nearly so much as it used to be. I do not know whether that is to be attributed to the risk of disease or not, but that is the fact.

Chairman.

1853. I understood you to say just now, that five guineas represented the expense connected with the dead carcase?—Yes.

1854. And 8 *l.* 15 *s.* represented the expense connected with the live beast?—Yes.

1855. Does that amount include freight?—In both cases.

1856. In your previous evidence, you stated, I think, that from Montreal to Glasgow, the freight was 7 *l.* 10 *s.*?—£. 7, I think.

1857. And the whole expenses connected with the live beast, amounted to 8 *l.* 15 *s.*?—Yes.

Mr. *Swan.*

4 June 1877.

Mr. *Arthur Peel.*

1858. What was the cost of the beast at starting?—We have no information upon that point; they do not tell us.

Chairman.

1859. You stated that you did not think the import of dead meat could continue as it is coming just now?—Quite so.

1860. Where was your experience gained; in London?—In London, Edinburgh, Glasgow, and everywhere else where I have seen it sold.

1861. And yet the import has increased steadily?—Yes, it has.

1862. Are you aware that the import in the last three months shows a very large increase?—Yes; but I spoke to one of the principal importers who ships from America (they call him Toffey, I think), and he told me that the price of beef that day was a ruinous business, and that it took 6 ¼*d.* to pay the sender.

1863. Is the meat which is sold in the various markets kept in the chamber in which it is brought over, or is it taken out at Glasgow where it is landed, and sent on by rail to Edinburgh, or wherever else it may be sold, before it is sold?—It is taken out of the chamber and sent on by rail.

1864. Do you conceive that, supposing the trade grew, and the conveyance of that meat could be ensured in the same atmosphere in which it made its voyage, to the market where it is to be sold, that state of things would continue?—I think so. Directly it is exposed to the atmosphere for 24 hours, it does not matter whether it is warm weather or cold, it begins to sweat, as they term it; it looses bloom, and gets very quickly out of condition.

1865. But you would be able to sell it during that 24 hours, just in the same way as you are now obliged to sell meat in hot weather which you must get rid of during that time?—Quite so; it would require to be consumed during the 24 hours.

1866. But could not you retain it in the chamber in which it arrives, where it may continue sound for any given length of time, until the time when it was required for sale in the market?—Yes. Messrs. Bell, when they get a cargo of meat, take as much out of the chamber as they require for the Glasgow market; then they leave the balance of the meat in this chamber until they require it again for sale, which may not be for two or three days.

1867. Does not that point to the fact that the loss which you describe in the way of depreciation is a question of the mismanagement of it,

Chairman—continued.

and that if it could be treated as Mr. Bell treats it, namely, by allowing it to remain in the cold chamber until you had a sale for it, you would be able to use the dead meat as well in every instance as during 24 hours after it arrived at the port?—No, I cannot see that this trade can go on at all in this way, especially with steamers from the Continent, which require to make repeated passages.

1868. Do you admit that there is a sale for this meat if it is brought out within 24 hours after it arrives?—Certainly; it can always be sold at some price.

1869. And you admit also, do you not, that if it can be kept in that same atmosphere it will continue for almost any length of time to remain sound?—Yes, I suppose it would; but I cannot speak upon that point.

1870. Then supposing you can arrive at the point of retaining the meat in the chamber until you have a sale for it, would you not derive the same benefit from that meat then as you admit you do now in the first 24 hours?—I think the meat could be kept very likely twice as long again as it is after coming from America, if retained in the same atmosphere, but after it is exposed to the ordinary atmosphere it very soon begins to fall off.

1871. Does it not result in what I have just asked you, namely, in a question of management only, and that you should keep the meat until you have a sale for it in the atmospheric condition in which it is likely to remain sound. You complain that the meat after a certain period of exposure becomes unfit for sale, but you admit that the meat is fit for sale for 24 hours after it is taken out of the chamber in which it arrives?—Yes, that is so.

1872. Could not you create a state of things in the train by which you could carry the meat almost in the same atmospheric condition until you have a sale for it?—But you would require to create that condition in the shops as well.

1873. The shops have to deal with meat in hot weather in the ordinary case?—Quite so; but meat is better for keeping when slaughtered on the spot than when brought from a distance.

1874. You are aware that the shopkeepers complain now that they can only kill meat in the summer-time for the day's consumption; that is rather against what you have just been stating?—No, the home meat would keep better than the meat imported would.

1875. And yet the dead meat will keep for 24 hours after it is exposed to the atmospheric influence?—Quite so.

Wednesday, 6th June 1877.

MEMBERS PRESENT:

Mr. Anderson.
Mr. Assheton.
Mr. Chamberlain.
Mr. Chaplin.
Mr. James Corry.
Mr. Wilbraham Egerton.
Mr. Elliot.
Mr. W. E. Forster.
Mr. French.
Mr. John Holms.
Colonel Kingscote.
Mr. M'Lagan.
Mr. Murphy.
Sir Rainald Knightley.
Mr. Norwood.
Mr. Pease.
Mr. Arthur Peel.
Sir Henry Selwin Ibbetson.
Mr. Torr.

SIR HENRY SELWIN IBBETSON, BART., IN THE CHAIR.

Mr. MARK WHITWILL, called in; and Examined.

Chairman.

1876. I BELIEVE you are the Managing Owner of some steamers trading between Bristol and New York?—I am.

1877. Have you had any dealing with the new trade which has been created for sending over dead meat to this country from America?—In each of the steamers I have let off a portion of the space for the purpose of having one of the meat-rooms fitted up.

1878. Is that letting a letting to the patentees of a company possessing these refrigerators, or is it a letting to some trader who supplies the meat?—The patentee hired the space, and fitted up the meat-room, and sends the meat.

1879. The consignment of the meat and the room in which it is consigned to this country, are one concern?—Yes.

1880. So that you yourself have nothing to do with it, excepting letting the space for the purpose in your steamers?—I have something to do with it, because the shipper of the meat has asked me to act as agent for him in Bristol.

1881. Then you are practically acquainted with the working of the process?—Yes; so far as one can be in a short time.

1882. Can you state how the chambers are kept at an even temperature?—Yes; there are coils of pipes on every side of the room, and a coil down the centre of the room. Those pipes are filled with intensely cold water, and that water is produced by the dissolving of ice by salt. The ice and salt are placed in a tank; the water that flows is pumped by a small pump placed there for the purpose into those pipes; and the cold water is kept in constant circulation.

1883. The object being, I suppose, to maintain an even temperature?—Yes.

1884. Can you tell the Committee what the required temperature is?—It is important that the temperature should not sink below 34 degrees, and it is desirable that it should not rise above 36 or 37 degrees; but, as a matter of fact, it does sometimes rise beyond that temperature.

1885. I suppose the principal object is to maintain it without much fluctuation?—That is of very great importance.

Chairman—continued.

1886. When did this trade first begin at Bristol?—In April of this year the first consignment arrived. On board the first boat there were 102,464 lbs. of beef.

1887. Do they consign mutton as well?—They have done so on two occasions.

1888. I suppose the meat that is sent over in the chamber is not packed close, is it?—Not very close; the meat is in quarters, and each quarter is sewn up in coarse bagging, and is suspended by a hook from the roof. It is important that the meat should not be packed too closely.

1889. So that the air may circulate freely throughout the compartment?—Yes.

1890. You stated that on the 3rd of April you had your first consignment; have you had regular consignments since that time?—On the 17th of April there was another consignment, and on the 30th another, and on the 21st of May another, and on the 28th of May another.

1891. Do you receive them now weekly?—About once a fortnight we reckon upon receiving them; but sometimes it happens, from various causes, that the steamers overlap each other a little.

1892. You stated that on the 3rd of April the cargo consisted of 102,464 lbs.; has that quantity been maintained or has it increased?—The room was filled on that occasion.

1893. Was that the total quantity brought in one steamer?—Yes.

1894. Then that is the amount that you would be able to import in one steamer?—Yes. Of course the rooms in the steamers are not precisely the same size. The five consignments consisted of 546,810 lbs. of beef, and there have been two consignments of mutton.

1895. That is the amount which you have brought in since April 3rd?—Yes.

1896. Is there any other direct import of American dead meat into Bristol?—There is no other direct import into Bristol.

1897. Speaking from your experience, though

Mr. *Whitwill.* 6 June 1877.

Mr. *Whitwill.*

6 June 1877.

Chairman—continued.

it is not of very great length, have you found that the cargoes arrive in good condition under those circumstances?—Some of them arrive in excellent condition, and I believe that they all might arrive in good condition if thorough care were observed in every respect.

1898. Do you mean that in certain instances where that has not been the case it has been from the fault of the packing, or from some other reason?—I consider that on one occasion there was rather too much meat put into the chamber; the meat was rather too closely packed.

1899. It depends, I suppose, entirely upon maintaining this free circulation of air round each particular parcel?—Yes, and having the chamber properly cooled before the meat is put on board.

1900. Those are difficulties which, with experience of the trade, can be easily overcome?—I think so, quite easily.

1901. Do you believe that as the experience of that trade grows it will be one which will develop itself into a certain trade?—I think it will. I may say that, so far as I can ascertain, there is no prejudice whatever in Bristol on the part of the consumers with respect to the meat.

1902. But from your own experience, and from what you have seen of the cargoes, for which I understand you to say you are the agent, have you seen sufficient to justify you in saying that you believe it is possible to introduce this meat in a condition permanently in which you can rely upon the cargoes arriving fit for food?—I think so, certainly.

1903. With regard to the trade in this meat, after it has arrived, have you been able to dispose of these cargoes in the immediate neighbourhood of Bristol?—No, not of the whole.

1904. Have those portions of the cargoes which you have been able to dispose of in the neighbourhood of Bristol turned out satisfactorily?—Yes, I may say that those dealers who have bought the meat once have purchased it again.

1905. They have continued customers in consequence of being satisfied with the first purchase?—Yes.

1906. Will you give the Committee the price at which the meat has been put upon the market?—The highest wholesale price has been 6¼*d.* per pound. I am now speaking of the whole side; the fore and hind quarters of the animal together.

1907. Has it fluctuated much?—I think the lowest price which they have taken for a side has been about 5¾*d.* per lb.

1908. During the whole time that you have imported this meat, since April, you have found a ready sale for a portion, at all events, of the cargo in Bristol itself?—Yes.

1909. You have found no difficulty in getting rid of it, although in the same market there was meat fresh killed by the butchers?—I stated just now that we are not able to sell the whole of it; we have sent part of it away to a distance.

1910. With regard to that which you have sent away, have you sent it to any distance?—We have sent it to London.

1911. Has it been sent to London under the same atmospheric conditions as those under which it arrived at Bristol?—No; it has been sent in the ordinary railway van.

1912. Are you able to tell the Committee what the results of your sales in London of those portions of the cargo have been, and whether they have been received at their ultimate market in London in the same fair condition?—I have had nothing to do with the sales which have taken place in London. When the meat is sent to London the agent of the shipper in London deals with it.

1913. Can you tell the Committee what time elapses between the meat being taken out of the ship, and therefore out of the atmosphere in which it was brought over, and its being delivered on the market in London?—Yes; it leaves the ship about half-past two or three o'clock in the afternoon, and is delivered at Smithfield between four and five o'clock, I think on the following morning.

1914. I suppose it is offered for sale in the early morning of the next day?—It is so.

1915. But 14 or 15 hours have elapsed since it was taken out of the cold air in which it was brought over?—That is so.

1916. You stated that you had not yourself had any complaints of the meat that you have so sent forward?—Some of the meat has not turned out so satisfactorily as one could have wished. As I stated, in one case the meat was too closely packed.

1917. That, I understood, applied quite as much to what you sent forward as to what you sold in Bristol?—Yes.

1918. Are you satisfied that, removing it from the cold atmosphere, you can send it by rail for any number of hours without prejudicing it?—I think it is not affected by the 14 or 15 hours that it would take.

1919. Have you tested that which you have had under your own control in Bristol as to the time for which you could keep it before sale after it was taken out of the ship?—No; because I allow it to remain in the meat-house until it is sold. We do not take it out and let it remain outside; we sometimes keep it on board five or six days, keeping the room at the proper temperature.

1920. If you keep the room at the proper temperature, you believe that you may keep the meat for an indefinite time in that room, and that it will come out in the same condition for sale as it does on its arrival after the voyage?—Certainly. I would qualify that by saying that, opening the door two or three times a day, and consequently letting in warm air, does somewhat affect the meat; but if the room were hermetically sealed, I believe the meat would keep for an indefinite time.

1921. Under those circumstances, supposing that the trade develops, and that it is possible to send the meat over in this cold chamber in such a condition that it can be taken out of the steamer, and sent to any point where it may be sold, you believe that it would arrive there in such a condition as to meet with a ready market?—Most certainly.

1922. And you have found that to be the general result, with the exception, as I understand you, of one instance, in which you attribute the deterioration of the meat to the bad way in which it was originally packed?—Yes, but the meat has varied in condition. No two consignments have ever been precisely alike in quality. For instance, one consignment was unexceptionable; there was not a quarter in the whole

Chairman—continued.

whole consignment that was in the least degree injured.

1923. Was that the first consignment?—That was the first.

1924. Have you found a falling-off, then, in the quality?—The second boat was the one in which, I think, they tried to put too much meat; it was too closely packed, and I attribute the damage entirely to that cause. In the next boat the ice ran rather short before the boat arrived; they did not put enough ice on board, and the same remark applies to the fourth consignment. There was scarcely enough ice put on board; it ran short before the ship arrived.

1925. All those faults seem to be faults which are really to be overcome?—Yes; I believe every one of the faults may be most easily overcome by proper care.

1926. And if the same conditions were carried out, you believe that this meat may be sent all over the country in a condition which would render it fit to compete with fresh-killed meat in the London market?—I do. I see no reason why every consignment should not be equal in quality to the first consignment which we received.

1927. Has the price been maintained throughout at about the same amount?—Yes; the meat that arrives in thoroughly good quality can be sold at from 6 *d.* to 6¼ *d.* per pound, depending of course upon the quantity that happens to arrive in Liverpool or Glasgow at the same time.

1928. Do you know what the prices have been which those portions of cargoes have fetched that have been sent up to London?—I do not know what prices they have fetched.

1929. I suppose that the price must be maintained at something like that which you have quoted, in order to make it pay?—I am told that it must.

1930. Are you aware what the original cost price in America is before it is sent?—I can only speak from hearsay as to that.

1931. I think that is all the experience that you have had with regard to this particular branch of trade?—That is all the experience I have had.

1932. Is there any other point which you would wish to put before the Committee?—I think not. I might say that the shipper of the meat is at present in London, and I think he might give you very valuable information if you choose to summon him.

Mr. *Assheton.*

1933. Can you tell me what is paid for this chamber on board the ship?—Thirty shillings per ton of 40 cubic feet.

1934. Do you know what is the freight per carcase?—I think the freight would work out to something like 1 *d.* a pound, reckoning roughly the quantity of meat that they put into the chamber, and the amount of freight that they pay me for bringing it. They do not pay me by the pound, but by the space which they occupy.

1935. Do you think that 1 *d.* a pound would include the whole cost that a person buying a carcase in America and shipping it to Bristol would have to pay?—No; he has to provide the meat-room with ice, and the engineer to look after the engine and the meat-room. The engineer must be in constant attendance, because the

Mr. *Assheton*—continued.

chamber must be looked at every two hours at least, to watch the rise and fall of the thermometer.

1936. Do you know at all what the other two charges for the ice and the engineer will come to?—I cannot tell you at all, but ice is not an expensive item in America; it is a very few shillings a ton.

1937. Is the American ice colder than ice elsewhere?—I do not know.

Chairman.

1938. Is it not frozen at a less temperature than other ice, and therefore does it not remain in the form of ice for a longer period?—I cannot answer that question; it comes in very large blocks.

Mr. *Assheton.*

1939. Can you give me any information as to the cost of bringing a live bullock from America to Bristol?—I have not brought any live bullocks from America, but I have occasionally taken some prize cattle out, and I have charged from 15 *l.* to 20 *l.*, according to the size of the animal.

1940. Those were cattle, I presume, for breeding purposes?—Yes.

1941. And they were cattle, therefore, of quite a fancy price?—Yes. I suppose it probably would not answer to pay that freight for inferior animals; but, on the other hand, it would not pay me to carry them for less.

1942. Then do I correctly understand you that you have had no experience, and can give me no information, as to the price of bringing over live cattle, such as they kill now, to send in the form of dead meat?—No, because I have had no occasion to go into the matter. Bristol being a prohibited port, we are not allowed to import live cattle into it, otherwise I should have calculated how much I could afford to bring animals for.

1943. Have you noticed any difference in colour between the meat that has been brought from America and the meat that has been killed in England?—In that which has arrived in thoroughly good condition there is no difference at all in the colour.

1944. Do you think, then, that if there is some difference in colour, it is owing to some partial failure of the process?—I do.

Mr. *Elliot.*

1945. May not the 1 *d.* per pound which you say is charged be increased if the ordinary freights are very much higher?—The freight that is charged of 30 *s.* per ton of 40 cubic feet is a good average rate of freight; it is decidedly above the present rates of other cargoes.

1946. Therefore you think it is possible to have this meat carried even cheaper than at 1 *d.* per pound?—I do not know that the shipowner would care to have the space in a ship permanently occupied for much less, because he would take his chance of freight. I believe that about 27 *s.* 6 *d.* a ton is being paid on board some steamers.

1947. Can they raise and reduce the temperature of the cells at pleasure?—Yes; the engineer can do so by putting an extra quantity of ice, or a smaller quantity of ice, as the case may be.

Mr. *Whitwill*, 6 June 1877.

Mr. *Elliot*—continued.

1948. Can you do it quickly?—Yes, I am told that it does not take long. If he finds the temperature rising, he puts another lump of ice and a little more salt into his tank.

1949. You could bring a whole cargo, could you not, if necessary, if the ship was properly fitted up as a meat-ship alone?—No, you could not, because the vessel would not be in seaworthy trim with an entire cargo of meat; she would not be down deep enough in the water.

1950. You might bring a larger quantity, might you not?—You might bring a larger quantity, certainly.

1951. If railway vans were properly constructed, I suppose they might carry meat to all parts of England on the same principle?—Yes, I should think so.

1952. Has there been much loss sustained by the persons sending the meat in consequence of the damaged cargoes?—I cannot tell you what loss they have sustained: if you send for the gentleman I have suggested, he may be able to tell you.

Mr. *Norwood.*

1953. Your experience is confined to this spring, is it not?—It is, entirely.

1954. And you have had five shipments?—Yes.

1955. And out of the five three were indifferent in quality?—I scarcely like to commit myself to such a statement as that; they were not so good as the first.

1956. Three of the deliveries were not quite in prime condition, were they?—They were not so good as the first shipment, decidedly.

1957. Do you anticipate that you will be able to continue this trade when you get to the month of July, for instance?—Yes, I think so, because the same shipper of the meat sent meat last August into either Liverpool or the Clyde in prime condition in the very hottest weather, so he told me.

1958. I believe the rule is that the shipowner is paid whether the chamber is occupied or not?—Yes, they pay for the space.

1959. How large are the chambers that you have erected?—They measure about 250 cubic tons.

1960. So that you run no risk?—No, we run no risk at all.

Mr. *John Holms.*

1961. You say, I think, that this only forms a part of your cargo?—Quite so.

1962. And that would be generally the plan upon which this trade would be likely to be carried on?—I think so.

1963. What proportion of the cargo would be dead meat?—About one-tenth part of the space of the ship would be so occupied.

1964. How long does it usually take you to discharge the other cargo, apart from the meat?—About five days.

1965. You spoke of a chamber carrying 250 cubic tons; is that one chamber?—One chamber.

1966. You spoke of the difficulty of keeping the meat in good condition, unless the chamber was hermetically sealed; that is to say, that the opening of the door from time to time might tend to cause the meat to become unwholesome?—Every time the door is opened it does a little mischief.

Mr. *John Holms*—continued.

1967. Would it be possible to divide this one chamber into many chambers; that is to say, would you be able to open one chamber at a time, and so supply the public during those few days that you were discharging your cargo?—It would be possible, certainly. I think it would add to the safety, decidedly, but it would, of course, add to the cost of fitting up.

1968. Things of that kind are only to be arrived at by experience?—Yes.

1969. You have only tried it for a couple of months?—That is all.

1970. Is it the case that the meat put on board those boats is cooled before being put on board, and that therefore it is in a better state on arriving here for standing the climate, even if the weather is hot, than fresh meat killed here?—I am not aware that it is.

1971. As regards the quantity, you say you believe there will be sufficient quantity to maintain a trade; could you give the Committee any idea of the quantity of meat which is likely to be provided by America?—I believe there is scarcely any limit to the quantity America could supply, the question is, I expect, one of price.

1972. Have you any idea of what quantity is likely to come in?—We have had about 500,000 lbs. of it in two months; that would be something like 3,000,000 lbs. a year in Bristol.

1973. But do you know anything about the supply on the other side?—No; I suppose that it is unlimited. I can imagine the price going up so much on the other side as to interfere very much with the trade.

1974. A good deal is said about the loss that arises from the importation of dead meat through the poor not getting the offal; have you any idea what the proportion of offal would be, say, of an ox of 700 lbs. weight?—No, not the slightest; I know nothing about that.

Mr. *Anderson.*

1975. When you said that $5\frac{3}{4}d.$ per lb. was the lowest price at which you had sold the meat wholesale, do you mean that that was the price at which you sold what arrived in bad order?—To be very candid, that which arrived in not very good order was sent up to London, and was not sold in Bristol at all.

1976. Does the $5\frac{3}{4}d.$ represent the lowest price that was paid for any of the meat?—No; I expect that what is not in very good condition fetches a lower price.

1977. I think you said that you understood that unless from $6\frac{1}{4}d.$ to $5\frac{3}{4}d.$ per lb. could be averaged, the trade would not pay?—I am told that it would not.

1978. Then if a cargo came in bad order, and had to be sent to London, and sold for a much lower price every now and again, it would materially interfere with the profit, would it not?—There might be a very heavy loss, certainly.

1979. Have you heard of any such heavy losses being sustained other than the one that you spoke of where you sent the meat to London?—I have heard it stated (of course I do not know it of my own experience) that considerable losses have been sustained.

1980. You do not know at all what the price was at which the meat in bad order was sold?—No, I do not know; I cannot say that I have not heard

Mr. *Anderson*—continued.

heard it as a matter of gossip, but it did not come before me officially.

1981. There is reason to suppose, is there not, that if the selling price of all that was sold at Bristol, and all that was sold in London, was averaged, it would not be an average of 6¼ *d.* to 5¾ *d.* per lb.?—I should think it would be something considerably less.

1982. And in that case you suppose that it cannot have paid?—Probably not.

1983. I think you said that you would give the Chairman the name of the shipper, and perhaps we can get that information more fully from him?—Yes, I will do so.

Mr. *Arthur Peel.*

1984. Have you ever noticed any very serious fluctuation in the price of the dead meat from day to day?—I have noticed quotations of considerable fluctuations in the market, but I think only from about 5¾ *d.* to 6 *d.*

1985. You have never noticed anything like what the preceding witness stated of the price being 7 *d.* to-day and 3 *d.* to-morrow?—No; I do not think that the whole facts were put before you then, because the meat which was sold at 3 *d.* must have been some that arrived in very inferior condition indeed; the meat of good quality does not fluctuate in price so very much. Of course on some days a large importation may arrive into Liverpool, and the meat may fall perhaps a halfpenny a pound.

1986. Did I correctly understand you to say, that for 14 or 15 hours after the meat was taken out of the chamber it remained good?—Yes; so far as I understand, it does not suffer at all in that time.

1987. How is that consistent with the fact that every opening of the door in the refrigerating chamber, deteriorates the meat?—Because the admission of the warm air into the chamber alters the whole condition of the room, and moisture is precipitated on to the joints, and it makes a softness.

1988. But when the meat is taken out of the refrigerating room, and exposed in a railway van for 15 hours, does it not deteriorate?—The conditions are very different. You let warm air into a very cold room and shut it up again, and then you open it again and let more warm air in, and as soon as the room is shut the freezing process goes on again; and I think that does the meat more injury than staying for a few hours out of doors.

1989. Have you noticed whether the meat, when it goes bad, has the property described by a previous witness, that it decays without a smell?—I have not heard it.

1990. If the meat sent from Bristol to London started from Bristol in a bad condition, I suppose it would arrive in London in a very unpleasant condition?—I should scarcely call it bad condition; it was bad as compared with the best; it was not prime.

1991. It would arrive in London in a very bad condition, I suppose, in such a case?—No, I think not.

Mr. *Chaplin.*

1992. Out of the five cargoes that you imported, I understood you to say that three were indifferent as compared with the first two; was it with regard to the natural quality of the meat, or the condition in which it arrived?—I should think it was not the quality; I have no reason to suppose that the quality was not the same.

Mr. *Chaplin*—continued.

1993. Have you had any experience of the trade during the very hot weather?—No.

1994. Do you anticipate any difficulty in continuing it successfully?—No, because I do not think that the heat of the weather affects the meat at all whilst it is in the chamber.

Mr. *W. E. Forster.*

1995. Were those three ships that brought cargoes of rather worse quality, the last that arrived?—Four out of the five have not been so good as the first, but still it was only here and there that you would meet with a joint that was not so good as the others; it was not that the whole of the meat throughout the whole consignment was indifferent.

1996. The average price at which those consignments have sold in the Bristol market has been 6¼ *d.*, I undsrstand?—Sixpence farthing, 6 *d.*, and occasionally 5¾ *d.*

1997. When the American meat was selling at 6¼ *d.* per lb., what was the price of English grown meat?—I do not know what the wholesale price of English meat was at the time.

1998. Do you know from what part of America the cattle come that are exported?—I think from Kansas, but I am not quite certain.

1999. Then they have a long railway journey before they get to New York?—Certainly.

2000. Do they arrive alive at New York?—They arrive at New York alive, and they are kept at New York, I am told, a day or day and a half before they are slaughtered.

2001. Do you know what is the length of the railway journey?—I do not.

2002. Do you know whether they are driven any considerable distance to the railway station?—I do not; I believe they are slaughtered just outside New York, in New Jersey, at the public abattoir.

2003. You say that you think they will be able to bring this meat in hot weather as well as in cold?—The experience of last summer proves that it could be done.

2004. Is it more expense to the shippers to preserve the meat in hot weather than in cold; have they to use much more ice?—No, I should think not; because when the temperature is once reduced the chamber is closed, and it is not opened again until the vessel arrives. The engineer ascertains the temperature by a thermometer let into the door, but the door is never opened.

2005. You say that the trade has been somewhat checked by the rise of price in America; is that rise in price supposed to be owing to the demand here or to the greater demand in America itself?—I believe it is supposed to be owing to the demand here.

2006. But notwithstanding this, so far as you are concerned, the trade is still going on?—The trade is still going on, so far as I am concerned.

2007. Your ships now arriving will have the same quantity?—I know nothing to the contrary. There is one in New York now loading, and I believe she will have meat on board.

2008. Do you know at all what the profit to the shipper was when the meat was selling here at 6¼ *d.*?—I do not know at all; but I should think that it was a very moderate profit.

2009. And you do not know what is the item that they would put aside as probable loss from damaged condition?—No, I do not.

Mr. *Whitwill.*

6 June 1877.

Mr. JOHN WILLIAM MAY, called in; and Examined.

Mr. *May.*

6 June 1877.

Chairman.

2010. YOU are the Consul General for the Netherlands, I believe?—I am.

2011. And as such you are able to tell this Committee the regulations and laws governing the cattle trade in Holland?—I am.

2012. Will you tell the Committee, shortly, what laws exist with regard to the cattle plague?—The principal foundation of our legislation in this matter is the law of the 20th of July 1870, which may be considered to correspond to the Contagious Diseases (Animals) Act of this country, in so far that it lays down principles upon which all the decrees affecting cattle, when diseases are prevalent, are founded. The law of the 20th of July 1870 contains a good many provisions.

2013. Does it govern the whole of the veterinary history of the country?—Yes; it governs the supervision of cattle, and the veterinary police of the country.

2014. Under that law, as I understand you, certain decrees have been issued at various times treating those diseases?—That is so. I may, perhaps, take them in their order of date. The first one, having reference to this matter, contains regulations respecting the burying, burning, and otherwise destroying the cattle which have been slaughtered, according to the law of the 20th of July 1870, or which have died of a contagious disease, and of other objects; and the disinfection of stables and other buildings, and of manure pits.

2015. Does that decree define what contagious diseases it applies to?—The decree defining the diseases to be considered contagious under our law is that of the 30th of October 1872, which states what cattle diseases are to be considered contagious, and indicates which of the measures mentioned in the law of the 20th of July 1870 are to be applied, on the breaking out or threatening of each of such diseases. The first article of that decree contains the schedule of diseases, and it is this: "Cattle plague in ruminating animals, lung disease in horned cattle (that is, pleuro-pneumonia), malignant foot disease in sheep, glanders and scab in horses and sheep, sheep-pox, splenitis in all cattle," and lastly, a disease which, I believe, I have correctly translated by "rabies" in all cattle. I may, perhaps, read to the Committee an abstract of Articles 13 and 14 of the law of the 20th of July: "On signs of contagious diseases appearing, the owner, or person having charge of the animal or animals, to give immediate notice to the burgomaster of the commune in which the cattle are. Affected animals to be immediately separated by the owner, and to be kept separated until the burgomaster, in consultation with the district veterinary officer, shall have decided on the measures to be taken." Those measures, of course, are guided by the decrees which may be in force at the time.

2016. Then what measures are adopted when any of these diseases break out?—The measures in case of cattle plague are contained in the Decree of the 30th of October 1872: "Cattle suffering from or suspected of cattle plague shall be slaughtered, and afterwards burnt or buried. The stable or building where cattle suffering from or suspected of cattle plague have been, shall be disinfected. The manure on the farm or place shall be disinfected. Dogs may be ordered to be detained." But I may mention that more detailed instructions are contained in the Regulations of the 4th of December 1870, where the method of disinfecting and slaughtering, burning, and burying, is gone into. "Destruction of infected articles by means of burning or burying; infected hay, straw, reeds, dry manure, wooden flooring, if in bad condition, old woodwork, strongly infected clothing, and other objects not suitable for disinfection, to be burned; or, if this should be dangerous, buried. Animals dying of, or slaughtered in consequence of, cattle plague or sheep-pox, more especially, to be burned, when the locality does not allow of burial. The things to be burned are collected together, with the upper layer of the road along which they have been brought, and are placed in a pit; and after having a sufficient quantity of pitch and petroleum poured over them are set on fire. The ash, or what may remain, is buried to the depth of a metre. In burying without burning the cattle are cut open; the hide is rendered valueless by being slashed; they are then placed in a pit with pitch, petroleum, or with a layer of quicklime, at least one decimetre thick, over it; on this are placed the manure, hay and straw to be buried, and over all a layer of earth one metre thick; the place is, if necessary, surrounded by a thick fence sufficient to keep out all cattle, and is to be kept fenced in for one year."

Chairman—continued.

2017. Those being the regulations by which you deal with the disease, do you at the same time deal at all with the stoppage of import into the country, or of transit through the country?—Yes; the Decree of the 8th of December 1870 prohibits the importation and transit from foreign countries of cattle, sheep, and goats, fresh hides, fresh and salted meat, unmelted fat, manure, unmanufactured wool, unmanufactured hair, hoofs, horns, and also all the offal of the animals abovementioned. There is a dispensatory power, as it were, given to the Minister of the Interior in this way: "Whenever any special cause shall render necessary any modification of the terms of this decree, our Minister of the Interior is authorised to make such modifications, taking all necessary precautions against the transmitting of infection, and with the co-operation of our Minister of Finance." At the present moment I believe that the prohibition extends to cattle, and the only exception that is now being made is allowing the transit of sheep from abroad.

2018. When you allow the conveyance of cattle by railway, have you any regulations for disinfecting the trucks, or otherwise guarding against the spread of the disease?—The Royal Decree of the 19th of October 1871 refers to that matter; it is this:—"The transport of cattle by railway may be effected only by means of trucks used exclusively for that purpose. Cattle trucks entering from foreign countries must be cleansed and disinfected at the frontier station, under the care of the railway company concerned, with observance of paragraphs 2 and 3 of the Instructions appended to our Decree of the 4th December 1870." That is paragraphs 2 and

Chairman—continued.

and 3 of the general instructions from which I have already quoted. "Disinfecting infected articles. The disinfection of infected articles is effected by first scraping them, and then scrubbing them with boiling water, to be followed by the process mentioned in paragraph 3. Destruction of contagious matter. The destruction of contagious matter is effected by exposing the infected articles to a current of air, or to a high temperature, or by the application of disinfectants. The district inspector decides which of these means shall be employed. The most usual disinfectants employed are chlorine, or chloride of lime, sulphuric acid, or carbolic acid. Stalls and sheds to be disinfected by means of chloride of lime, with or without whitewash," and so forth.

2019. Those regulations have been laid down for the purpose of protecting your country against the introduction of cattle plague from abroad?—They have.

2020. Was there any inspection established under that law with regard to the shipment of cattle for foreign countries?—There is a decree regulating that all cattle shipped for foreign countries shall be inspected before embarkation.

2021. With regard to the last outbreak of cattle plague in Germany, has any alteration in in your law taken place in consequence of that outbreak?—No; the existing laws were found sufficient to meet the case; they were very actively put into operation. On the occasion of that outbreak the Decree of the 28th of February 1877 was passed.

2022. There was a new instruction issued under the law of 1870 in consequence of that outbreak?—Yes, there was. The Decree of the 28th of February 1877 is this: "In those districts to be indicated by our Minister of the Interior, by an announcement in the Official Gazette, it is forbidden to remove, or to cause to be removed, any live cattle, sheep, or goats, without a permit given by the burgomaster of the commune in which the cattle are. In the permit must be stated the number and species of the animals which it is proposed to remove, the route by which they are to be forwarded to their place of destination, and also the time during which the permit is to remain valid. It must not be given by the burgomaster except in the following cases: (1.) For the removal of animals to the slaughter-house. (2.) Because of the change of residence of the owner or person in charge of the cattle. (3.) For the removal of cattle by the buyer at a public sale. If the removal extends to another commune the burgomaster who issues the permit is to send a copy of it to the burgomaster of the commune whither the removal shall extend."

2023. Does that apply to all removals?—That applies to all removals in those districts indicated, as the beginning of the article states, by the Minister of the Interior.

2024. Did you deal at all with the closing of markets on the outbreak of the cattle plague in Germany?—Yes, there is also a Decree of the 3rd of October 1873 which enables the authorities to make regulations as to the removal of cattle, and as to the prohibition of markets and public sales of cattle; but this was passed more especially, as is stated at the head of it, for the checking of the spread of lung disease.

2025. Have the markets been prohibited at all during this year in consequence of the alarm that was created by the outbreak of cattle plague in Germany?—Yes, the object of the measures taken on the outbreak of cattle plague in Germany was also to prevent the importation of cattle over our frontier, as we had no cattle plague in the country. As you are aware, we have had none since 1867.

2026. And at present the import of cattle into Holland is entirely prohibited, is it not?—It is entirely prohibited. On the late outbreak in Germany very active active measures were taken on the frontier most threatened by the outbreak at Emden, which is a short distance from our frontier, the result being that no importation of disease has taken place.

2027. But, as is the case in Germany, your frontier is protected by a military force at such times?—On this occasion a large military force of cavalry and infantry was sent to the frontier, in addition to the usual officials who have charge of these matters.

2028. With regard to the pleuro-pneumonia, what steps do you take?—With regard to pleuro-pneumonia, we have two decrees. The first is the Royal Decree of the 3rd of February 1877, containing the appointing of further regulations for the checking of lung disease among cattle, and revoking a Royal Decree of the 17th of April 1874, which is translated in the annual report of the Veterinary Department; but it only repeals it for the sake of replacing it by a very similar measure, but containing rather more tringent regulations. The Decree of the 3rd of February 1877 is as follows: "As soon as a head of cattle is attacked with lung disease, the owner, keeper, or shepherd shall cause all the cattle which may in consequence thereof become suspected, to be inoculated by a duly qualified veterinary surgeon, if the burgomaster so orders it. Before giving the order, the burgomaster must take the advice of the district veterinary surgeon." Then it defines the cost of the inoculation, which is to be paid by the State, and prescribes what is to be done if no proper virus can be obtained at the time. Then Article 2 says: "When a head of cattle, suspected of lung disease, cannot, while in the pasture, be entirely isolated, to the satisfaction of the district veterinary surgeon, the burgomaster, acting under his advice, shall order its removal to a stable or other building, with the observance of precautions to be instituted by the burgomaster, with the advice of the district veterinary surgeon, and it shall remain isolated until the expiration of the term mentioned in Article 5 of the Royal Decree of the 30th October 1872," which is, I believe, three months.

2029. Then you allow pleuro-pneumonia to be treated by inoculation?—Yes; but I wish to mention that, according to the Decree of the 30th of October 1872, the Minister of the Interior has the power of suspending the slaughtering in particular districts for a certain time and (this is the important point), can order the slaughtering of suspected animals. That is under the regulations to be applied to lung disease. In the province of Friesland, where, until lately, the lung disease was very rife, the slaughtering of suspected animals has been carried out since the 1st of January of this year. The result seems to have been (at all events, the result has been arrived at somehow) that we seem practically to have got rid of lung disease in Friesland.

2030. I understood

Mr. *May.*

6 June 1877.

Chairman—continued.

2030. I understood you to say that pleuro-pneumonia up to the time when you attempted these measures, existed to a great extent throughout your country, notwithstanding the prohibition of the import of cattle?—We have had lung disease since the prohibition of the import of cattle.

2031. And there has been a considerable amount of it throughout the country, and since January the authorities have attempted to put it down in Friesland?—The authorities have attempted to put it down by the application of measures all over the country, but those measures have not been exactly alike. As I have already stated, in Friesland we have applied the measure with regard to the slaughtering of suspected animals.

2032. Up to this time you have treated pleuro-pneumonia generally throughout the country, by inoculation, but, subsequently to a certain date, the Minister has exercised the powers entrusted to him by the Decree of the 30th of October 1872, and has ordered the slaughter of animals suspected of pleuro-pneumonia in the district of Friesland?—And in other places; part of South Holland.

2033. What have been the results of that decree?—The result for the whole country has been, from 1871 to 1876, as follows: in 1871 there were 6,078 cases of pleuro-pneumonia in the whole country; in 1872 there were 4,009 cases; in 1873 there were 2,479 cases; in 1874 there were 2,414 cases; in 1875 there were 2,227 cases; and in 1876 there were 1,723 cases.

2034. So that you have reduced it in those five years from 6,078 cases to 1,723?—That is so.

2035. And that is to be attributed in some measure to the slaughtering of suspected animals having been adopted?—That is so. I may mention that according to my statistics on that point, in the four weeks ending the 19th of May (our returns of lung disease are made up every four weeks), 100 cases occurred in the whole country, the largest number being in the province of South Holland. The return of lung disease for four weeks, from the 22nd of April to the 19th of May of this year, is as follows:—In Guelderland, four cases; in South Holland, 87 cases; and in Friesland, nine cases; making a total of 100. The head of the veterinary department at the Hague informs me that at the present moment he considers that there are really no infected herds in Friesland; the number of cases for four weeks was reduced to nine head between the 22nd of April and the 19th of May.

2036. The measures now adopted give hope, therefore, of your being able to stamp out pleuro-pneumonia?—Certainly very strong hopes are entertained of that.

2037. You have not had, as I understand, cattle plague in your country since 1867?—We have not.

2038. Have you any law enabling you to slaughter animals which have been in contact with beasts infected with cattle plague?—According to the Decree of the 30th of October 1872, defining the methods to be adopted in dealing with the different diseases, it is stated, in Article 3, Section 1: "Cattle suffering from or suspected of cattle plague shall be slaughtered, and afterwards burned or buried."

2039. Have you any regulation, such as that which was recommended by the Committee of

Chairman—continued.

1873, that power should be given to the authorities to slaughter animals not only that were in contact with infected animals, but that were within a certain radius of an infected spot; similar, in fact, to the powers which they exercise in Germany and in Denmark?—That depends upon the meaning to be given to the word "suspected" in this section, because suspected cattle are to be slaughtered. It does not define what is suspected.

2040. You think that that would enable the authorities to take all the cattle in a given radius and slaughter them as suspected of possibly having got the infection?—I believe that would be the result of carrying out of this regulation. It also provides for the disinfecting of buildings, and so on.

2041. How is the slaughter dealt with as regards compensation; does the compensation, first with regard to cattle plague, fall upon the locality or upon the Imperial funds? First with regard to the cattle plague?—The compensation is paid from the Imperial treasury. That is to say, amounts are voted by the States General for this purpose.

2042. What proportion of the value of the animals is given as compensation?—In the case of suspected animals the full value is given, and in the case of diseased animals half the value is given. Detailed regulations are laid down for the purpose of getting at the valuation, and, in case of difference of opinion as to the value, that is provided for by the decree.

2043. Can you give the amount of compensation that has been paid?—For lung disease from the 1st of January of this year to the 15th of May we have spent as compensation for cattle slaughtered on account of having lung disease, 51,244 guilders; that is rather more than 4,200 *l.*; but we have spent 365,722 guilders, or about 30,400 *l.*, for suspected cattle; and altogether we have spent 34,747 *l.* sterling.

2044. That, I understand you to say, has been since this new attempt has been made by slaughtering to stamp out pleuro-pneumonia?—This is since the 1st of January of this year. There was slaughtering of suspected animals before that. I was speaking of the Province of Friesland.

2045. With regard to Friesland, the attempt to stamp out coincides with this large amount of compensation?—Yes.

2046. Can you give the proportion of cattle in Friesland as compared with the rest of the country?—Yes, the returns that I have are made up to the year 1875. In Friesland, there are 212,774 cattle; 120,873 sheep; 1,950 goats; 23,202 horses; and 11,525 swine.

2047. Would you compare that with the total amount in the whole country?—The total amount of cattle in the whole country is 1,456,681, of which 212,774 are in Friesland; there are 941,067 sheep, of which 120,873 are in Friesland; there are 153,082 goats in the whole country, of which 1,950 are in Friesland; and there are 338,646 swine in the whole country, of which 11,525 are in Friesland.

2048. Then the important matter is, that with that proportion of stock in Friesland, you believe that this disease has been, or is on the point of being, stamped out by the measures which have recently been adopted?—I believe that it may practically be said that it is stamped out in Friesland.

2049. Are

Chairman—continued.

2049. Are you able to speak at all as to the opinion in your country with regard to the contagious nature of the lung disease, and whether it is conveyed by mediate contagion?—The opinion entertained by the veterinarians in my country differ sometimes from that which is entertained here on this point. We think that lung disease may be propagated by mediate contagion. If I read aright the report of the Veterinary Department, that is not the opinion entertained in this country, or at all events not to the same extent.

2050. Then you look upon the disease as more infectious than it is generally supposed to be in this country?—We look upon it as being more infectious by mediate contagion.

2051. Have you considered at all the question of how your trade is affected by the establishment of the cattle market at Deptford?—Yes. In so far as what I hear from those interested in the matter goes, it appears that the cattle market at Deptford is not considered so good a market for the seller as the cattle market at Islington.

2052. The objection which they have, I suppose, is that there is a more limited trade at Deptford than at Islington?—The objection which they seem to have is this: that they get so few buyers comparatively at Deptford to what they get at Islington. I am told that the number of persons attending the market at Islington on the market-day may be put down at something like 3,000 people, and that the buyers at Deptford are something like 50 in number.

2053. At the same time the risk of the introduction of pleuro-pneumonia as long as it continues to its present extent in the Netherlands, would justify the exclusion of them from the home market, would it not?—I am not prepared to say that.

2054. You admit that the disease is still so prevalent in your country as to require very great efforts on your part to stamp it out?—Yes; but then there is the inspection on the embarkation of the animals, which is a safeguard.

2055. What is the form of inspection at the ports of embarkation?—The animals are inspected by duly qualified veterinary surgeons.

2056. Are the animals detained any time for the purpose of inspection before being shipped?—I do not know that I am acquainted with the details of the carrying out of that measure.

2057. You are aware of the time that pleuro-pneumonia remains in incubation before it develops itself?—I am aware that pleuro-pneumonia is considered to be a disease of long period incubation.

2058. And therefore the inspection at the port of embarkation is not an absolute safeguard against the breaking out of the disease, is it?—No; it is not an absolute safeguard.

2059. Have you had your attention directed to the question of the dead-meat trade?—Only incidentally.

2060. I mean with regard to the feeling of the people in the Netherlands?—There seems to be an impression that it would be extremely difficult to establish a dead-meat trade with the Netherlands on account of the extra expense to which the senders of cattle would be put.

2061. Did you hear the last witness give his evidence?—I heard a good deal of what he said.

2062. He described the way in which the meat was imported from America, and of course the length of the voyage; and therefore the time required would be very much less from the Netherlands?—Yes, certainly.

2063. You think that the expense would be an obstacle to such a system being introduced?—I think it would.

2064. Is that in consequence of the prices of the animals being higher in the Netherlands than they are in America?—Partly so. There is a return lately made giving the price of meat.

2065. You think that any addition to the cost of its transit here would throw the supply into other markets?—Yes; our dealers seem to think that it would induce them to try other markets in preference to this. In fact, any restriction put upon the trade has that tendency to a certain extent.

2066. Would it tend at all to diminish the raising of stock in the Netherlands if the import of live stock from that country were entirely prohibited?—Certainly, I think so.

2067. It would alter the conditions of farming in your country?—I think it might very likely have that effect.

2068. We have heard from Professor Müller that fresh arrangements have been made with regard to telegraphic communication as between the Governments on any outbreak of disease; are there any arrangements made in your country on that head?—Certainly. An arrangement, which I was instrumental in getting carried out was, that immediately on the outbreak of cattle plague in either country, telegraphic communication should be made direct from the Veterinary Department of the Minister of the Interior in the Netherlands to the Privy Council Office in London.

2069. That is a similar arrangement to that which was established with regard to Germany?—That may be so; I do not know.

2070. But we understood from Professor Müller that since this last outbreak it was proposed to alter that arrangement, by enabling the veterinary inspector at the place where the outbreak occurred, to communicate directly with the Privy Council Office in London, instead of sending the communication round through the office of the Minister, saving by that, of course, an interval of time; that has not been contemplated in your country?—Not that I know of. Telegraphic communication even from the remotest inspector to the Hague, would be only a question of a few minutes.

2071. Would all your ministerial offices be open and at work on Sundays, for instance?—Telegraphic communication can be carried on on Sunday in the Netherlands.

2072. It is stated as the reason why the telegraphic notice of the late outbreak did not arrive in this country that it was telegraphed first of all to the Minister who had to notify it here, and that it arrived on the Sunday, and it was not opened till the Monday, and hence the delay?—I am not prepared to say how far such details would be an obstacle to the rapid communication.

2073. I suppose that you are in a position to say that any such alteration in the arrangement, in order to facilitate the intelligence, would be capable of being made?—Certainly; any such alteration would be most readily made.

2074. You would represent to the Committee that the cattle plague has not existed since 1867 in

Mr. *May*.

6 June 1877.

Chairman—continued.

in the Netherlands; that the regulations which you have adopted are so strict as to justify you in believing that you will not have a recurrence of that disease there; and that, as regards pleuro-pneumonia, you are taking maasures which point to the eradication of that disease in your country?—Certainly.

2075. Have you any measure specially applying to foot-and-mouth disease?—Foot-and-mouth disease is not in our schedules; but, in the reports which I have from the Veteriniary Department of the Hague, I see that certain recommendations on the subject have been made, and appear to have been carried out.

2076. Is there any inspection at the port of embarkation with a view to detecting that disease?—Yes, there is an inspection at the port of embarkation for foot-and-mouth disease, certainly for all animals coming to this country, and there has been a good deal of correspondence upon that very subject, the Dutch inspectors thinking that the English inspectors are rather too severe, inasmuch as they seem to have taken for foot disease mere abrasures, and so on, of the foot.

2077. From the fact that you have not scheduled it as one of those contagious diseases, it would appear that you do not look upon foot-and-mouth disease with the same alarm as we do in this country?—We do not.

2078. Is there anything else which you would like to lay before the Committee?—With regard to foot-and-mouth disease, certain recommendations have been made by the burgomasters generally that animals affected with that disease should not go along the public ways, and that they should be kept away from healthy animals, which regulations have been generally carried out where foot-and-mouth disease has been rife. They are not embodied in any decree, because that cannot be done on account of the disease not being in a schedule. It is only a recommendation, but according to this report, it seems to have been fairly carried out.

2079. But in law there is nothing to prevent the spread of foot-and-mouth disease in the country?—No, it is not in our schedule of contagious diseases.

Colonel *Kingscote*.

2080. You have stated the gross sum of the compensation which you have paid for animals slaughtered for pleuro-pneumonia; can you state how much a head it is that you allow for a cow or a calf?—No; I can say that we allow the full value for suspected animals slaughtered.

2081. Is it fancy value or butcher's value?—There are regulations as to arriving at the value. Where the owner is not satisfied with the valuation he can call in other authorities to value.

2082. Is it settled by Government officials?—By judicial authority.

2083. And the owner has the right of disputing the first valuation?—Yes; the owner has the right of disputing the first valuation and of calling in other authorities.

2084. He can refer the matter?—He can have it referred, and then the true value is arrived at; and if he is still not satisfied, the amount is paid in to the proper authority.

2085. There is no established basis that it should be butcher's value only?—I do not see that stated.

2086. I think I understood you to say that

Colonel *Kingscote*—continued.

since you have given up inoculation in the country pleuro-pneumonia has decreased?—We have not given up inoculation; the regulations as to inoculation are in force for lung disease.

2087. Is inoculation carried out?—Yes; the Decree of the 3rd of February 1877 is this: "As soon as a head of cattle is attacked with lung disease, the owner, keeper, or shepherd shall cause all the cattle which may in consequence thereof become suspected to be inoculated by a duly qualified veterinary surgeon if the burgomaster so orders it." Then the burgomaster takes the advice of the veterinary authority, and the cost of inoculation is borne by the State, and a certain sum is allowed for each head of cattle inoculated. Provision is made that "If no proper virus can be obtained, in the opinion of the district veterinary surgeon, the burgomaster may give his consent to the postponement of the inoculation until such virus can be procured. The district veterinary surgeon shall supply the veterinary surgeon charged with the inoculation as early as possible with good virus."

2088. Then the authorities in your country consider that inoculation is a preventive of pleuro-pneumonia?—Yes.

2089. And they carry it out by law?—They carry it out by law. It seems to be the opinion in my country that in the case of an animal having disease by inoculation, the course of the disease is accelerated, and also that it is a protection to the animal from further contagion of the disease. Of course in all places where the slaughtering of suspected animals is carried out for lung disease, inoculation does not take place. If in any place it is decreed that the animals suspected of lung disease should be slaughtered, then there is no opportunity for inoculation, but they are all slaughtered; so that there are two systems in the country.

2090. Who has the power of putting one or either of those regulations into operation?—The Minister of the Interior.

2091. But supposing that you have a herd of cattle, and that pleuro-pneumonia breaks out in that herd, what have you to do?—I have to report it at once to the burgomaster of the district.

2092. Who decides whether your cattle shall be slaughtered or whether you shall inoculate?—If I am in a district in which it is already ordered that slaughtering of suspected animals shall take place, my animals are all slaughtered. If I am in a district in which the decree as to inoculation only is in force, then they are taken to the stable, if it is thought necessary by the veterinary authorities, and kept there and inoculated.

2093. And you have different orders for different districts?—Yes.

2094. Is your country divided into districts?—As I have already stated, in the province of Friesland, since the 1st of January this year, animals suspected of having lung disease have been slaughtered; and that is the case at the present moment also in a part of the province of South Holland where the disease is most rife.

2095. As regards foot-and-mouth disease, I think I understood you to say that you have no regulations against it?—No, it is not in our schedule.

2096. Therefore, animals at the port of embarkation, for this country or any other country, say at

Colonel *Kingscote*—continued.

at the Hague, might be walking about with foot-and-mouth disease and no notice would be taken of them?—Notice would be taken of them, because as I have said, a general regulation is made that they shall not pass along the public highways, and shall not be brought into contact with healthy animals; but this is not a law.

2097. Are there inspectors along the quays of your ports to prevent animals with foot-and-mouth disease from being exported to London or anywhere else?—Yes, they inspect all animals sent to this country before leaving the country immediately before embarkation; and animals with foot-and-mouth disease would be rejected.

2098. But this is only done to protect yourselves against the loss which would occur if a shipload came over here with foot-and-mouth disease and was condemned; you do not do it to keep your own country free of foot-and-mouth disease?—No, it was to satisfy the requirements and regulations on this side.

Mr. *Anderson*.

2099. Do I correctly understand you to mean that the opinion of your country generally is, that inoculation does not merely make the disease more mild in the first taking, but is also a subsequent preventive?—That is the idea.

2100. So that an animal that once has pleuro-pneumonia does not take it again?—That seems to be the idea.

2101. Is that an experience which is founded on a long course of years?—I cannot tell you the fact, but the idea is that it acts as a preventive.

2102. You speak of pleuro-pneumonia and lung disease as convertible terms, do you not?—Yes.

2103. And you distinctly consider that pleuro-pneumonia is an imported disease and can be stamped out by regulations?—Yes, it can be stamped out.

2104. Is it not a disease very similar to consumption in the human subject?—I am not prepared to say how similar the two diseases may be.

2105. If the two diseases are similar, and lung disease can be stamped out, one would have thought that possibly consumption could be got rid of by the same process of stamping out?—It would require more medical knowledge than I possess to give an opinion upon that point.

2106. You think that foot-and-mouth disease is less contagious than pleuro-pneumonia?—I am not prepared to say that; we consider it a less dangerous disease.

2107. It is merely that you consider that it does not do so much damage as pleuro-pneumonia?—Yes. I do not know the opinion of the Dutch veterinarians upon the comparative contagiousness, if I may so say, of the two diseases, but they seem to consider, at all events, that the foot-and-mouth disease (and I believe it is the fact) is a much less dangerous disease, inasmuch as it is less fatal.

2108. You are aware that here we consider it highly contagious?—It is highly contagious, no doubt.

Mr. *French*.

2109. I understood you to say just now, that in all movement of cattle it is necessary to obtain a permit?—According to the Royal Decree of

Mr. *French*—continued.

the 3rd of October 1873, "It is forbidden to remove horned cattle out of or into those communes or parts of communes, which may be specified by our Minister of the Interior. This announcement is to be made generally known by publication in the official gazette." That only applies to certain districts in which it is thought advisable to bring the decree into force.

2110. Then would that permit be given to cattle suffering from foot-and-mouth disease alone? I am not prepared to say that; I do not know.

2111. Are there penalties attached to the breaking of the recommendations of the burgomaster, with regard to foot-and-mouth disease?—No; so far as I know, there are not; I do not see how there can be, if it is not in the schedule of diseases.

2112. Do you know what the penalties are that are attached to neglecting to give notice of lung distemper?—Yes; the imposition of a fine.

Mr. *Norwood*.

2113. I think you gave a general opinion that the prohibition of the import of live cattle from Holland to this country would have the effect of discouraging the breeding of cattle on your side, and, of course, of decreasing the supply to this side?—I think so.

2114. Have you gone into the question in detail?—I have not.

2115. You have not closely considered the question of the conveyance of meat in those ice safes?—I have not.

Mr. *Chamberlain*.

2116. Under what circumstances do you enforce the restrictions on the movement of cattle: is it in the case of an outbreak of cattle plague, or is it in case of an outbreak of the other diseases named?—It will be competent for the Minister to order the stoppage of markets, and so on, on the outbreak of any disease, if he thinks it advisable.

Chairman.

2117. That is to say, any disease that is in the schedule?—Yes, I am speaking of diseases in the schedule.

Mr. *Chamberlain*.

2118. Do you know whether it is done in the case of either pleuro-pneumonia or foot-and-mouth disease?—Foot-and-mouth disease is not in the schedule.

2119. In the case of pleuro-pneumonia is it done?—In an outbreak of pleuro-pneumonia it would be done.

2120. In the case of a district in which the general movement of cattle was restricted, would the movement of healthy cattle be permitted?—No, the whole movement of cattle in the commune would be stopped. The Decree says, "It is forbidden to remove horned cattle out of or into those communes, or parts of communes, which may be specified by our Minister of the Interior. This announcement is to be made generally known by publication in the official gazette." In special cases the burgomaster can grant permission for such removal, after taking the opinion of the district veterinary surgeon, and on the conditions which may be considered necessary by him."

2121. I think

Mr. *May.*

6 June 1877.

Mr. *Murphy.*

2121. I think you said that experiments have been made by way of inoculation for the purpose of eradicating, or of mitigating, the evil of pleuro-penumonia; how many years is it since those experiments were first instituted?—The Royal Decree which, so far as I know, was the first which prescribed inoculation, was the Decree of the 17th of April 1874, but that has been replaced by another one.

2122. I understand that the 17th of April 1874 was the first time that the experiment was ordered to be tried?—So far as I know, it was.

2123. Are you prepared to say what the effect of that has been, generally speaking?—That is shown in the gradual decrease of the disease.

2124. The effect of it has been to diminish the disease?—Yes.

Mr. *M'Lagan.*

2125. Is not pleuro-pneumonia indigenous to Holland; has it never arisen there without importation?—I am not prepared to say.

2126. Then, supposing that you stamp it out in any particular district, you could not say that you would not have the disease again without its being imported from any other country?—I am not prepared to answer that question.

2127. Do you know anything about the history of pleuro-pneumonia in Holland?—No, only by the regulations which have been made; I have only addressed myself to the regulations which have been made upon the subject.

Mr. *Elliot.*

2128. You said that, if the importation of live animals into England from the Netherlands were prohibited, the Dutch cattle would very likely be sent to other markets; can you say whether such a quantity as we take would be likely to be sent to other markets?—France is a great market with us; we send a great many cattle to France. I have a return here for 1875; I have nothing later than that made up; from that return I find that there was an exportation to Belgium of about 58,000 head of cattle; of course all our exportation to France would appear upon our returns as exportation to Belgium, as it all goes through Belgium. I am told that a great proportion of those were milch cows, but I am not prepared to say what. Then we have an exportation to Prussia of nearly 19,000, and all that would be capable of increase if the English market were made too difficult.

2129. Do you know whether it costs more to send cattle to France and Prussia or to England?—I have not the prices of transit by railway to France, but I should presume that the transit by railway would be dearer than the transit by steamboat to England.

2130. Therefore, if you had to send dead meat instead of live animals, that would become a part of the cost if not the whole of it?—Part of it; I do not know the amount that is paid for transport by railway into France, and unless I had that I could not compare the two.

Mr. *Torr.*

2131. Do you import breeding bulls from this country into your country for the improvement of your stock?—I believe that now and then a certain number goes from this country into Holland, but I have no return of the numbers.

Mr. *W. E. Forster.*

2132. How long has Holland been put into the list of countries from which cattle have to be slaughtered at Deptford or at the port of landing?—Only lately; until the outbreak of cattle plague in Germany in January, which seemed to have alarmed the authorities in this country, our cattle were allowed to come to the Islington Market.

2133. You have been scheduled since January?—Yes, subsequently to the outbreak at Emden.

2134. Has that diminished the number of cattle imported from Holland?—I have no return of the number of cattle during this year.

2135. It has not been brought before you that it has made much difference, has it?—It has been mentioned incidentally that the number of cattle has been less since that time, but I have no statement of the figures.

2136. The import of store cattle stopped altogether, I suppose?—Yes, I presume so.

2137. Were there many store cattle imported last year?—Of that I have no return separate from the rest of the cattle.

2138. I understand you to say that, as regards pleuro-pneumonia, you consider that the measures which you are now taking will really clear Holland of the disease?—We hope to do so by the application of the measures that can now be taken according to the decrees which are at present in force.

2139. As regards foot-and-mouth disease, though you have no regulations to stop it in Holland, you do not allow any animal to be exported that appears to have foot-and-mouth disease?—They are rejected by the inspectors.

2140. You are aware, I suppose, that, although pleuro-pneumonia is a disease which is a long time in process of incubation, foot-and-mouth disease is not?—It is not a long time in process of incubation.

2141. And, therefore, animals affected with foot-and-mouth disease would very likely be discovered by the inspector?—That is our opinion, certainly.

2142. Have you ever made any attempt to stop foot-and-mouth disease by legal measures?—No, it appears not.

2143. I suppose your reason has been that you thought you could not do it without stamping it out, and that the disease was not sufficiently dangerous for the public to put up with the stamping out?—That was our idea.

2144. I understand you to say that you do not import cattle into Holland from any continental state?—We do not.

2145. And therefore there is no fear that the Russian cattle, or the Steppe cattle, could make use of a Dutch port for the purpose of getting to this country?—No, we do not allow any importation of cattle.

Chairman.

2146. Have you ever had any cases of smuggling over the frontier, as is stated to have taken place in Germany?—I have heard of no special complaints upon that head; it is impossible to say that such a thing has never taken place.

2147. Supposing that cattle plague breaks out in Germany, there is the same risk in the Netherlands as in Germany from the Russian cattle, is there not?—No, I think not.

2148. But

Chairman—continued.

2148. But you admit that the smuggling is possible?—It is possible; but I have heard of no complaints upon that point, and our idea is that our frontier is so watched that it is next to impossible.

2149. You think that the precautions which are taken are sufficiently stringent to prevent any smuggling of diseased cattle from Germany across your frontier?—Exactly so.

Mr. *W. E. Forster.*

2150. The Dutch frontier is a very much shorter one than the German frontier?—Yes, and more easily managed.

Mr. *W. E. Forster*—continued.

2151. And there is this difference, is there not, that whilst the cattle plague has almost always existed on the Russian side of the German frontier, it rarely exists on the German side of the Dutch frontier?—Yes; so that, as in the case of the outbreak at Emden, we can direct all our efforts to the threatened point.

2152. Is it not the case that you absolutely prohibit the import of cattle from Germany and from the other continental states into Holland mainly in order to secure your export to England?—That was the great motive, I believe, besides protecting ourselves; we considered it necessary for our own protection.

M. G. A. Thomsen, called in; and Examined through an Interpreter.

Chairman.

2153. You belong to Schleswig-Holstein, I believe?—Yes.

2154. Are you a practical farmer and grazier in Schleswig-Holstein?—That is my occupation.

2155. Are you well acquainted with the country?—Yes, and in particular with the west coast.

2156. Can you tell the Committee what the principal industry of Schleswig-Holstein is?—In the first line we produce cattle, dairy produce, and corn.

2157. Can you state what number of cattle Schleswig-Holstein exports in the year?—From Tonning were exported 50,000, and from Schleswig-Holstein in all 70,000 head of cattle.

2158. Do the other cattle that do not come from Tonning come from Altona, or from what port do they come?—They are exported to England only from Tonning and Gluckstadt; the remainder goes to Hamburg Market.

2159. Are those cattle that are imported into this country all reared in Schleswig-Holstein?—They are not all reared there, but most of them are. A great number of them are imported from Jutland in Denmark to the north of Schleswig.

2160. Are you aware of there being any duty on the cattle on their coming from Jutland into Schleswig?—The importation of cattle from Schleswig to Jutland is prohibited, but there is a free importation from Jutland into Schleswig.

2161. There are no restrictions on the cattle coming into Schleswig, although Denmark prohibits the cattle going back into Denmark?—That is so.

2162. Has the export of cattle to London at all changed the production of cattle in Schleswig?—Decidedly.

2163. What would be the consequences to Schleswig-Holstein if the export of live cattle to England should be suddenly stopped?—I am not able to say what consequences it might have if the live cattle could not be brought from Schleswig-Holstein, but they would be very serious and injurious to our trade.

2164. I suppose it would affect one of your largest markets for their production?—Yes, decidedly. To bring dead meat here from Schleswig-Holstein, I think, is an impossibility.

2165. Has any dead meat been exported from that country?—Very little.

Chairman—continued.

2166. Can you tell us what is the price of meat in Schleswig-Holstein at the present time?—About 6 *d.* to 7 *d.* per lb.

M. *Thomsen.*

2167. That would allow a large margin for the expenses of exporting the dead meat, because the market price of England is very much higher than that?—I do not think it is at all practicable to bring dead meat from Schleswig to this country.

2168. What are the reasons why you do not think it practicable?—In the first place the exporting is done by about 2,500 different shippers. I think that it is an impossibility that this number of shippers could combine and make a profitable business of sending their small loads as dead meat to England.

2169. Do you think that it would be possible, by establishing a company, to get over that difficulty?—That might be possible, but it is not in my line to answer that question.

2170. Would it affect this trade if the cattle which are at present imported, say from an unscheduled country, had to be imported to Deptford to be slaughtered at the port of debarkation?—I think that the production would lessen.

2171. At present they are scheduled, and are obliged to be slaughtered at Deptford under the last Order, are they not?—They do not export at present; our export begins with the beginning of July, and lasts until November.

2172. This is the period in which no export takes place from Schleswig?—Yes.

2173 And it is your opinion that, if that Order continues after the time when the export trade begins, it would seriously affect that trade?—It would influence our market very seriously; and, in case the cattle have to be killed at Deptford, they will be obliged to take them to Hamburg, Lubeck, Berlin, and other German places.

2174. And, in fact, you think that it will set up a new trade in your country, and that the present trade with England will be diverted to those places?—Yes, and it would be necessary for us to introduce other means of making our farms profitable.

2175. Have you had the rinderpest in Schleswig-Holstein?—With the exception of one case, which occurred this year in the immediate neighbourhood of Hamburg, it is my opinion that the cattle plague has not been there in this century.

2176. Does that opinion of yours refer to Schleswig and Holstein combined, or to Schles-

M. *Thomsen.* 6 June 1877.

Chairman—continued.

wig alone?—To Schleswig and Holstein combined.

2177. Altona is in Schleswig-Holstein, is it not?—Altona belongs to Schleswig-Holstein, but in reality it is divided from Schleswig-Holstein, being a free territory in the same way as Hamburg, and it is surrounded by a line of custom house officers.

2178. But the export trade from Schleswig-Holstein comes partly, as I understood you to say, in answer to a previous question, from Altona and Hamburg?—It goes to Altona and Hamburg, but it does not go to this country through those places.

2179. Are you aware that the last outbreak of cattle plague came from Altona to this country?—I know it from the papers.

2180. And that therefore the cattle from Schleswig coming through Altona as a port, are, as far as their transit through and their station while they are being embarked are concerned, liable to the infection that may be imported into Hamburg and Altona?—They are not shipped from Schleswig-Holstein by the graziers to England in that way. The graziers and farmers will send them to Hamburg and bring them to the market there; and if they come at all to England from Hamburg, they are sent by senders from Hamburg, and not by senders from Schleswig-Holstein.

2181. Then do the Schleswig-Holstein farmers use only the port of Tonning?—Yes, only Tonning, and Gluckstadt since last year.

2182. Both those being ports of Schleswig?—They are ports of Schleswig-Holstein.

2183. I understand you to say that you are anxious, on account of your country, to preserve freedom of trade as between Schleswig-Holstein and the markets here; that being so, if regulations were made prohibiting the import of cattle from Altona and Hamburg, would that trade be possible as through Tonning and Gluckstadt?—I do not exactly understand the question; but if they had a free market to England they would not feel the restriction.

2184. It might be possible that in consequence of Altona and Hamburg being ports from which cattle plague has come to this country, they might be closed as regards import into this country; I understand you to say that your object is to maintain the trade free, because Schleswig-Holstein has never had the cattle plague; if we prohibited Hamburg and Altona, would the trade take the direction of coming to this country through a port like Tonning, which is in Schleswig-Holstein, and is therefore free from cattle plague, though Altona is not; is it necessary that Altona should be your port of export?—The principal export is from Tonning; the quantity being 49,000 last year, and from Gluckstadt 2,000.

2185. And 20,000 came through Hamburg and Altona?—They are taken to the Hamburg market; most of them will be eaten in Germany; they go to German towns.

2186. Have you had pleuro-pneumonia in Schleswig-Holstein?—In 1874 we had one case where they had an outbreak in one farm; but by the precautions which were taken by our Government it did not spread beyond that farm.

2187. Are you in a position to state what are the internal regulations in Schleswig-Holstein

Chairman—continued.

for dealing with these diseases?—Every farmer is obliged to give notice of a case of disease to the nearest (Landrath) counsellor of administration; and then, according to the nature of the diseases, if it is pleuro-pneumonia, it is made a rule that the place is closed at once against all neighbouring places.

2188. Is there any slaughter of cattle in infected districts in case of pleuro-pneumonia?—Not in all. It is difficult to give a decided answer on this matter, as pleuro-pneumonia can be treated by the Government according to the merits of each individual case. They take the merits of the case in which the disease appears.

2189. And they have had only one instance of an outbreak of pleuro-pneumonia in the time you state?—Yes.

2190. And that was stamped out at once?—It was stamped out at once. It was on one farm, but it was more than one head of cattle that was attacked.

2191. Is compensation paid for cattle slaughtered by the Government?—I think that they get compensation up to three-fourths of the value.

2192. Have you in Schleswig-Holstein any laws restricting the import of cattle into Schleswig-Holstein to account for pleuro-pneumonia not haveing been introduced there?—No, we have no other restrictions than those generally in use in Germany.

2193. And if pleuro-pneumonia existed in Germany, there is nothing to prevent its spreading into Schleswig-Holstein?—There is no restriction on importing cattle from Germany, but the import is to such a small extent that it does not practically make much difference.

2194. Practically, the import of cattle into Schleswig-Holstein is principally from Denmark, where the protections against these diseases are very strong?—It is so.

2195. Have you had foot-and-mouth disease among your herds in Schleswig-Holstein?—We have seldom had it; we had it some years ago, about 1872 or 1873; but the Government interfered at once in such a manner, that the disease was stamped out directly.

2196. Before it was stamped out did it spread to any extent; was it in many farms?—It spread to several farms, but it is difficult to say how many,

2197. Still it was in more than one place?—It was in more than one place.

2198. And it was stamped out by the measures that were taken by the Government?—Yes, it was stamped out by those regulations.

2199. Are you aware what those measures were?—I cannot say beyond this; that the places were closed against the neighbourhood.

2200. That they were made infected places, and that no communication was allowed?—No communication was allowed.

2201. Has sheep-pox ever existed in Schleswig-Holstein?—In my neighbourhood there has been none, but I cannot answer for the rest of the country; I do not think that there has been any.

2202. Speaking generally for Schleswig-Holstein, they have been almost entirely free from these contagious diseases for many years, and have stamped them out at once where they have arisen?—Yes.

Mr. *W. E. Forster.*

2203. May I ask whether your farm is situated in Schleswig or in Holstein?—It is in Holstein, about an English mile from Tonning, on the border of Schleswig.

2204. Your own cattle you send to Tonning?—I always send the cattle only to Tonning.

2205. Do many cattle come from the Port of Husum?—Husum is the principal cattle market in Schleswig; the markets are held there about a fortnight or three weeks before the export begins from the principalities, and the meat from there is consumed to a great extent in the country; the butchers of the country come there and buy their cattle there, but it is not a place of export. All the cattle from there are sent *viâ* Tonning to London.

2206. You are aware that for several years cattle from Schleswig-Holstein have been allowed to be brought to England without being slaughtered at the port of debarkation?—Yes, I know that, because I am a shipper myself.

2207. But the declaration that the shipper had to make only applied to cattle from a port in Schleswig or Holstein, and it did not apply to Schleswig-Holstein cattle that were sent by Hamburg, did it?—It only related to cattle sent from Tonning.

2208. And therefore any danger of cattle being infected in Hamburg would not apply to your cattle that were sent to England?—No.

2209. Will you be kind enough to tell the Committee whether the chief object of your giving us the advantage of your evidence is to prevent our passing a law that no live cattle are to be exported from Schleswig-Holstein to England, or that the cattle that are exported from Schleswig-Holstein should not be obliged to be killed at Deptford or at the port of landing?—I think it impracticable to send dead meat from Schleswig-Holstein.

2210. But I understood you to say that unless you had free importation you would be obliged to stop the trade, so far as England is concerned; does that remark apply to your not being allowed to send the cattle to be slaughtered anywhere in England, or does it apply to your not being allowed to send live meat?—The question is whether we get the free trade into England. That means getting our cattle to Islington instead of to Deptford. We shall not be in a position to trade with England at all, if we have not free trade with England; which means that we can bring our cattle to the English market at Islington and not to Deptford.

2211. Am I to understand that you do not think you can send cattle to England if the cattle have to be slaughtered at Deptford?—We shall not be able to compete with other countries if we have to bring our cattle to Deptford where it has to be killed; and if other foreign countries, like Denmark, where we have to get our lean cattle from, can bring their cattle to Islington.

2212. Were you an exporter at the time that cattle had to be slaughtered at Deptford?—Yes; I have exported to Deptford, and I have felt the consequences.

2213. We should be very glad to know what you would consider to be the loss upon a beast by sending it to Deptford rather than sending it to the Islington Market?—I estimate the loss at from 1 *l.* 15 *s.* to 2 *l.* a head on cattle, and 5 *s.* on sheep.

2214. Have you read the report of the Veterinary Department of the English Privy Council Office for the last year?—I have not.

2215. I see it is stated in that report that no case of foot-and-mouth disease has been detected during the year among cattle landed from Tonning, and that there is no reason to suspect that the disease exists in the Duchies of Schleswig and Holstein; that statement confirms what you believe to be the fact?—Yes.

2216. How are the cattle shipped at Tonning?—Every Wednesday and sometimes on Thursday four or five steamers are loaded at Tonning. The ships run a distance of about 400 miles from there to London in about 30 or 40 hours, and they had very few losses in the last year, only some head. The cattle are inspected by veterinary inspectors on shipment, and a head inspector is appointed by the Government to watch the shipment. All the cattle sent from the pastures are driven by road direct to Tonning, and a certificate has to be procured from the officials of the different communes, indorsed by the English Consul, that the cattle had been grazed for four weeks in the provinces.

2217. What proportion of the cattle that are exported from Tonning come from Denmark?—About 25,000 or 30,000 bullocks are imported from Denmark for fattening purposes in Schleswig-Holstein.

Mr. *M'Lagan.*

2218. What did the farmers of Schleswig Holstein do with their stock before the recent importation of cattle into this country?—Thirty years ago, when we were not allowed to bring our cattle to England, we were masters of the market in Hamburg and Lubeck; and the production of cattle has been increased since the decree of Sir Robert Peel in 1843 (I am not certain as to the year) to the extent of about 200 per cent. Since the year 1868 the increase in the number exported from Tonning has been about 13,000 head. The farmers have been induced to lay out their land into pastures or meadows, and there is still a prospect of increasing the quantity of cattle for export.

2219. Did you sell your cattle 20 years ago, or did you make dairy produce, and export it?—The working of the farms has been changed since that time. Some of the highlands have been more cultivated, and a lot of country which would have been used in former years for the growing of corn, has been turned into meadows and pastures.

2220. And the meadows and pastures are used for rearing cattle, or for feeding cattle, or for dairy purposes?—There are different circles, but I speak principally of the circle of Eiderstedt, which is entirely used for fattening bullocks.

2221. And the rest of the country is used for rearing stock, or for dairy purposes?—Yes, the rest of the country is used for rearing and dairy purposes, and for growing corn.

2222. Then, supposing that the importation of live stock into this country from Schleswig-Holstein were prohibited, could not a Schleswig-Holstein farmer resort to dairy production as a source of profit?—He would be obliged to fall back upon dairy farming and growing corn.

2223. Would he not find that as profitable as sending fat cattle to England?—I do not think so, because the corn is brought very cheaply from foreign countries.

M. *Thomsen.*

6 June 1877.

Mr. *M'Lagan*—continued.

2224. Do you know what has been the difference in the price of dairy produce, say of butter and cheese, for the last 20 years?—I do not recollect exactly. I think about 20 years ago butter cost about 9 silbergroschen, which is not quite 1 *s.*, and now we sell it for 13 silbergroschen per pound.

2225. Therefore, although the dairy produce did not pay so well 20 or 30 years ago, it would be very much better now, with such an increase in the price of butter?—The labour and the land, and everything, is much dearer than it was in those days, and the profit is not large enough in proportion to the outlay.

2226. Then, so far as your experience goes, you find that fattening cattle pays better than dairy farming?—At present it does.

Mr. *Pease.*

2227. Are the cattle that are sent from Schleswig-Holstein here sent on consignment?—Yes.

Mr. *Pease*—continued.

2228. Can you state the prices which they are at present realising for the full carcase?—The price varies very much. It is not a time now that they ship, but the price differs between 18 *l.* and 45 *l.* sterling.

2229. For what weight?—The weight of a bullock differs between 4 cwt. and 12 cwt. I have received as much as 45 *l.* for a bullock.

2230. For what weight?—I think about 12 cwt.

2231. At what price do you think that the Schleswig-Holstein supply will cease in this country?—It would be a question what price could be realised in Germany; it would depend a great deal upon what they could dispose of in the German market.

2232. What is the lowest price that you have ever received for cattle in the English market?—Seven guineas.

2233. Would you go on at that price?—No.

Mr. Thomas Christopher Booth, Examined.

Mr. *Booth.*

Colonel *Kingscote.*

2234. I believe you farm to a large extent in Yorkshire, do you not?—I do.

2235. Both your own land and as a tenant farmer?—Yes.

2236. And you have done so from your earliest youth?—Yes.

2237. And your father before you?—Yes, and my grandfather.

2238. You are also a member of the Council of the Royal Agricultural Society, are you not?—I am.

2239. And I believe you breed largely?—I both breed and graze.

2240. You breed very high-pedigreed shorthorns, do you not?—I do.

2241. And you have a very valuable herd?—I have.

2242. You have also common dairy stock?—Yes, I breed a good many other cattle besides; I breed the ordinary Yorkshire shorthorned cattle, and also I feed off from 100 to 200 fat cattle every year.

2243. Have you experienced, during the time that you have bred stock, great losses through foot-and-mouth disease and other diseases?—From foot-and-mouth disease, especially, I have experienced very great losses.

2244. It, in fact, almost ruined your herd, did it not?—Between 1869 and 1872 my herd was reduced by the foot-and-mouth disease by more than one-half.

2245. You have had it more than once, have you not?—I had five separate attacks in my herd in less than three years.

2246. Can you tell the Committee how those attacks came on your herd; were they through your buying beasts from other markets, or from what other circumstances?—I never had an outbreak through buying cattle from a fair, but my farm is peculiarly situated; there are two public roads dividing it, and cattle are continually being driven to and fro along those roads from fairs and other places. In fact, one buyer for the London and other dairies lives on a farm close by me, and he is continually sending cattle

Colonel *Kingscote*—continued.

to and fro, which are driven from all parts of Yorkshire and the county of Durham.

2247. Will you tell us near what towns or how you are situated?—I am within two miles of Northallerton, 14 miles from Darlington, 30 miles from York. York and Darlington are the two great markets for store cattle and milch cows in the district.

2248. Owing to those cattle being driven along those roads, you have suffered to the extent you say?—Undoubtedly.

2249. And you are liable to it at any time?—Yes.

2250. Therefore I conclude that you are very well pleased that there is such a restriction upon the movement of cattle that none of those cattle can pass through your farm?—Undoubtedly.

2251. But, at the same time, those restrictions are very hard upon yourself and others who want to get your cattle to market?—They are. At the present time I cannot send my cattle, at least until within the last few days I could not send my cattle, to any part of either England or Ireland, or even abroad. The whole of the world, you may say, is shut against us at the present time.

2252. Has it been so since the outbreak of rinderpest?—Before that. Since the outbreak of 1872, Australia is closed against us, and New Zealand and America; in fact, all the world. We used to send shorthorns to the most remote parts of the earth, you may say.

2253. As I understand, since the outbreak of rinderpest, the restrictions upon the movement of cattle in Yorkshire have been such that you could not send your cattle anywhere except to market for slaughter, is that so?—Undoubtedly, it is so. There was no market whatever open in the North Riding; the whole of the markets in the North Riding were closed. The movement of cattle was quite free within the Riding itself, but no public sales were allowed. I could send my cattle to Leeds and Wakefield, the two largest fat meat markets for the West Riding, but only for slaughter.

2254. Therefore,

Colonel *Kingscote*—continued.

2254. Therefore, practically, for breeding purposes, the whole country has been shut against you and all others in Yorkshire, so far as any sale has been concerned?—Undoubtedly. When the cattle plague broke out at Hull, the justices for the North Riding immediately took steps to prevent the introduction of the disease into the North Riding, and they placed a double cordon of police round every possible outlet throughout the whole Riding, necessarily at a great expense to the ratepayers, in order to protect themselves against the introduction of cattle plague.

2255. Although it has been a great expense, I need not ask you whether you would not sooner bear your share of that expense than be subject to the rinderpest?—Undoubtedly so.

2256. But, at the same time, it enhances the price of animals to the breeder, if you wish to part with them, and to the consumer?—Undoubtedly it raises the price of meat. Meat has been dearer in our markets lately than it has been for several years.

2257. Now, as to the foreign trade; you have been accustomed for many years, I believe, to send a very large number of your high-bred stock abroad, some to America, a great many to our colonies, and some to the continent of Europe?—Yes.

2258. That exportation has been entirely stopped for some years now, has it not, except to America?—Yes. Australia has been stopped the longest. Australia was, at one time, our best customer for shorthorns. I could not say the number that have been shipped there, but a considerable number of bulls were taken out every year. I know, as a matter of fact, that at the present time there are orders in this country for probably 100,000 *l.* worth of shorthorns for Australia if the restrictions could be removed.

2259. The trade with Europe has now been stopped?—To Denmark bulls are sent every year. Mr. Swan, who was in the chair the other day, could have told you that he sends a great number of bulls every year to Denmark. To Germany, to Sweden, to France, and to Belgium. One agent in my district shipped the year before last upwards of 100 bulls and heifers to Belgium. Then to Canada there is a very large export, as well as to the United States of America. Those are all closed against us at the present time; even to Japan and Nepaul, as you know yourself, they went to a small extent. That shows that the value of these cattle is so great that they are sought for from all parts of the world, to improve the cattle of other countries.

2260. And even to Ireland you had a large trade, and that has been stopped?—Ireland is stopped against us at the present time; I may state that nearly the whole of the trade of sending bulls to Ireland has been in the hands of my family for the last 60 years; very few shorthorn bulls have gone into Ireland but have gone through the medium of my family; and I think it is pretty well known that the cattle of Ireland have been increased in value to a very considerable extent during that time.

2261. Therefore, the inability to send well-bred bulls to the world in general is not only a great loss to the breeder of those bulls, but, in your estimation, is a very great loss to the consumers of meat, as the breed is not increased in

Colonel *Kingscote*—continued.

quantity as it would be if those bulls went abroad to Ireland, and to every where else?—Undoubtedly so, because the shorthorn is known to be an animal that improves every other breed of cattle in existence. I believe a witness will come here who told me, and who will tell you, that it is entirely owing to the shorthorns that have been sent from England to America, that they are now able to send us great supplies of American meat.

2262. Do you know anything about the dead meat trade yourself?—I have taken some interest in it; I have been to Liverpool, and have seen the processes of meat discharging there from the vessel.

2263. What is your opinion concerning it; do you think it can be brought in a wholesome state?—As a matter of opinion, there is not the slightest doubt about it. It comes there in as fine condition as any meat could be in.

2264. As a farmer and a producer of fat cattle yourself, do you fear the dead meat trade?—Not the slightest.

2265. But you do fear the importation of disease?—Undoubtedly so. What I should ask for is perfect free trade. We are taxed at the present time to the extent that the disease is upon us, and we never know when we are free. We cannot go into our regular system as producers of meat on account of these diseases; we are quite open to go into fair competition with all parts of the world in the dead meat trade, provided we are kept free from these diseases.

2266. And you also feel that when this disease is in this country, and restrictions are put on you, it is a very hard case upon you not only to be debarred from selling your cattle, but also to have to pay the expenses of those restrictions?—Undoubtedly so. During this last outbreak of cattle plague, no movement of fat cattle could take place from any farm to Leeds or Wakefield without a 28 days' pass; and the Danish cattle were coming to Newcastle, and only 12 hours afterwards they could be sent to all parts of the country. Therefore, we were labouring under a very great disadvantage.

Mr. *French.*

2267. You said a few moments ago that between 1869 and 1872, owing to foot-and-mouth disease, your herd dwindled down to half; how did you lose those animals?—Breeding animals are particularly liable to abortion by disease. I will give an instance: In 1872 I had 17 cows in one pasture, and they all went down with disease, and the produce of the whole of those 17 cows was one calf. Against that I may set the present year, when we are perfectly healthy, and I have upwards of 40 calves on the farm at the present time.

2268. Do you think that that was entirely owing to foot-and-mouth disease?—Entirely so. I have not the slightest hesitation in saying so.

2269. In your experience, have you never known cattle to slip their calves in that way without having foot-and-mouth disease?—They do occasionally.

2270. Do you not find it contagious in those cases?—Undoubtedly.

2271. Is it not within the bounds of possibility that it may not have been foot-and-mouth disease?—Certainly not, because we take every precaution; as soon as we find a cow going wrong we remove it at once.

Mr. *Booth.*

6 June 1877.

Mr. *French*—continued.

2272. You are suffering a great deal of loss at present, I believe, from the restrictions which are in force?—We are suffering inconvenience rather than loss, because meat is higher at the present time than it has ever been before. I, as a breeder, am suffering from not being able to send my cattle wherever I like, not being able to export shorthorns to Australia or even to Ireland.

2273. But the taxes to keep out the disease are higher than they would be at another time; and not only that, but I understand you to say that you will lose your custom with regard to bulls and everything this year?—So far as Ireland is concerned, I do.

2274. Is not that so with regard to the rest of the country?—Ireland has shut her doors against the whole of this country.

2275. But is not England also shut against you, for instance, in Yorkshire?—It was at one time, at least certain districts; I do not say that the whole of England was, because some districts in England never adopted the cattle plague regulations; but those districts that adopted the cattle plague regulations undoubtedly shut their doors against my cattle going there.

2276. Are the regulations in force in your neighbourhood?—They cease to day, I believe.

Mr. *Pease.*

2277. How long has Yorkshire been shut?—Since the outbreak at Hull in January.

2278. For those four months you have been under a cordon?—Yes.

2279. Before that time you had a long period in which there were no restrictions whatever, had you not?—Quite so.

2280. How long has Australia been shut against you?—Since 1871 or 1872, I think; since the time that the foot-and-mouth disease raged so in this country; I think from 1869 to 1872 there was one continuous stream of foot-and-mouth disease running round the country, you may say.

2281. How long has America been shut?—Only since the outbreak of cattle plague, and Canada the same.

2282. Therefore, so far as America and Canada are concerned, your complaint only dates back to January?—It dates back to the time of the outbreak of cattle plague at Hull, or rather in England.

2283. To the last outbreak in Germany?—To the last outbreak in Germany.

2284. With regard to Ireland, it is the same thing, is it not?—As soon as the cattle plague broke out on this side, the import of stock into Ireland ceased.

2285. Therefore, so far as your complaint goes, it only dates back to the outbreak which came in from the continent, except as regards Australia?—Exactly so.

2286. Have you any idea how long the Australian regulation will be continued?—I believe that at the present time it is proposed to continue it until 1880.

2287. Then whatever regulation we might come to in this country would not affect that colony?—I have reason to believe that it would. If we were once declared free from disease in this country, Australia would be ready to receive animals from us.

2288. How long do you think that they would wish us to be in quarantine, supposing that we were to stop the entire importation of all foreign cattle into this country?—It is impossible for me to say; it is rather a matter within the province of the Australian people themselves; but I know, as a matter of fact, that it was proposed to take off the restrictions in June this year, if it had not been for the outbreak of cattle plague at the present time.

Mr. *Pease*—continued.

2289. On the presumption that Yorkshire has now removed the stoppages to your trade, do you not suppose that America, Canada, and Ireland will all follow?—I suppose they will; but if we have a further outbreak of foot-and-mouth disease, as regards the Colonies we shall be closed.

2290. Have you read Professor Brown's evidence before this Committee?—I have.

2291. Do you agree with him that, whatever we may do with regard to continental cattle, we shall have outbreaks of foot-and-mouth disease and pleuro-pneumonia?—Not altogether. A Return has been made which shows that in the last three years we had 1,400 cargoes of imported disease out of a total of more than 12,000; and Professor Brown and Professor Simonds have confessed that, from the time of the incubation of the disease to the time of its being able to be discovered, a very great number of cargoes must have escaped the inspectors. In fact, we know as a matter of fact that after the cattle have passed the inspector it has been discovered in the London market, and I have no doubt that many of those cattle escape into the country and spread the disease.

2292. How long is it since you were at Liverpool inspecting the arrival of the American meat?—In April.

2293. Had you heard at that time whether there was any probability of the American dead meat trade ceasing?—Certainly not.

2294. Have you seen the evidence which was given, the last time this Committee sat, upon that question?—I heard Mr. Swan's evidence, but I do not think it is worth much. I think two or three days will convince you to the contrary.

2295. You do not believe in it?—Certainly not.

Mr. *Chamberlain.*

2296. I understand that, since the outbreak until to-day, no live cattle have been permitted to leave the North Riding?—No live cattle except for slaughter. It was simply within the radius of Yorkshire; but the western counties of England, to speak more correctly, such as Westmorland and Cumberland, that were lying away from the cattle plague district, would admit breeding animals from certain districts with a 28 days' pass.

2297. Then, if the counties of Westmorland and Cumberland would do it, and could do so wisely, might not all other counties have done the same?—The fear of the spread of disease was such that they did not think it necessary to do so. In fact, Cheshire closed itself for 40 days, and Gloucestershire, I think, for 28 days. The local authorities in each different district do not always take the same view of the matter, and they act according to their own ideas.

2298. Therefore the fear of cattle plague, or of the possibility of infection, differs very much in different districts?—Yes; I suppose it was thought in Westmorland that we in the North Riding

Mr. *Chamberlain*—continued.

Riding had taken such precautions to prevent the production of cattle plague into the North Riding that they might allow us, under certain conditions, and with 28 days' good health, to send cattle there; but whilst they would do that, we would not receive any from them.

2299. Do you think that it would be safe in all cases to allow the movement of animals from an infected district with a pass from a qualified inspector?—No, certainly not.

2300. It must be left, then, to local discretion to decide whether, and under what conditions, they will receive cattle from an infected district?—I hardly understand the question.

2301. At the present time, as I understand, each local authority exercises its own discretion as to whether it will receive any cattle from a district in which cattle plague is supposed to exist?—Yes.

2302. And you think that that must continue?—It undoubtedly must continue if the cattle plague is in the country, unless, as I should recommend, the Government take the matter into their hands entirely, and supersede the local authorities, as they did in the recent instance in London.

2303. Do you think that Westmorland and Cumberland at the present time are running any risk in taking your cattle with a 28 days' pass?—Certainly not, from the North Riding, because we have taken every precaution that we could to get rid of the disease, and so long as the disease was in the East Riding it would have been quite safe for any animals to have gone from the North Riding to any other part of England.

2304. Confining it entirely to the North Riding, you think that there was no risk in the case of the regulations made by Westmoreland and Cumberland, and therefore you see it follows that the regulations which other counties made, and by which your cattle were excluded, were unnecessary?—They did not think so; they were simply protecting themselves against the spread of the disease. The disease was brought into Hull, and the utmost alarm prevailed at once; and a deputation waited upon the Duke of Richmond, and asked him to prohibit the York market, and to close the East Riding, and he did so within a few hours; and had it not been so, the cattle would have probably gone from Hull to York, and would have been distributed all through the country. Therefore we in the North Riding immediately took what measures we could to prevent those animals coming upon us. We suffered very considerably in 1865 and 1867 from disease; no district of England perhaps, except Cheshire, suffered more, and we knew from sad experience that the best thing that we could do was to prohibit movement.

2305. Where the matter is left to local discretion it is probable, is it not, that some authorities, at any rate, may exercise unnecessary stringency?—I should not like to say that.

2306. If Westmoreland and Cumberland were right in not adopting those regulations, must not other counties have been wrong?—I should not like to say so.

2307. On the whole, do you consider that the advantage of these stringent regulations outweighs the disadvantage?—I think, undoubtedly, whilst we have to put up with inconvenience to keep out the disease, it is much more to our advantage to bear the cost of these restrictions than to have the disease brought in upon us. The same with foot-and-mouth disease; we are willing to undergo the greatest restrictions to stamp out foot-and-mouth disease, if we can get quit of it.

Mr. *Chamberlain*—continued.

2308. You say that these restrictions have raised the price of meat in the North Riding; do you know to what extent that effect has been produced?—I have sold cattle myself in the last 10 days at 9 *d.* a pound; that is a rise of 1 *d.* a pound since Christmas. Meat at Christmas, in the North Riding, was about 1 *d.* a pound lower.

2309. These restrictions were brought into existence when the cattle plague broke out, were they not?—Yes, in January.

2310. Have you ever had similar restrictions as against foot-and-mouth disease and pleuro-pneumonia at a time when the cattle plague was not in the country?—No.

2311. Is the transit of animals free at other times when there is no cattle plague?—I do not recollect the regulations just now, but no diseased cattle are allowed to be moved, if they are known to be diseased, subject to penalties.

2312. Have you been allowed to move healthy cattle without any restriction at a time when foot-and-mouth disease and pleuro-pneumonia were prevalent in the country?—Undoubtedly so.

2313. That is not so in all towns, is it?—No restriction has been adopted in the North Riding, beyond the fact that you cannot move diseased animals. I should like to point out to the Committee that in the year 1875 I had an attack of foot-and-mouth disease on my farm, and in six fields by the roadside animals were ill with foot-and-mouth disease; I was prohibited from removing those animals, but any other man could drive his cattle along the lane, past the animals that were diseased, without let or hindrance; so that he might actually take the disease all through the country from my cattle, and, in fact, I have no doubt that my cattle got it in that way.

Mr. *Norwood.*

2314. I understand that you are willing to submit to severe restrictions in case of need?—Yes, in order to stamp out foot-and-mouth disease and pleuro-pneumonia.

2315. And those severe restrictions enhance the price of your cattle, do they not?—For the time they might, but I believe that the effect will eventually be to lower the price of meat, and we shall be quite ready to sell it at a lower price, because we can produce it at a cheaper rate.

2316. Then this advance of 1 *d.* per lb. is only temporary?—The advance of 1 *d.* per lb. is only temporary on account of the restrictions; I think that it will probably be found within the next few weeks that our markets will go down again. Of course that is a mere commercial matter of supply and demand.

2317. Then you, naturally, view Hull with a considerable amount of anxiety and suspicion with regard to the disease?—Undoubtedly so.

2318. Are you aware that evidence was given in this room a few days ago, that there was no absolute mathematical certainty that there was cattle plague in Hull at all this year?—I have read all the evidence given here, and I am not aware of anything of that kind having been stated.

2319. Are

Mr. *Booth.*

6 June 1877.

Mr. *Norwood*—continued.

2319. Are you aware that Professor Brown stated that he was not absolutely confident that a true case of rinderpest had occurred at Hull this year?—I cannot put that construction upon what I have read of his evidence.

Mr. *M'Lagan.*

2320. Is that rise of 1 *d.* per lb. in the price of beef due to the restrictions, or is it due simply to the difference in the season?—It is due to the restrictions at present, I think.

2321. Is beef not generally dearer at this time of the year?—It has risen within the last two months. Up to May it is generally low, and then in June and July it rises, and then it fluctuates according to the supply.

2322. I understand from your evidence that you would advocate the prohibition of the importation of all live-stock into this country?—Undoubtedly so. We are quite prepared to put up with the restrictions on our own cattle to stamp out diseases, providing that the risk of importing foreign disease is also taken away.

2323. And you would allow the free importation of dead meat?—Undoubtedly so.

2324. Have you ever considered what would be the effect upon the price of beef in this market if you prohibited the importation of live-stock, and allowed the importation of dead meat alone?—It is hardly a question that I have considered.

2325. Do you think that it would have the effect of raising the price of beef?—I cannot see why it should. You can bring the carcase at a cheaper rate than you can bring the live animal.

2326. Speaking as a practical farmer, your reason for advocating the prohibition of the importation of live-stock, and the free importation of dead meat, is not that it will raise the price of beef, but that you wish to protect your own stock?—Yes. As I said just now to an honourable Member, I would sooner sell my beef at a cheaper rate if I were able to produce it cheaper, and I know I can produce it cheaper by being free from disease.

2327. There has been a considerable rise in the price of beef and dairy produce in the last 10 or 15 years, has there not?—Undoubtedly; since there was such very great prosperity in many of our trades, there are more beefeaters in the country.

2328. You think that the rise in the price of meat has arisen more from the greater consumption of meat than from the scarcity of cattle on account of disease?—I think that we, as producers of cattle, could not only produce meat cheaper in the future, but we could have produced a greater quantity of meat in this country in the last 10 or 15 years if we had been free from disease. Take my cattle on my farm at the present time; they should go to market in August; supposing at that time they break out with foot-and-mouth disease, they go down, and I am obliged probably to keep them till the Christmas following. Hence I am only able to feed off one lot, when I could have fed two lots.

2329. The risk of producing beef now by the farmers of this country is far greater than it used to be, is it not?—Undoubtedly so.

2330. And the loss that the farmers experience from cattle dying from disease is greater than it used to be?—I think it is; the outbreaks of foot-and-mouth disease from 1869 to 1872 were more severe than any I ever knew. I believe Professor Simonds stated that it was more severe in 1841, but the losses from death were more from 1869 to 1872 than I ever knew in my experience, because, as a rule, it produces abortion in cows, and takes their milk away, and cripples them for a time; but those animals in three or four months' time will perhaps come round again, but at that time numbers of animals were actually killed by the disease.

Mr. *M'Lagan*—continued.

2331. Then on account of that risk and loss the price of beef has been enhanced?—I think so, unduly.

2332. Have you had any fatal cases of foot-and-mouth disease?—At the time I named, five or six of my best animals pined away, as we term it. The disease was so severe upon them that it went into the feet, and they became prostrate; then the digestive organs ceased to operate, and they subsequently died.

2333. But the foot-and-mouth disease is not generally reckoned a fatal disease, is it?—Not as a rule.

2334. But though it is not a fatal disease, the loss from the disease is very great, on account of the loss of condition in the animal?—Yes; the loss from the disease is very great on that account, and from the hindrance we are put to, in not being able to get them fat at the proper time.

2335. Do you think you could prevent foot-and-mouth disease if there were no importation of live-stock?—I do not see why we should not. Professor Brown told me, individually, that we should have foot-and-mouth disease all through this country this spring; and he has since told me that the restrictions that have been put on in consequence of the cattle plague have stopped his prophesied outbreak.

2336. Is it not invariably the case that when you have any very great restrictions with regard to any particular disease you have fewer cases of all other diseases?—Undoubtedly. It was the same in 1867 and in 1877 in the country; I do not know what it was in London.

2337. Therefore, as a practical farmer, you would approve of these restrictions, were it for nothing else than the general advantage of the country?—Undoubtedly so.

Mr. *Elliot.*

2338. You are a member of the Yorkshire Agricultural Society as well as of the Royal Agricultural Society, are you not?—Yes, I am on the council.

2339. Have you read Professor Brown's and Professor Simonds' evidence?—Both.

2340. What is your opinion as to the way in which the proposed restrictions would be received by the farmers of your district?—I believe that the opinions of the farmers of the country are quite changed as regards the foot-and-mouth disease from what they were six or seven years ago, and that they would now hail with pleasure any restrictions which they see to be necessary, because we know that the cattle plague restrictions have almost succeeded in stamping it out; but I also believe that were those restrictions continued at the present time, as Professor Brown proposes, in districts were there is foot-and-mouth disease, it might be eventually stamped out altogether.

2341. You

Mr. *Elliot*—continued.

2341. You have been an abnormal loser by foot-and-mouth disease, have you not?—Very large indeed.

2342. Can you give the Committee any idea of what your monetary loss has been in the last 20 years?—It is rather a large sum; certainly somewhere between 30,000 *l.* and 40,000 *l.*, I should think, speaking moderately.

2343. You say that the increase in the number of cattle in Ireland has been mainly owing to the introduction of shorthorns there?—We claim that my family have done more for Ireland than many other people have done. For 60 years we have had the whole of the shorthorn bull trade in our hands.

2344. Can you state the approximate amount of the increase of the exportation from Ireland to this country in the last few years?—I have not seen the returns, but I have understood when I have been in Ireland that the cattle in the last 25 years have increased to about four times the value.

Mr. *Torr*.

2345. Do you think that it would be possible to stamp out the foot-and-mouth disease in England?—I think so, because, as I have already stated, the present cattle plague restrictions have shown that it is so.

2346. Of course it would be at great cost?—I think we should not grumble at the cost. I think the cost of stamping out foot-and-mouth disease would be nothing as compared with the loss that we have suffered from the disease.

2347. Do you think that the supply of beef to this country will be ultimately increased or decreased by our precautions?—I am quite certain that we could produce a great deal more meat in this country if we were free from disease.

2348. You think, then, that at whatever cost the foot-and-mouth disease was stamped out, it would be a great gain to the food production of this country?—Undoubtedly.

2349. To the large towns it would be a great gain?—I am certain of it.

Mr. *W. E. Forster*.

2350. You say that you think that the present cattle plague restrictions have stopped the foot-and-mouth disease?—I have Professor Brown's word for it.

2351. In what counties of England are those restrictions?—I do not know at the present time. I believe there are very few centres at the present time. I think only one in the West Riding, and none in the North Riding or East Riding.

2352. Is it not the case that those restrictions only exist in two or three of the counties of England?—At the present time they exist only in a few, but they have been in force in a great part of England during the last three or four months.

2353. This year?—Yes. You have a better knowledge upon the subject, no doubt, than I have, but I have not studied the number of the counties that have put the restrictions in force.

2354. I have no special knowledge upon the subject, but my impression was that, by order of the Privy Council, these restrictions were ordered for one of the Ridings of Yorkshire, to Lincolnshire, and to Essex?—But the local authorities of the different counties put the restrictions in force themselves without the authority of the Privy Council.

Mr. *W. E. Forster*—continued.

2355. Is it not the case that it has been only done in two or three counties?—No; I am open to correction, but, speaking off-hand, I should say that they have been in force in three-fourths of England at least, and I think in Scotland as well.

2356. Supposing that it should turn out that they were only in force in a few counties, you would acknowledge that foot-and-mouth disease cannot have been stopped in England by the restriction?—It must depend upon whether there was foot-and-mouth disease existing in those counties to begin with.

2357. Do you think that England is free from foot-and-mouth disease at the present time?—It never has been so free, I believe, for many years.

2358. You have paid great attention to the history of these disease, I believe; has it not been frequently the case, that you have had years very much without foot-and-mouth disease?—Not altogether; it ebbs and flows, undoubtedly.

2359. Although that has been very much the case, the country has never been absolutely free?—I am not aware that it has.

2360. I suppose you have paid enough attention to the subject to be aware that foot-and-mouth disease first appeared in England at the time that the import from the Continent was prohibited?—Yes, but I believe it was accounted for by appearing first very near London, where ships' stores might have escaped. Professor Simonds stated, I believe, something of that kind.

2361. I understand that what you would advise is, that there should be a total prohibition of the import of live cattle from the Continent?—I should like to see it. I am one of those who believe that eventually the whole trade of this country must be dead meat.

2362. Do you advise that that should be done?—I advise that that should be done, and failing total prohibition, I should prohibit the import from those countries which had any disease whatever, either foot-and-mouth disease, pleuro-pneumonia, or cattle plague.

2363. You think that the farmers of England would be willing to submit to very strong restrictions, in order to stamp out pleuro-pneumonia and foot-and-mouth disease?—I do.

2364. And after that time you would like to have entire free trade as between one part of England and the other?—I should.

2365. What would you do with the Irish import?—I should treat Ireland exactly as I should treat England.

2366. You would have the same reliance upon the present regulations in Ireland through the Government at Dublin as you would have upon the regulations in England?—I believe that the Irish regulations differ from those in force in England; they are under a rather different system of government, but I have no doubt that they could take sufficient measures in Ireland as in England if the same law applied to the whole country.

2367. Would you be prepared to stamp out foot-and-mouth disease by slaughter?—No; I think that Professor Brown's proposal of declaring a district infected, and totally stopping the movement of cattle in that district, would be sufficient.

Mr. *Booth.*

6 June 1877.

Mr. *W. E. Forster*—continued.

2368. I think that in 1874 the Privy Council renewed the permission to the local authorities in different counties to have more stringent regulations with regard to foot-and-mouth disease; has the North Riding availed itself of that permission?—No; I am not aware of any measures that have been taken to put that in force.

2369. You have no regulations except those that are compelled by the Act?—The regulations are simply as to the stoppage of the movement of diseased animals.

2370. When had you foot-and-mouth disease prevailing last in the North Riding?—In 1875 it prevailed very generally.

2371. Did it prevail last year?—Not so much.

2372. Then it could hardly be the regulations with regard to cattle plague which has stopped the foot-and-mouth disease in the North Riding this year?—The foot-and-mouth disease, since the cattle plague regulations have been put in force, has disappeared in the North Riding.

2373. To what extent had you it before?—That I cannot tell you. I have no data to go by.

2374. I suppose that practically you have not had much trouble with it since 1875?—It has simply gone on, and we have taken no notice of it.

2375. But you, with your great attention to the subject and your great interest in the matter, would take notice of it, I presume, if it were there?—No doubt I should, if it were in my neighbourhood; but it has not been in my neighbourhood, and I have not, therefore, gone into the question.

2376. Do you make the suggestion that the import of live cattle should be prohibited because you fear the introduction of cattle plague, or because you wish to stop pleuro-pneumonia and foot-and-mouth disease?—I assume, from Mr. Elliot's Return (I think it was), that some 1,500 cargoes of diseased cattle came in in the last three years, and altogether there were 12,000 cargoes of some kind or other imported; and I think that we have reason to assume, knowing the length of time before foot-and-mouth disease, and those other diseases, appear, that many cargoes escape the notice of the inspectors. It has been acknowledged that inspection is of no use whatever.

2377. If there was no such disease as cattle plague, you would still strongly press this suggestion that live cattle should be prohibited?—I should.

2378. It is mainly upon the evils that come from pleuro-pneumonia and foot-and-mouth disease that you base that suggestion?—I am certain, in my own mind, that the consumers of meat in this country are far greater losers by having disease in the country, than they would be if we could breed a greater number of animals, and feed a greater number of animals, in a healthy state.

2379. And you have full confidence that, if import was stopped, you would be liable to get rid of those two diseases?—The stoppage of the import would minimise the risks.

2380. You believe that you would be able to get rid of it?—I think so.

2381. And you are not one of those who believe that those two diseases are now acclimatised in England?—They may be acclimatised to a certain extent, but still I think that they are foreign diseases, and I agree with Professor Brown that it is possible to stamp them out.

2382. Do you consider the statement true, that in no country in which these diseases have really taken root have they ever yet been stopped?—I think that Professor Müller stated something to that effect, but I do not know that they have taken any strict measures to stamp it out. The last witness just now stated, I think, that it had been stamped out in Schleswig-Holstein. There have been outbreaks, but they have put their finger upon them at once. I think the gentleman from Schleswig stated that there had been several outbreaks of foot-and-mouth disease, and that the measures taken by the Government are sufficient to stamp it out.

2383. Did you read the evidence given in 1873?—I did not.

2384. Therefore you are not aware of the statement which was made by the witnesses then, that no country had succeeded in stamping it out?—I am not aware.

2385. And that exceedingly stringent measures have been taken in Switzerland without success?—I am not aware of the fact.

2386. Independently of your very costly herd, which is so well known, besides breeding those very valuable animals, you also breed what we may consider animals for the general market, do you not?—Yes, I do.

2387. And consequently you sometimes send a considerable number of animals to market to sell?—Yes; Leeds and Wakefield are our principal markets.

2388. Supposing that one of those animals happened to have foot-and-mouth disease that animal would be obliged to be slaughtered?—It would be obliged to be slaughtered.

2389. But to all the animals that had been in contact with it nothing would be done?—Nothing; the disease would remain to develop itself.

2390. Comparing your position in sending these cattle to market with that of an importer from the continent, I suppose that you are aware that if one importer sends 20 animals on board a steamer to London, and if other importers send other 80, making up 100, and that if one of those other animals has the foot-and-mouth disease the whole of the hundred are killed?—Yes, I believe that is so.

2391. Therefore is it not the case that the regulations with regard to animals which are affected by foot-and-mouth disease coming from abroad are at this moment very much more stringent than they are upon the home producers?—Undoubtedly they are to that extent, and that is the reason why I advocate total prohibition. I think they had far better send the meat from the other side and have done with the annoyance which your question suggests.

2392. You are quite aware of the fact that the Government takes very much greater pains at the present moment to prevent disease coming from abroad than it does to prevent disease, at any rate, foot-and mouth disease, being spread from one district to another?—It does to the extent of killing diseased animals, or animals that have been in contact with diseased animals; and I believe that a great number of other animals escape the inspectors that are never condemned at all. Probably far more animals escape

Mr. *W. E. Forster*—continued.

escape than are caught. I have a right, I think, to assume that.

2393. Do you not think that a great number of the animals that go into Islington Market go away from it and escape detection?—It has been discovered in the Islington Market after they have passed the inspector.

2394. Do you not think that the same remark would apply to home animals going to Islington Market, that a good many animals would go there with foot-and-mouth disease, and go out without its being discovered, and affect other parts of the country?—I think that if an animal has foot-and-mouth disease in the Islington Market it is seized at once.

2395. My reason for asking that question is that you said that you thought that foreign animals that had foot-and-mouth disease escaped detection; probably the disease had not fully developed itself; do you not think that the same remark may apply to the home animals?—It may to a certain extent, but I ask that Professor Brown's restrictions shall be put in force, and that if there is an outbreak of foot-and-mouth disease all movement should be stopped.

2396. Are you in the habit of buying animals that come from Ireland?—Never.

2397. But you know farmers that do, do you not?—Yes.

2398. And I suppose that they frequently buy them at an English market?—Yes.

2399. Do you not think it likely that animals that come to that market had foot-and-mouth disease, but that nobody has found it out?—Undoubtedly so.

2400. But those animals are spreading disease in the same way as animals that come from abroad, are they not?—Yes; but I should put Ireland under the same ban as England, and stop the foot-and-mouth disease in Ireland. I believe that it is imported into Ireland. I do not believe that it is generated there, as was stated by Mr. Swan. A large number of calves are sent over there every year, and I believe that those calves in a great measure take foot-and-mouth disease to Ireland.

2401. Supposing that the import of live animals was prohibited, and that the Government were then to set to work to stamp out foot-and-mouth disease in these two islands, what would be the regulations which you would propose for stamping it out?—Simply the regulations that are now in force, except the killing. I should stop the movement of all cattle in infected districts.

2402. For all England?—No; in the districts. I should draw a cordon around a certain district where it might be thought necessary by the Veterinary Department of the Privy Council, and stop the movement of cattle in that district.

2403. What would you do with the large markets?—If necessary I should not hesitate to stop them for the time being. There are always sources of supply of meat.

2404. Would not that really imply the stoppage of all the large markets?—It does not follow at all.

2405. Take the market at Norwich-hill; supposing that foot-and-mouth disease was in the county of Norfolk (I do not know whether it is or not), do you still think that you would have any chance of stamping out the disease if you allowed any cattle to go to Norwich?—If the foot-

Mr. *W. E. Forster*—continued.

and-mouth disease broke out in the district of Norfolk, I should stop the market at once.

2406. My object is to find out what would be the inconvenience to the trade generally of those stamping-out regulations, and therefore I want to know what you consider that it would be necessary to do; do you think it would be enough merely to stop the markets where you knew that foot-and-mouth disease was existing?—I should not allow an animal to be removed outside a district in which foot-and-mouth disease was prevalent. I should take a certain large area, and then stop the total movement of cattle in that district, as is done in Germany in case of an outbreak of cattle plague.

2407. The reason why I ask this question is, that the witnesses whom we examined in 1873, Professor Brown and one or two others, gave a very strong opinion, that it is useless to attempt to stamp out foot-and-mouth diseases, by stopping movement in only one part of the island, but that it must be stopped everywhere?—I do not think that that is Professor Brown's opinion now, and it is not mine.

2408. On the 15th May last, I asked him this question with regard to foot-and-mouth disease, "You say that you do not believe that the stock owners of the country would comply with the restrictions that would be necessary?"; and he replies, "That is my conviction. If those regulations were enforced, what people in this country call free trade, that is to say, the right which every man possesses to drive a bullock in any direction he likes, and to any market, and to as many markets as he pleases, must necessarily be totally interrupted, and I do not believe that traders generally would put up with those restrictions." You do not think that it would be necessary to have the trade totally interrupted?—I think that it should only be done in the district where foot-and-mouth disease existed.

2409. With regard to pleuro-pneumonia, how would you hope to stamp it out?—There have been certain regulations in force, as to slaughtering in cases of pleuro-pneumonia, and I believe that those regulations, in the country at any rate (I do not know how it is in London), have considerably reduced the outbreaks in the kingdom, but pleuro-pneumonia would undoubtedly come under the same regulations as cattle plague or foot-and-mouth disease.

2410. How long do you think it requires for pleuro-pneumonia to develop itself so as to be visible?—I have no experience whatever; I never saw a case that I am aware of.

2411. I asked Professor Brown this question: "I daresay that you will remember, that before the last Committee, there were some witnesses who stated that they thought that stopping the movement of cattle for six weeks, would enable foot-and-mouth disease to be stamped out of the island"; to which Professor Brown says, "I remember that statement." Then I asked him, "You are not of opinion that that time would be anything like enough?"; and he answered, "Certainly not; if we could do it in six years, I should think the work would be very well done." Supposing that Professor Brown is right in that, do you think that the farmers of England would bear a restriction of movement for six years?—I should think so, because it would only apply to such districts as the foot-and-mouth disease was prevailing in at the time.

2412. Supposing

Mr. *Booth.*

6 June 1877.

Mr. *W. E. Forster*—continued.

2412. Supposing that Professor Brown is also right in his statement that the movement would require to be totally interrupted, do you think that the farmers would stand it?—I do not think that that is his opinion.

2413. Do you think that, supposing it to be the case that throughout a good part of England the movement would require to be stopped for six years, the farmers would bear it?—I do not contemplate such a thing at all; I think that wherever an outbreak occurs, if movement in that district is stopped we shall get quit of it in less time.

Chairman.

2414. With regard to these regulations, I understand you to say that you consider that pleuro-pneumonia and foot-and-mouth disease might be stamped out by applying similar regulations to the places where the disease was discovered to exist to those which were in force with regard to cattle plague?—Undoubtedly so.

2415. And though it might be a slow process, still if those regulations were applied wherever the disease was discovered in time, you would be able to eradicate it from the country?—I think quite so.

2416. You found that supposition very much upon what was known to be the fact at the time of the outbreak in 1865, 1866, and 1867, when the cattle plague restrictions which were in existence for a long period did almost entirely eradicate the disease?—Almost entirely, I believe.

2417. And also upon the fact that when in Denmark and in Schleswig-Holstein they have had outbreaks of both these diseases, pleuro-pneumonia and foot-and-mouth disease, they have, by the application of similar restrictions, eradicated both those diseases, and are practically free from them at the present moment?—That has very much strengthened my opinion.

2418. And you state further that you believe, from your acquaintance with the farmers as a body, that they would be prepared to submit to such restrictions, the end in view being entire and absolute freedom from those diseases?—I think that they would submit to that.

2419. On the ground that if by those regulations, combined with a restriction of importation, these diseases were once eradicated from the country, it is probable that they would not break out again?—That is my opinion.

2420. It has been stated that these diseases existed in this country before the importation of foreign cattle took place; I understand you to say that you believe still that they originated from the continent, because ships' stores were disembarked at most ports, and they might have been the cause of its introduction?—Yes; I only know from what I have read of what Professor Brown said.

2421. I was under the impression that Professor Brown had said that he had changed his opinion with regard to the entire suppression of the disease. The Right honourable gentleman the Member for Bradford has pointed out to me that, in answer to Question 547, Professor Brown said that he was decidedly of opinion that the movement of cattle must be restricted with regard to the whole of the country. If that was not carried out you would still be of opinion that, by doing it by degrees, although taking

Chairman—continued.

longer, you would eventually eradicate those diseases?—I think so. Professor Brown also stated that he believed that the country would never stand it. He took rather a strong view of it; but I think that he has misapprehended the feeling of the country at the present time.

2422. Your impression being, that whilst the farmers may have, as a body, objected to these restrictions some years back, yet that, from their losses, and from the diminution of their profits, they have changed their minds, and are prepared to submit to such restrictions?—Undoubtedly so.

2423. With regard to the import from abroad, the opinion which Professor Brown expressed to the Committee was, that whilst prohibiting, absolutely, the import from Germany and Belgium, the unscheduled countries, such as Denmark, and Spain, and Schleswig-Holstein, should be allowed still to send their cattle into this country free; you are not of that opinion?—I look for a total dead-meat trade.

2424. Looking to the fact that it has been shown that from Denmark a very large trade exists, and that that country is almost absolutely free from all these diseases, and that there are protections as against the import of disease into that country which are far more stringent than any that we ourselves attempt, do you think that, under those circumstances, you would be obliged to prohibit the import of live cattle from that country?—I think if you do not restrict altogether those countries that take such severe measures to keep down the disease, they are the only ones that should be allowed to send live cattle; but in the case of an outbreak of disease in any one of those countries either of pleuro-pneumonia or of foot-and-mouth disease, I should immediately prohibit the importation of stock from that country.

2425. I understand you to say that whilst, perhaps, it might be advisable, where countries could prove their immunity from disease by their own restrictions, to allow of the trade being continued with those countries, it would be sufficient, in that case, to protect ourselves by prohibiting importation on the first outbreak there?—It would minimise the risk, no doubt; but we know that, as late as last November, Denmark was supposed to be free from foot-and-mouth disease, and it appeared in Danish cattle that were imported to Newcastle.

2427. There was one instance in which seven animals were infected with foot-and-mouth disease, but it was detected?—Yes.

2426. And from the nature of foot-and-mouth disease it is generally believed that you can detect it?—I am not of that opinion at all.

2428. You stated, I think, in answer to the Right honourable gentleman, that the powers of the different localities had put in force different restrictions during the last outbreak?—During the cattle-plague outbreak it has been a general order throughout most of the kingdoms, I believe. I only know two countries in which it was not put in force: Leicester and Cornwall.

2429. Did they carry it out in the West Riding?—The markets only for fat cattle were left open at Leeds and Wakefield for a certain time, and I believe that the cattle were obliged to be branded for slaughter, to show that they could not be moved to any field. A great number of people were fined in the West Riding for moving the animals and breaking the law.

2430. There

Chairman—continued.

2430. There was a great difference in the orders of the different localities, was there not?—Undoubtedly.

2431. In your opinion is it advisable that that should continue, or that greater powers should be given to the central authority to lay down regulations at once upon any outbreak, those regulations applying equally to all districts?—I am strongly of opinion that the whole of the regulations should emanate from the Privy Council office.

2432. That is to say, that you would be willing to transfer to the central authority the power which is at present exercised by the local authority with regard to these contagious diseases?—Quite so; I think that the local authority would be quite willing to give up their power.

2433. Would you allow the inspectors to be appointed by the central authority in the various districts?—Yes, I think so. I think that they should be all subject to one head, say to Professor Brown.

2434. Do you think it would be any injustice that the cost of inspection should be a charge upon the local rates in that case?—I do not think that there would be any objection to it, but I am strongly of opinion that it should be an Imperial charge, as is the case in Germany with regard to cattle plague.

2435. I understand you to say that you would make this transfer at once by Act of Parliament altogether?—I think that you would probably have to repeal the Act of 1869.

2436. You would not bring into operation the Privy Council's powers whenever disease broke out anywhere, but you would make it generally a power to the Privy Council to deal as they saw fit in all districts with cattle diseases?—Undoubtedly so.

2437. At the same time you believe that the localities would not object to having the charges made upon the local rates for the inspection, although you yourself think that it ought to be an Imperial charge?—I do not think they would; I should not like to speak for large towns, such as London, for instance, but I believe that in the rural districts in the Quarter Sessional Divisions there would be no objection. Taking the large towns, we know sometimes they do not like having the powers taken out of their hands.

Mr. *Chaplin.*

2438. Do I correctly understand you to say that you attribute the origin of these diseases, cattle plague, pleuro-pneumonia, and foot-and-mouth disease, entirely to the importation of live stock from the Continent?—Originally, undoubtedly they were foreign diseases.

2439. Is there any plan, in your opinion, short of entire prohibition of import from countries on the Continent that have ever been infected, by which we could hope to get rid of these diseases in future altogether?—I seek to prohibit the importation of disease from foreign countries, and at the same time I wish to see it stamped out by proper regulations being put in force in this country.

2440. You think that the entire prohibition of the importation of live cattle is essential in the first place?—I would not say that there should be an entire prohibition of the importation, because where countries have no disease, and have never had any disease, as I have said to the Chairman, that would alter my opinion slightly; but wherever there was the disease in any country, I should prohibit importation from that country entirely.

Mr. *Chaplin*—continued.

2441. I am speaking only of countries where there is infection; if the importation was entirely prohibited, you have no doubt, have you, that we should get rid of those diseases altogether?—In course of time.

2442. In what space of time?—Professor Brown says six years, but I think that if an Act could be passed giving Professor Brown power, within a few weeks from this time, he could lay his hands on the disease and stamp it out in a very short time. There might be fresh outbreaks, but every fresh outbreak would be known and would be nipped in the bud.

2443. Without it being necessary to adopt the very stringent measures which he recommended throughout the whole country?—Undoubtedly so.

2444. Then you disagree with Professor Brown?—I fancy that I have put a right construction upon Professor Brown's evidence, but I should not like to be certain.

2445. You think that it would be sufficient to apply the stringent regulations to infected districts only and not to the whole country?—I do if the disease broke out in a certain district. Professor Brown proposes to have a certain number of inspectors throughout the country; he proposes to map out the country into certain divisions, with a head inspector in each district, and sub-inspectors under him. Whenever foot-and-mouth disease broke out in anyone of those districts, I should declare it infected and stop the movement of cattle within a certain area.

2446. Then you do not think it necessary to do as he says, viz., to place the most stringent regulations for a time upon the whole movement of cattle in the county, fat or lean?—I do not think that it is necessary. If he thought it necessary it might probably do it sooner, but I think that the other proposal would answer the purpose.

2447. I understood you to say, that supposing that we were freed from all risk of disease by foreign importation, you would largely increase the home-bred cattle in this country?—Undoubtedly cattle breeding has been to a great extent stopped by the prevalence of disease. Evidence will be given, I believe, by men who have actually been obliged to adopt another system of farming in consequence of these diseases.

2448. You think that the increase in the breeding of home-bred cattle would be more than sufficient to compensate for the loss by the prohibition of the importation of foreign cattle?—I think so.

2449. Supposing that the importation of live cattle from infected countries was entirely prohibited, and that the number of home-bred cattle was very largely increased in consequence of your freedom from all risk of disease, what in your opinion would be the effect upon the price of meat in this country?—It is a question of supply and demand. If there was an increased supply it must lower the price, and I could afford to sell it cheaper, because I was able to make it at a cheaper rate, the same as any manufacturer.

2450. In fact, you think that it would be a general

Mr. *Booth.*

6 June 1877.

Mr. *Chaplin*—continued.

general advantage to the consumer and to the producer as well?—Very much so indeed.

2451. Under those circumstances, do you think it at all likely that arable land would be reconverted into pasture land?—No, I do not think it would make any difference in the course of husbandry in the country.

2452. Do you remember what the rise in the price of meat was after the outbreak of cattle plague in 1865, 1866, and 1867?—I do not remember. I have never looked into the question.

2453. There was a considerable rise, I think?—I think there was, but I do not recollect what the rise was.

2454. Whatever rise there was, was entirely in consequence of that outbreak of cattle plague?—Undoubtedly.

Mr. *Arthur Peel.*

2455. What are the diseases in this country which induce foreign countries to prohibit the import of our cattle?—Foot-and-mouth disease and pleuro-pneumonia especially. Australia and New Zealand prohibit import on that account.

2456. They would prohibit the importation of your cattle so long as either foot-and-mouth disease or pleuro-pneumonia was in this country?—Yes.

2457. They have done that up to the year 1880, I think?—The prohibition is in force until

Mr. *Arthur Peel*—continued.

that time, but of course it is liable to be rescinded if we are free from these diseases.

2458. What are the regulations as to the Continent?—The whole of the rest of the restrictions are put in force on account of the cattle plague. The whole of the rest of the world, you may say, is shut against us on account of cattle plague.

2459. When you speak of wishing to prohibit the total importation of live stock into this country, do you mean that you would prohibit the importation as long as any of these three diseases existed?—Certainly.

2460. You would prohibit the importation of cattle from Germany as long as pleuro-pneumonia existed?—Yes.

2461. But during that prohibition you would claim free export of your own cattle?—Exactly. If we have no disease in this country, no other country has a right to say that we are dangerous to them.

2462. How do you propose to arrive at freedom from disease in this country?—By stamping it out.

2463. Until you arrive at freedom from disease in this country, you cannot expect foreign countries to take your cattle?—No; we are at the present time importing cattle from all parts of the world, and all the world is shut against us; and that is what is called free trade.

Friday, 8th June 1877.

MEMBERS PRESENT:

Mr. Anderson.
Mr. Assheton.
Mr. Jacob Bright.
Mr. Cameron of Lochiel.
Mr. Chaplin.
Mr. James Corry.
Mr. Wilbraham Egerton.
Mr. Elliot.
Mr. W. E. Forster.
Mr. John Holms.
Colonel Kingscote.
Mr. Murphy.
Sir Rainald Knightley.
Mr. M'Lagan.
Mr. Norwood.
Mr. Pease.
Mr. Arthur Peel.
Sir Henry Selwin-Ibbetson.
Mr. Torr.

SIR HENRY SELWIN-IBBETSON, IN THE CHAIR.

The BARON FR. VON BEHR, called in; and Examined.

Chairman.

2464. YOU are a large Landed Proprietor in Germany, I believe?—I am.

2465. Have you come over to this country in consequence of the discussion that has taken place, and the Committee that is now sitting on the Cattle Plague?—I have.

2466. You represent to the Committee that the German farmers are largely interested in the question?—They are.

2467. And they are interested also in the protective measures that we, in this country, take with regard to the import of cattle?—If I may be allowed to express my views upon the subject, I would first bring before the Committee some statistics. I have here a newspaper showing how very great is the import of German cattle into your country; and how much money we gain by introducing our cattle and sheep into England.

2468. Will you give the figures to the Committee?—I am sorry to say that for the year 1876 I have not the numbers; I have them only until 1875. I have no reason to doubt that in 1876 the numbers will be rather higher than lower. In the year 1875 the export from Germany to England was over 67,000 head of cattle.

2469. Do you include cattle from Schleswig-Holstein in that number?—I do. I know that I might mention it separately, but I felt myself entitled to include it. We sent over 340,000 head of sheep. Our 67,000 head of cattle brought us in nearly a million and a half of guineas. In the last five years, including 1875, we received 206,000,000 marks for our cattle and sheep from England. That is rather a great sum for us. Then there is another thing still more important with regard to that. When the cattle-dealer inspects my flock of wethers he calculates as follows:—Well, of these 100 about 30 are good enough for London market, and will give me a high price, about 40 will go to France, the rest remains in the country. If he knows that for those 30 of them he will get paid very highly in England, then of course he can buy the whole, at a good price; if not, not. So that it is of the

Chairman—continued.

greatest importance to have free entrance for our cattle and sheep into England. I ask permission to read a very few lines from a book which appeared two years ago, which was published by the Cobden Club. I have a notion that the name of the Chevalier de Bunsen is still very well known in England, it is his son, who is not interested in any way in this matter, except as a member of the German Parliament, who, not knowing what would happen, wrote, two years ago, something which, if the Committee will allow me, I will read: "As for the Chancellor of the German Empire, you are aware, gentlemen, that with him the love of Free Trade is not an acquired taste, for the landed gentry of Prussia are essentially Free Traders." G. von Bunsen continues: "Will you pardon me, however, if, at the close of this far too lengthy epistle, I try to explain why, at its beginning, I qualified my statement by saying that I could apprehend no serious or lasting retrogression. Notice should, I believe, be taken of two complaints of the landed gentry of Prussia, to whom I have just referred as being natural allies of the Cobden Club. They have a grievance of old standing against English legislation, and a new one; both are affecting their purses seriously; a cry for reprisals is beginning to be listened to more readily by them every year, and I am bound to confess that a temporary backsliding on the road of Free Trade in the German Parliament, by a combination of this and some manufacturing interests, may be the result. Of course I am speaking of the manner in which English revenue is raised on spirits, and of certain measures caused by the advent of rinderpest. It has been said, and said with truth, that the conclusions which led to the preservation of the former, and to the introduction of the latter, had nothing whatever to do with protection; and I am unable to judge whether or not protection of the English distiller in the one case, and of the English cattle breeder in the other, is indeed the effect of those measures. If, however, they should, on renewed

Baron *Fr. von Behr.*

8 June 1877.

Chairman—continued.

examination, be found to have that effect, who would doubt the efficacy of that wise and sound principle which the late Mr. Cobden rendered dominant in the councils of Great Britain, to wipe out from her statute book obnoxious excrescences which weaken the hands of well-wishers and Free Traders abroad." I wish to show that if I represent to-day that any restriction in the cattle trade would be felt to press very hardly upon German farmers, it is not a dream of to-day only, but this is an old feeling of ours.

2470. You represent, then, that the German farmers look with great anxiety to any restrictions on the export of cattle from Germany to this country?—Certainly.

2471. You also state to the Committee that you believe that it would not only affect the actual trade which you have with this country, but that, in the way which you have described, it would affect your trade with France also, because you have spoken of the butchers coming to select the cattle from your herd, and buying for the French market as well as for the English market?—Yes, our herds pay better if the butchers can send the best to England, because the average price is higher in England.

2472. You have heard, of course, of this new idea of a dead-meat trade?—I have.

2473. Have you considered, with regard to your German farmers, whether they would go into a dead-meat trade?—We have been thinking about that for several years. I know by my newspapers, that the whole import of dead-meat to Great Britain in the first three months of this year was about 500,000 hundred weight, the value being 1,250,000 *l.* sterling. From this the United States sent 360,000 hundred weight the value being about 1,000,000 *l.* sterling; but I do not know whether the United States have any profit from it; I should hardly believe it. As the "Times" from yesterday tells me, you had a witness the day before yesterday who told you that the profit was doubtful. I cannot but imagine that preparing a ship with a sort of arctic saloon in it must be most costly, and the smallest hole into such a saloon would spoil the whole cargo. Then, again, the transport, on this side, from the ship to town would be very costly. If I am correctly informed about that. American meat, about 30 per cent., on an average, has to be thrown away; a great deal is sold at half-price, and only about 30 per cent. pays really what it costs in America. Now, I know that as Americans have millions of acres of best grass-land in the far west, costing 1 *s.* an acre, they can breed cattle very cheaply, which we cannot do in our country, and which you cannot do here.

2474. Can you tell the Committee what is the wholesale price of cattle in your country, comparing it with the prices which are given for the American cattle before they are sent over?—It differs very much according to the time of the year, and whether the cattle are very fat, and so on. There can be no accurate comparison, but certainly we cannot sell the meat so cheaply as the Americans can.

2475. Then you represent to the Committee that, looking at the cost of your cattle before you kill it, if you add to that cost the outlay which is employed in these new ice chambers, and the freight of the dead meat, it would make the trade so unremunerative that your farmers would not go into it; is that what you wish to say?—I do not only wish to say that but to prove it, and I have good proof of it; if it were possible to bring it over from Germany, why should we not have done it already? The late Mr Williams, the Secretary of the Veterinary Department here, said at Vienna, that it made a difference of 2 *l.* whether we send a head of cattle to Deptford or to London; if we could profitably have sent the meat directly to London, should we not have done so? Why should we have sent cattle to Deptford? I think that is a good proof, but I can get another. What should we do with the offal? I was very much astonished to read in the newspapers that Professor Brown declared here the possibility that offal, which would supply food for the poor, might come from Vienna and Hamburg packed in ice. I inquired what was sent from Vienna, and I found that it was salted intestines. I do not think that that will be of very great value here as food for the poor.

2476. What you would tell the Committee is that, looking to Professor Brown's statement, you do not believe that it is entirely borne out by what really takes place as to the export of offal from Vienna?—Offal fit to be eaten by the poor could not be sent.

2477. Some offal does come, but you say that it is not that which goes into the market for consumption?—Quite so; in Russia, near our boundaries, cattle are very cheap; and nothing would seem to be more easy than to have a great slaughtering-house close to our boundaries, and have all these Russian cattle which are not allowed to come in, slaughtered at the boundaries, and sent to Berlin in ice; nothing seemed more plain and clear; but after examining the thing it proved to be impossible.

2478. You state that it has been tried with regard to your home consumption, and has not been adopted from its not proving successful?—In Prussia it has not been tried, but it has been much spoken about. I am told that in Austria it has been tried and failed, and that the result has been bankruptcy; but in Berlin I myself, and several other gentlemen, spoke very much about it some years ago when the meat was so very dear, and consulted as to whether we could not bring the meat of these prohibited Russian cattle in ice to Berlin; but every reasonable man in Berlin said, "It is not possible, you would lose an immense deal of money."

2479. But you have not tried it in Prussia?—We have not tried it in Prussia.

2480. You stated, I think, that it had been tried in Austria?—I am told that it has been tried in Austria; but I cannot speak from knowledge as to that.

2481. Are the farmers in Germany satisfied with the existing regulations of your Government as against cattle plague?—I do not know how it is here, but I daresay farmers are seldom quite satisfied with Government measures. In this case they were. When one looks along the boundaries from Tilsit and Memel down to Cracow and Upper Silesia, I have a notion that that is more than 1,000 English miles of boundary to be protected, and we had the conviction that our Government did all that they could honestly do. It paid the whole value of the slaughtered cattle in every case where the rinderpest broke out, and it sent also the best man, the president

Chairman—continued.

president of the province, like a Roman dictator to the spot, and the disease was stamped out. In 1873, when the cattle plague broke out in Upper Silesia, which is a very difficult country to deal with because it is inhabited by 100,000 small farmers near the boundaries, every one of whom has his cow, it was rather a difficult case; but in 10 days all had been stamped out, and nothing more went over the boundaries of that country.

2482. From the evidence that was given us by Professor Müller the other day, it appears that the German Government are intending to make their restrictions more severe?—They are. I hope that the whole of Europe will have learned very much from this last case, and I hope we shall all learn together. From what Professor Brown said before this Committee, I think that every country has something to learn by what has happened.

2483. Are you aware of the measures that are proposed to be taken?—I know them perfectly well. I shall do my best in the German Parliament to make them still more severe; and, if I shall not be trespassing too far upon your kind indulgence, I will take the liberty of saying what I have dreamed might be done by England, because I am decidedly of opinion that the great work to be done is to provide additional securities, and it must be done *viribus unitis*; there must be a *union indivisible* between Germany, England, Holland, France, and Belgium, because in this matter you cannot separate the interest of one country from that of another; you cannot put it as a cattle question and a sheep question, and I do not know what other question, but it is all a *union indivisible*; if you prohibit the cattle and allow the sheep, the sheep may bring you the disease, and if you prohibit the sheep, the goats and other ruminant animals may bring it to you.

2484. Then what you would say to the Committee is, that you look for the suppression of these diseases throughout the countries generally of Europe, to restrictive measures rather than to prohibitive measures as against the import?—I would first beg permission to say that we have ourselves a very great interest in stamping it out everywhere. It is not only for our foreign trade, but it is of the first importance to ourselves that we should do our very best, and that we should examine now how measures can be made more severe still. For instance, it is already fixed with us that within about 50 English miles from the dangerous boundaries of Russia no head of cattle may come to a railway station in order to be transported.

2485. Are you quite positive about the 50 miles, because Professor Müller stated in his evidence that it was a zone of about 25 miles in width?—Professor Müller is wrong then. We have first a very stringent rule, that only beyond 10 German miles, or 50 English miles, from the menaced boundary, the cattle may be brought to the station. But we have something more. Professor Müller probably intended to say that five German miles, that is to say 25 English miles, from the boundaries no cattle are allowed to leave their stables without permission.

2486. He stated that the zone applied to a district in which the cattle were all registered, and could only be moved by permission from the head man of the district?—So it is.

2487. And that no cattle were allowed to be placed upon a railway truck, excepting at certain points which were in the interior of the zone?—Yes, with the certificate not of a veterinarian but of the sheriff of the county, and under the inspection of a veterinarian at the station itself.

2488. That applies to the whole of your Prussian boundary proper, does it not?—Whenever danger might be possible.

2489. Does it exist with regard to the Austrian frontier?—I do not think. If you look at the map, Prussia is more interested in Russia than in Austria in this respect.

2490. Will you tell the Committee, first, if you please, what you think that your own country ought to do for your own protection and in your own interest?—The Government did all that was possible to awaken general attention upon the subject; and I consider it a very great advantage that public attention has been called to it in England, because we must study this affair altogether; we must endeavour in every possible way to protect the farmer, not by impossible prohibitions but by possible ways, as I told you. Within 50 miles from the boundaries the cattle are not allowed to come to the railways; and within 25 miles no cow out of a village or a farm can be moved without permission. I am glad to say that every county with us has a royal veterinarian fixed in it; but besides that, we have what I may call flying veterinarians, or travelling inspectors having no fixed post of duty, but who are obliged to go day and night through the whole country. Then we have given the order that on the occurrence of the first doubtful case (what happened this time shall not happen again, that is to say, that the disease reached you before you had been warned by us); every county authority will be directed to despatch the intelligence of an outbreak of disease immediately to England.

2491. You propose now that the man who first sees the outbreak shall telegraph instead of waiting for the department to telegraph on information received from the local authority?—So it is. It will not go through the different departments but directly, as soon as possible. Then another great measure that is proposed now is that we have made, I may say, something like a mobilising plan. The county authorities order that as soon as any suspicious case happens, no cattle in the whole district may be brought back from a market, but that they must be slaughtered there.

2492. We understood Professor Müller to say that for the future, on the first outbreak of cattle plague, the market at Hamburg, the market at Breslau, the market at Berlin, and the market at Dresden, would all be closed; will that be so?—I daresay that will be so. I do not say that it will be so with regard to Baden and Wurtemberg, which are not on the road for export; but this is quite a new regulation, and that would be a matter to be arranged betwixt your Government and ours. If you desire to have shut up still more markets, perhaps that might be done; but I know that it can only happen near the Russian boundary, and all markets for some hundreds of miles along the boundary will be arranged in such a way that no cattle can be brought alive from the market.

2493. And therefore there will be the protection of telegraphic communication the moment that the disease breaks out, and also that almost

Baron *Fr. von Behr.*

8 June 1877.

Baron *Fr. von Behr.*

8 June 1877.

Chairman—continued.

at the same moment the export will be stopped, because the markets will be closed?—That will be so. That I call the mobilising plan, because it does not require any large conferences, but it is done immediately. Local authorities will have a right to do it without asking the permission of the Ministry.

2494. That would not only be a protection for yourselves, but you represent that it would be a protection for England and other countries?—The only difference that I can see betwixt England and the other countries is, that you are in a much better position than every other neighbour of ours. You have three points from which cattle come to you out of Germany. France has, I do not know how many dozen railway lines, Belgium equally, Holland equally, and Switzerland equally; England is in by far the best position.

2495. Do you represent that the cattle plague is stamped out in Germany at the present moment?—I am quite convinced of it, and I may state that all our neighbours, with the exception of England, are of that conviction, and have reopened their boundaries. I was very much astonished to read yesterday in the "Times" that the Dutch Consul said here that Holland did not open her boundaries. He may be right as he is an official man, but I doubt it, and if I find, when I return home, that he is wrong, I shall take the liberty of writing from Berlin about it. I think that there may be a mistake. We have something like a little pleuro-pneumonia war with Holland, and I think it will depend upon that. All our other neighbours opened their boundaries.

12496. What I understood Mr. May, the Consul General of the Netherlands, to state was, that they had prohibited the introduction of cattle since 1872?—Yes, I daresay that is what I call the pleuro-pneumonia war.

2497. And that at present, although they allowed sheep that were in transit to go through their country, they did not admit of any cattle being introduced into it?—That speaks for me. Those measures in Holland have not been taken on account of the cattle plague, but have been in practice for years past, and the reason of that is probably what I told you, viz., the pleuro-pneumonia war.

2498. Will you state what further measures, besides those which we have been told of, you think right to be taken, both for your own protection and for the protection of your export trade?—What I have to state is an old claim of mine. I have studied this affair since the Vienna International Congress, five years ago.

2499. That was the conference at which it was attempted, was it not, to bring about an arrangement by which telegraphic communication of these outbreaks was to be made?—The conference agreed to a great number of different proposals, but I am sorry to state that very little has been done yet, not by the fault of Germany, but, to tell the truth, it is for the greatest part on account of Russia, which did not protect us against cattle plague. Since that time I have endeavoured in my country to obtain more severe measures. I am of opinion that if the punishment is not sufficiently severe to frighten the smugglers, it will have no influence.

2500. Your punishment is tolerably severe now, is it not?—It is not severe enough for me; I would have it much more severe.

Chairman—continued.

2501. Professor Müller stated that, in case the smugglers refused to answer the challenge of the sentry they were shot, and that if taken, they were imprisoned for three years?—If he told such an anecdote as that about a person being shot, I must give the correct version of it. There was a village in which the cattle plague existed, and it was forbidden to come out of it, a poor man came out, and the soldier called on him, and he did not answer, then the soldier shot at him, and he was killed; but afterwards it was discovered that the poor fellow was a deaf-mute.

2502. But, if that is the case, you have already very strong measures taken?—I wish much stronger measures to be taken, because as long as smugglers bring an animal over by night for gaining a few dollars, what misfortunes can they bring over the whole of Europe! Philosophers may think otherwise about that; but I, as a practical man, think it should be an eye for an eye and a tooth for a tooth about it. If a man to gain a few dollars brings such an immense danger on the country he must be punished very severely. I find that it is forbidden in your clubs to give any money to the servants, because they are to do their duty without extra paying; we have the same theory on our boundaries; so we say that the policemen must do their duty likewise without gratification. But I am of the contrary opinion, I would pay those who denounce a smuggler a good deal of money. If a man brings an animal over the boundary against the law, and gains by it 10 dollars, his neighbour will denounce him if he is sure to win 20 dollars by denouncing him. I shall do my very best to have the smugglers punished in every way.

2503. Do you think that your country would probably strengthen the already strong measures that are taken against the smuggling of cattle?—I do not know what influence the farmers have in England, but we farmers have some influence in our Parliament; we shall do our best, because if England prohibits the import for half a year or more it will cost us a good deal of money, and, perhaps, all because such a man has brought over a cow by night. I think Professor Müller is wrong about the three years' imprisonment; as much as I know, law says: that him who "knowingly" smuggles will be punished by prison up to one year. If, in consequence of his smuggling, other cattle get diseased, imprisonment takes place from one month to two years.

2504. The word "knowingly," then, is in the law of Germany as well as in that of England?—Yes.

2505. Are there any other restrictions that you might enforce?—I should wish that Prince Bismark himself, the Chancellor, should issue the instructions about the cattle plague measures; I wish that they should be given by the highest authority of the empire, in order to show the lowest employés that there is no joke about it, and that in carrying out a measure of such immense importance they must all do their very best.

2506. Would you make those instructions applicable to the whole German Empire, and therefore to the whole cattle disease importing frontier, or would they be only applicable to Prussia?—All measures concerning the cattle plague are not under the law of Prussia, but under the law of the empire.

2507. That is what I asked before with regard to

Chairman—continued.

to the zone or boundary of the district; whether that applied as an imperial instruction to the whole empire?—Not yet; that is in Prussia; other German States have not boundaries towards Russia.

2508. But do not a great number of cattle come over the Austrian frontier that are equally liable to bring in cattle plague?—I do not interest myself in those measures as to Austria; but, so far as I know, there are very severe restrictions also there; I believe they must prove that the cattle have been a certain number of days in Austria, but it is very different in Austria; Bohemia is very strict about it, but some other provinces are, perhaps, not so strict.

2509. Of course the danger to England is a danger existing from the importation of cattle generally from Germany, and not only from Prussia; and, therefore, if the restrictions made by Prussia to protect England are not adopted by Austria, we are still liable to danger from that country?—It could not pass through Germany; if it could come by the Adriatic it might get to England from Austria.

2510. But I mean from these grey and other cattle which are supposed to be liable to the infection?—I am not so specially instructed about Austrian things; but I say that, as we have all the very same interest to provide additional securities, if the English Government would say to Germany, "Now we desire you to do this, and this, and this, and this, and this," we should, of course, most willingly do it.

2511. You think that any reasonable regulations guaranteeing England with regard to your frontier would be willingly adopted by Germany?—Yes. As I have already said, this thing is not to be dealt with in the interest of one country alone, but all those countries are in one *union indivisible*.

2512. Will you state to the Committee in what way you think we can strengthen your hands by our regulations?—With the greatest pleasure. This, to tell the whole truth, rather gave me more desire to appear here before this Committee. Take this dreadful case in Hamburg, which brought over to you the cattle plague; why could you not set an Englishman by the side of the Hamburgian or Prussian veterinarian? How many ports in Germany export cattle to England?—There are only Tonning and Hamburg and Gestermunde, and perhaps one or two others.

2513. What you mean to represent is that England ought to maintain at the different export places a veterinary staff, so as to satisfy themselves by inspection there that the cattle were free from disease before they came over?—Yes; but between nations like us the veterinarian could have no veto; he could not say "I do not allow these cattle to be sent," but he could say to his German fellow-veterinarian: "My dear friend, if you bring those cattle to the ship, I will telegraph immediately to England, and when they arrive there they will not let them in." What would it cost you?—If you gave such a man, in each of the three ports, about 300 *l.* a year, he could inspect every ship, and give you every security that you want to have; but, of course, he could not prohibit the embarkation.

2514. Do you think that the examination by a veterinary inspector at the port of embarkation would be an absolute protection to this country?—I think it is not possible to doubt that it would greatly augment your security if there is an English veterinarian looking after every ship and examining every head of cattle.

2515. In the case of the last outbreak of the cattle plague, which was introduced here from Altona or from Hamburg, the cattle were inspected before they started by a veterinary officer at Hamburg, and they came over here being declared not to have the cattle plague; they started, and yet, when they arrived here, one of them died as it was being landed, from the plague having broken out on the voyage; in that case the veterinary inspection was no protection?—That case was a very grave one. I am glad that I was not a juror to judge the veterinary who inspected the cattle. Either he did not inspect them, or it was impossible to see the disease; but in any case, if your Government had a man there, who, of course, would be a person in whom your Government had entire confidence, because you would not send another man, you would be convinced that nothing more could be done.

2516. That, at all events, you represent would be great additional protection?—I think that it must be.

2517. Is that the only suggestion that you would make with regard to England?—My general feeling is that not only England, but France, and Belgium, and Holland, and Switzerland are all in the same danger, and that we must all do our very best to discover what securities we can make out to protect ourselves against this dreadful disease. Perhaps England might ask us that the law as to the cleansing of the ships should be an imperial law with us; until now it has not been an imperial law, but it is the law of Hamburg, and Oldenburg, and Prussia.

2518. You would make the law of disinfecting ships a general imperial law applicable to all the country?—Yes.

2519. That is what you would recommend with regard to cattle plague?—Yes.

2520. Have you much pleuro-pneumonia in your country?—I hope not so much as you have.

2521. But still pleuro-pneumonia exists in Germany, does it not?—Yes.

2522. Do you consider that to be nearly as dangerous a disease as cattle plague?—By no means; there is nothing like cattle plague.

2523. Do you slaughter the animals in the case of pleuro-pneumonia?—We have new laws about that; and I am convinced that my country would be most willing to enter into any arrangement with regard to that which may be proposed. You, probably, know better than I do that Switzerland proposed an international arrangement against pleuro-pneumonia; and I think it most likely that, after this great outbreak of cattle plague, and this great fright to Europe, all countries will be more ready still to enter into that idea of Switzerland.

2524. The malady of pleuro-pneumonia remains for a very long time in the animal before it is discovered, does it not?—It does.

2525. Therefore the inspection, although it may be good as far as cattle plague is concerned, is not very protective as against pleuro-pneumonia?—Yes; but we would do, at least, what we can do.

2526. But if we proposed to deal with pleuro-

Baron *Fr. von Behr.*
8 June 1877.

Chairman—continued.

pneumonia with a view to stamping it out in England, you would have to consider not only the cattle plague regulations of Germany, but their pleuro-pneumonia regulations also?—Yes.

2527. Do you adopt measures with regard to pleuro-pneumonia in Germany with a view of stamping it out?—Yes; for we pay regularly for every case.

2528. Do you believe that you are gradually getting rid of pleuro-pneumonia out of the country?—This law has only existed for about a year; but I have the notion that if farmers get regularly paid for their diseased animals they have no reason to hide the disease; and if there is no reason to hide it, it will be stamped out. But many professors have different views; some pretend that an animal can live for years with a slight pleuro-pneumonia in the body.

2529. With the seeds of the disease in the animal?—Yes. If the animal is highly fed, then the disease comes out very quickly, but not otherwise.

2530. I believe Professor Müller stated that, with regard to the other infectious disease, viz., foot-and-mouth disease, you almost always have it in Germany?—I see in the official report of your Veterinary Department something about that. I was sorry to read that I do not know how many thousand sheep which came over from Hamburg were written down as being ill, but I understand that that was not the real foot-and-mouth disease. I have been told that Mr. Booth has been saying in this Committee that the foot-and-mouth disease was so very dangerous, that he lost, I do not know how many highly-prized shorthorns from it. That must be quite a different disease from the one which we have, because with us it is generally so very little dangerous that we do not care about it. I have had many times the foot-and-mouth disease among my cattle, but I have never lost one cow with it.

2531. Therefore you do not look upon foot-and-mouth disease with the same alarm as you do upon the other diseases?—Not a bit. If our herds are suffering from it, all that we do is to give them a little meal and water instead of fodder; by high feeding it may be more dangerously developed, but I am not aware of it.

2532. We understood Professor Müller to say that it is almost impossible to get rid of foot-and-mouth disease in Germany from the fact of its being constantly brought across from your frontier by the swine from Hungaria?—I am not informed about that.

2533. So that in what you state to the Committee to-day you wish to deal principally with the cattle plague?—We farmers in Germany only think of cattle plague, because that is a dreadful plague for us altogether; all other diseases are like children's illnesses compared with that.

2534. And you represent the feeling of the farmers in Germany as being very strong in favour of the continuance of the export trade from that country, protecting both Germany and the countries to which you export by more severe regulations?—I may take the liberty of expressing the wish of my colleagues the German farmers, that England, being the last of all our neighbours who until now has had her boundaries closed against us, will open them as soon as possible, as all our other neighbours have done.

2535. Is there anything else that you would wish to put before the Committee?—I have only to apologise for any errors that I may have committed.

Chairman—continued.

Mr. *W. E. Forster.*

2536. You are yourself a large cattle owner are you not?—Yes, if you call it large; I do not know what you call large.

2537. Are you one of those German gentlemen who buy costly cattle?—I had once a good some English shorthorns, and Lincoln rams, and so on; many English rams come over with foot disease, but we do not care for these things. We buy a great many English cattle every year.

2538. Notwithstanding that you give what are considered in Germany large prices for shorthorned cattle, you are not much impressed with the danger of the foot-and-mouth disease?—Not at all.

2539. You have an Agricultural Society in Germany, have you not?—Yes; that society has sent me over to give evidence before this Committee.

2540. Is that a society for all Prussia, or for Pomerania only?—That is for all Germany; all over Germany there is not a country which has not a little agricultural society. These little provincial societies combine, and they elect members for the provinces, and the heads of those provincial societies elect members for the central society; that central body is the Deutscher Landwirthschaftsrath; and having read in the journal called the "Field" the evidence that has been given before you, for instance by a Danish farmer, the German farmers immediately sent me over as a witness.

2541. What is the distance of your own estate from the Russian frontier?—I am happy to state that it is very far.

Mr. *Assheton.*

2542. I suppose you do not like having the foot-and-mouth disease in your stock?—I do not like it, but I do not care much about it; we cannot prevent it; it comes and it goes, and it does not matter.

2543. Have you ever at all estimated in your own mind what value it takes out of a beast; how much less in value a beast was from having foot-and-mouth disease?—I have had it several times in my herds, and three or four fat cows were so ill that they could not eat; then they got the meal and the water, and I did not give my children the fresh milk, but I cooked it; then after a week or so all was forgotten. It may be that here, where there is high feeding, and it may be that in parts of Saxony where they have high feeding too, that illness is dangerous; but with us, where we have healthy cattle going over the fields the whole summer, the disease comes and goes, and we do not mind it.

2544. Do you not think that it injures a fat cow to have the foot-and-mouth disease?—Yes; it may be so with high feeding, but my herd have never been so fat as to suffer earnestly from it.

2545. Do you, as a farmer, complain of these regulations with regard to cattle plague?—We think that, if necessary, we ought to submit to them. The officials, who are like despots, are sent to stamp it out, and we obey them because we know that we must obey.

2546. You told us about all these regulations respecting Russian and Austrian cattle; should you, as a farmer, like to see those regulations done

Mr. *Assheton*—continued.

done away with?—Not the least in the world. Do not think that we do all this for you, else it would be badly done. We do it for ourselves; egotism is the first principle in life, I am afraid to state.

Mr. *Wilbraham Egerton.*

2547. Do you think you can persuade your Government to carry out the suggestions which you have made in order to prevent cattle plague from being introduced into your country?—I think that by carrying out the two suggestions tat I have made, of severer punishments and extra pay for these detectives, we may put down smuggling, and I hope that we shall do it. For some years to come they will be so frightened that they will take care not to smuggle.

2548. As I understand you, you will not do that in order to do us any good, but you will do it for your own protection?—Yes.

2549. Then why have you not done it before?—Until now we were entitled to believe that our laws were sufficient. In the year 1873, we had an outbreak and it was stamped out immediately.

2550. But you have been always subject to the importation of cattle plague from Russia, and you are aware that cattle plague is a very great danger to your animals; why are you likely to do it now, when you have not done it for years past?—If no mischief occurs, then you might think that the rules are answering; but if such a case happens as happened now, and we see that the law is not sufficient, then it is time to mend it. We do not mend it if it is not necessary.

2551. Then your point is, that your farmers, acting upon the Government, will make their alarm at the introduction of the cattle plague felt by the Government now, although they have not done it before?—It has not hurt us until now.

2552. You suggest that an English veterinary surgeon should be appointed at the ports; is that for your benefit, to enable your exporters to send their animals in a sound state to England?—My opinion is, that we shall most willingly do all that our neighbours desire us to do, to give them the certainty of being well protected. If, to-morrow, Switzerland were to come to us and say, "Could you not do this?" and Belgium and Holland were to say, "Could you not do that" I think we should, with the greatest sincerity, do our utmost to do it. England is in such a happy position that there are only half-a-dozen ports from which cattle can be brought over; and I have a notion that what I propose would give you the idea of great security.

2553. But that would be transferring to us the responsibility of the importation of the disease into England?—Not at all, because the same German veterinarian must be there, and must inspect the cattle as until now, and your countryman would have no right at all except to say to the German veterinarian: "My dear fellow, take care." That is all that he could do; but I think that it would give you security to know there is a man of your country who knows that his country has an enormous fear of the disease, and that he must do his very best to detect it.

2554. You think that your Government would be willing to have an English veterinary officer at the German ports?—I think they would not object. If the Texan disease came over to England that the newspapers speak so much of, would

Mr. *Wilbraham Egerton*—continued.

you think it against your honour and dignity if a German veterinarian stood in an English port to look at the cattle without any right to order, but only to inspect?

2555. I rather misunderstood you. I thought you would give the English veterinary surgeon some power?—No, I stated that he should have no power.

Mr. *Elliot.*

2556. Did I correctly understand you to say that the best cattle in Germany are chosen to be sent to England, and that the inferior ones go to France and elsewhere?—The best sheep.

2557. Not the best cattle?—I do not feel myself quite informed, but I dare say it is the case. If I fatten my wethers and sheep, and sell them to the man, then the man who buys them makes this calculation for himself: "I can give, say, 30*s.* a head, because I know a good many of them I can sell for 50*s.* in England." You pay here in clubs and houses 10*d.* a pound for your meat. That is such an enormous price, that it is worth the trouble to bring over the very best cattle. If among my 100 cattle some are sold at a high price, that gives a better average price.

2558. You said, I think, that the farmers in Germany would feel very much the stoppage of the exportation of live cattle?—Yes, very much. If such a quantity of cattle is not brought to England, and does not fetch these high prices, of course it brings down the whole price.

2559. Are you aware that the farmers in England are now very much hampered, and put to very great expense by the importation of cattle plague by means of German cattle?—I am of opinion, that when they get paid regularly, for slaughtered cattle they do not suffer more than we do. Your cattle is dearer, but your purse is much longer.

2560. You are aware that the cattle plague was introduced into England from Germany?—Do not be too severe upon my country. Germany does not breed cattle plague; it comes from Russia, and we have the very expensive and difficult mission to protect the whole of Europe against cattle plague from Russia.

2561. The last outbreak of rinderpest in this country came from Hamburg, did it not?—So the newspapers say.

2562. I suppose you agree with me that we ought to look after our own interest in this country?—Certainly, just as we shall do.

Mr. *John Holmes.*

2563. I think you stated that you do not care very much about pleuro-pneumonia or foot-and-mouth disease, but that you regard them as children's diseases?—Pleuro-pneumonia is a dreadful disease; but I say that I do not know how to stamp it out.

2564. But you regard the cattle plague as the important disease, and so important, that you, in your country, always stamp it out?—Yes, as soon as possible.

2565. If you would stamp it out, I suppose you would not allow cattle suffering from it to reach any port?—No.

2566. If that be so, what additional safeguard will it be to us, as a country, to have the advantage, which you kindly say we might have, of having an English veterinary surgeon at each of those ports?—Because errors are possible all through

Baron *Fr. von Behr.*

8 June 1877.

Mr. *John Holmes*—continued.

life; two veterinarians are better than one, and four eyes are better than two to look for the right.

2567. But if you protect yourselves by stamping out the disease, and not allowing cattle to come to ports, and then have your own inspectors at the ports, it would appear to me that upon the whole we run very little risk now of importing cattle plague from your country?—My meaning was to give yourselves the persuasion that everything was being done that one might fancy necessary to protect you against this dreadful disease; and I thought it would give you more confidence if not only a Prussian, or a Hamburgian veterinarian stood there, but by the side of him an English one.

2568. You think that it would be an advantage?—It would be an advantage for you, not for us.

Mr. *Anderson.*

2569. Do you consider that pleuro-pneumonia is a disease which has been imported into Germany, or that it is is indigenous?—That is a difficult thing to answer; I think that if you asked 12 professors, six would say one thing, and six would say another.

2570. Do you consider that foot-and-mouth disease is an imported or an indigenous disease in Germany?—I did not study the question. A friend of mine, Mr. Witte, who has been sent over with me, knows that better than I do. We have some slight foot disease which our sheep get when they have wet feet for weeks.

2571. That is what we call rot?—I daresay; Yes.

2572. You spoke of your cows having foot-and-mouth disease, and you said that you did not give the milk to your children then; do the cows lose their milk then?—During those days when they do not eat they give little milk.

2573. But does the milk come back to them afterwards?—Yes; it is just like a cold wind that comes over a flock for a week or so. We do not care for foot-and-mouth disease. Pleuro-pneumonia is a dreadful disease; but until now we have not known how to get rid of it entirely because it is in every country; it is in Holland, in England, and in some parts of Germany.

2574. When suffering from foot-and-mouth disease, do the cows ever cast their calves?—All that, again, I daresay, happens more with highly-fed cattle, and not so much with ours; but this again is a question which my countryman, Mr. Witte, who has a large shorthorn herd, would be able to answer. He has for a many years bought shorthorns, and feeds them highly, and he will know that.

2575. You spoke about the impossibility of importing dead meat into this country on account of the price; can you tell us what is the average price of dead meat in Germany?—That is a very difficult question to answer. It depends upon the quality; it depends upon who buys the meat, and it depends upon the time of the year.

2576. You cannot give even an average?—Generally speaking, the butcher is paid seven pence for the best pieces per pound.

2577. That is the retail price, but I want the wholesale price?—That is difficult to give, because the variation it very great. In the sugar fabrics they have high feeding, and there it is dear.

Colonel *Kingscote.*

2578. May I ask you whether you breed your cattle, or whether you buy them?—We buy some from Schleswig-Holstein, some we breed ourselves, and some we buy in England.

2579. Can you import either cattle or sheep from England at the present time?—I think we should rather protect ourselves, because you have much more disease now than we have; but I do not know whether we can import now.

2580. It is prohibited, is it not?—I really cannot remember.

2581. If there was a total prohibition which lasted for some time, it would be a great loss to you, would it not?—It would be rather a loss to us.

2582. Because you would not be able to get some of your best animals over?—That is so.

2583. You think that crossing with English stock improves the breed of your cattle in Germany?—No doubt.

2584. You think they will produce more meat when crossed with our cattle, and therefore you would consider it a loss to your country if the importation of English cattle to Germany was stopped for a long period?—Yes, it would be a loss, but not a tenth part of the loss that we should have if export to England were forbidden.

2585. With regard to foot-and-mouth disease, are you not aware that foot-and-mouth disease attacks cattle that are poor almost worse than it does those that are fat?—I have a notion that it acts more hardly upon highly-fed cattle than upon poorly living ones.

2586. Have you never lost any calves by it?—I cannot remember; but the disease is not so bad with us, though here it may be much heavier.

2587. You repeat that you do not think much of it?—We do not.

Mr. *Arthur Peel.*

2588. Would there be any difficulty in the way of procuring ice, in introducing a dead-meat trade from Germany?—Our winters are cold enough, and we could collect ice; but it would not pay to transport the meat in ice; and ice is not the only thing that would be requisite.

2589. Would it be possible to send a whole beast over, offal and all, in ice?—It would be quite impossible to pack the carcase in ice in such a way as to preserve the meat and keep it fit for eating. If it had been possible, why should we not have done it before, to avoid that great loss which we had to incur by having to kill and sell at the market at Deptford? We lost 2 *l.* upon every beast.

2590. But the trade is only a new trade, and you have not gained experience yet in the dead-meat trade; are you aware that there is an experiment now being tried to introduce dead meat from Vienna to this country?—I do not know it; but I am sure that it will not pay.

2591. You do not agree with the Prussian gentleman, who was a Professor of the Veterinary College, that no matter what precautions you take in Germany, it would still be necessary to slaughter cattle at our port at Deptford?—I hope that the time will come when you yourselves will be persuaded that all is regulated so well that you can classify German cattle in the same schedule as French cattle and Spanish cattle.

Now

Mr. *Arthur Peel*—continued.

Now you class them with the Russian cattle; and I think that we should rather prefer to be classified with the Spanish and French.

Chairman.

2592. Germany is not at present classified as Russia is; at this moment, in consequence of the outbreak of cattle plague, cattle are prohibited; but it is not generally classified as Russia is?—Not in general; it was at the time when Mr. Williams made these declarations at Vienna.

Mr. *Arthur Peel.*

2593. You have made a very valuable suggestion about allowing English veterinary inspectors to reside at the German ports of departure; I suppose to give that gentleman's opinion any value he must have the cattle under his inspection for a certain number of days, and there must be a sort of quarantine established?—Whether it would be possible to keep them some days there I do not know, but I am very dubious about it; all I intended to say was, that when the German veterinarian stands there and inspects the cattle, it would give you a good deal of security to know that by the side of him is an Englishman who owes it to his country to do his very best to protect it and to give you the earliest intelligence of disease.

2594. He could not detect disease which was incubating in the animal, and therefore he would require to have the animal under his view for some days; do you think that that would be practicable?—I do not know; I should think that that depends upon how the ships go, and so on; I do not know whether the trade would admit of it, but I doubt it strongly.

2595. Do you think that the system of compensation which is adopted in Germany is sufficient to bring about the detection of disease?—Yes. In Germany, if a farmer has his cattle slaughtered, and if he gets paid, who pays it? The empire. I think that it would be wiser if only, let us say, a half of it, were paid by the empire and the other half by the province.

2596. Have you, in Germany, the practice which the Consul General for the Netherlands stated prevailed in his country, that where an animal is suspected of disease, and the owner of it declares it to the authority, the full value is paid; and that where a diseased animal only is notified, then only half the value is paid?—I think that that must be with regard to pleuro-pneumonia; for cattle plague they pay the whole.

2597. But you do not think that it would be a good plan to put a premium upon having suspected animals rather than diseased animals notified to the authorities. If you have the full value paid for a suspected animal, there would be an additional inducement to the owner of the animal to declare that the beast was diseased, would there not?—Surely it is a good principle never to ask anybody anything which is against his own interest, but you may ask him as much as you please, if you pay well for the truth.

Mr. *Chaplin.*

2598. I think I understand that you do not consider your present precautions on the frontier sufficient to guard you against the risk of cattle plague being imported by means of smuggling?—I took the liberty of stating that our foreign precautions already have been made much stricter, for instance:—No cow will be allowed to be removed from the owner's premises within 25 miles from the boundaries, or to be taken on a railway within 50 miles from the boundaries; but I think that more severe punishments might be inflicted in the event of the law being broken by smugglers.

Mr. *Chaplin*—continued.

2599. Supposing that you had all the precautions which you yourself desire, would that, in your opinion, make you absolutely safe against the risk of the importation of disease?—If you look at the boundaries you will see that they extend for more than 1,000 miles, and we do our very best for you and for ourselves; but who can say that it would not be possible for a man on a dark night to bring some heads of cattle across the boundary? If you look at that immense distance, you will see how difficult it is to protect the boundary. I proudly pretend that no other nation when in our geographical situation would be a better safeguard for Europe.

2600. You must always run some risk, whatever precautions you take?—Certainly.

2601. Consequently, if we were to import live cattle from Germany, we must run a share of the risk to which you are yourselves subject?—A very small share; the smallest share of all, because you have the sea all round you, and you have only three or four ports from which cattle are shipped to England, and you can protect yourselves by having a veterinarian in our ports, and also by having a veterinarian in your ports here. As I have told you, all our neighbours have removed the restriction which they thought themselves obliged to impose upon us when the outbreak came, except one country, and that was Switzerland. Why did not Switzerland take away the restrictions? Because it had taken none. And why had it taken none? When our Government wrote to Switzerland, saying, "Will you not take precautions? we have the rinderpest"; Switzerland answered us, "We know that Germany will do its very best, and that it will do so well that we need take no precautions at our boundaries." They have some dozen railways which can bring the cattle in from Germany to Switzerland, and you have only a few seaports, which you can easily protect. No country can protect itself so well as England can.

Chairman.

2602. Was that in 1873?—No, quite lately. That gave us satisfaction, and so I took the liberty of telling that little story here.

2603. The Committee are very much obliged to you for your interesting and valuable evidence?—I thank the Committee for hearing my evidence, and I only desire further to say that the German farmers wish for nothing better than to act with your farmers, and *viribus unitis*, to conquer this frightful disease.

Mr. Charles Lennox Peel, called in; and Examined.

Mr. *Peel.*

8 June 1877.

Chairman.

2604. You are the Clerk of the Council?—I am.

2604.* I believe that you are prepared to put in, on the part of the Privy Council, the orders of the Council since the outbreak of cattle plague this year?—Yes. (*The same were delivered in.*)

2605. Do you put in also a return of the local authorities who have made regulations under the permissive Order of the 13th February 1877?—Yes; 36 counties and 29 boroughs. (*The same was delivered in.*)

2606. Do you also put in a list of the local authorities who have made regulations against foot-and-mouth disease under the Order of the 5th of June 1876?—Yes; 42 counties in England and Wales, 20 in Scotland, 33 boroughs in England and Wales, and 5 burghs in Scotland. (*The same was delivered in.*)

2607. Those are all the papers which you are at present able to place before the Committee?—These are all that I can put in to-day. I shall be able to furnish the Committee with an analysis of some other papers.

Mr. *W. E. Forster.*

2608. Will you be able, in making that analysis, to draw a distinction between those counties that have stopped the markets and those that have merely prohibited the movement?—Yes; I have instructed a table to be prepared showing those that have altogether prohibited movement, those that have prohibited it except with license, and those that have prohibited or interfered with fairs and markets.

2609. Would you be good enough to put in a specimen order of each of those?—Yes.

2610. A similar Order to that was not issued by the Privy Council in 1873, I believe?—I think not; it was issued this year because we thought there might be a sudden outbreak, as it was beginning to spread, and that it would be better for the local authorities to be able to act at once without referring to us.

2611. The time to which these powers to act extend has not been limited, has it?—It is not limited.

Chairman.

2612. Will you put in the whole of the Orders?—Yes. We passed a very important Order limiting the number of ports at which foreign cattle could be landed, and that shall be included.

Mr. Murillo H. Gillett, called in; and Examined.

Mr. *Gillett.*

Chairman.

2613. I believe that your occupation may be at present described as an American Meat Exporter?—Yes.

2614. Were you formerly a cattle-breeder and feeder in America?—Yes.

2615. In what part of the United States?—Ohio.

2616. What was the length of your experience as a farmer there?—Thirty-one years.

2617. What was the extent of your farm there?—At one time it was 80 acres, and another time it was 1,460 acres, and at another time it was 3,200.

2618. What was the nature of your farming operations there?—It was principally the growing of cattle, sheep, and hogs.

2619. Can you give any details to the Committee of your mode of feeding or dealing with your cattle there?—Yes; we commence with our cattle in the fall, after they are two years old. In the month of October we usually commence feeding them with corn on the grass, and we feed them that winter what we call half-feeding, that is to say, we feed them with corn once a day, and with hay once a day, running on the grass as long as the grass lasts. When the grass gives out we feed them on corn once a day, and on hay twice a day, until the grass comes the next spring. The next spring they go on to the grass, and we carry them on the grass until October again. Then we commence feeding them on the grass, and feed them once a day with corn until the grass begins to weaken from the effects of the frost, and then we increase the feed and get them on to what we call full feed, that is to say, all the corn they will eat during the day. We feed them until the spring, February, March, or

Chairman—continued.

April, and when the market suits we consider the cattle fit for the market. They are then bought by operators in cattle, what we call middle men, or they are shipped by the farmers themselves to the sea-board cities, and sold on our markets there as they are sold on your London markets.

2620. Do you mean by "shipped" sent by railroad?—Yes, sent by railway.

2621. What number of head of cattle do you deal with on your own farm annually?—The number varies. If wool-growing is most profitable, we let down our number of cattle, and increase our flock of sheep; if it pays best to make beef, we let down our flock of sheep and grow more cattle; so that it depends wholly upon the consumption of wool and upon the consumption of beef as to the quantity that I myself produce.

2622. Can you give any average of the number of cattle that you are able to feed off generally on a farm of that size?—Yes, we usually turned off about 700 cattle a year of what we call full-fed cattle.

2623. Was that on the farm of 1,300 acres?—No, that was on the farm of 3,200 acres. On the smaller farm of 1,460 acres we calculated to turn off from 120 to 180 full-fed cattle, carrying at the same time from 1,000 to 1,200 sheep.

2624. Do you feed any swine at the same time?—We always follow our full-fed cattle with a pig to the head. For instance, when we are full-feeding 120 cattle, we should follow them with 120 to 130 hogs. Perhaps I had better explain a little as to how we fatten. We do not fatten in sheds or barns; we fatten out in the fields. We have two fields adjoining; we feed the

Chairman—continued.

the cattle in one field one day, and we take them out in the morning and put them in the other; and we put the hogs in the field where we have taken the cattle from, and the shell-corn and the corn that is not masticated by the cattle is gathered up by the hogs that follow them. Then we move the cattle back the next day, and the hogs follow them in the same way.

2625. So that you are able to keep about one hog per head of cattle on the farm?—Yes.

2626. And what proportion of sheep at the same time?—The sheep are not kept at all with the cattle, but are entirely separate and distinct from the cattle.

2627. Your experience, you say, of farming operations dates from 31 years back?—Yes.

2628. What was the date of the commencement of your new business as an exporter?—August the 2nd 1876; nearly a year ago.

2629. Did you begin largely in the business, or was it only a small trade?—We are not the largest shippers; we commenced on 100 cattle a week, and we have worked up until we are shipping 500 a week, and sometimes a little more.

2630. Do you believe that the trade is developing at all since you began it?—Very much.

2631. How is the business conducted from your first purchase of the cattle to sending the meat over here?—A portion of our cattle are bought in the different States; a large proportion, however, is bought in the city of Chicago, which is 1,000 miles from New York, and they are placed on the railway cars and shipped to New York. We have our own slaughter-houses there, and after our cattle have rested so as to become thoroughly cool, and get all the fever out of them that may have been produced by travelling so long a distance, they are placed in the slaughter-house and slaughtered. We leave them to hang from four to six hours, according to the weather, outside of the refrigerator. At the expiration of those four to six hours they are run into the refrigerator, into a temperature when first opened of probably 55 to 60 degrees; that temperature is gradually worked down until it comes to 37 or 38 degrees. We calculate to keep them in that refrigerator at least two days and nights, from 48 to 50 hours, before the meat goes on board the steamer. The offal from those cattle is thus disposed of; the blood is manufactured into a fertiliser; the hearts and livers are sold for food, being manufactured into what our Germans call the Bologna, and various other things; the bones are all manufactured into bone-dust, which is a very valuable fertiliser, and is used for the northern portions of our States up in the New England States; the tallow or fat is all taken from the entrails whilst the entrails are warm, so far as it can be done; and then the balance is thrown into steam-tanks and manufactured into a fertiliser, so that we utilise every portion of the animal, from the horns to the heels. All the feet are manufactured into glue; they are worth about 40 cents a set; that is about 5*d.* a foot. After the beef is sufficiently refrigerated it is canvassed; that is to say, a cloth is put over it made on purpose, so as to keep it clean in transit. It is then taken and put on board the vessel in a refrigerator which is prepared for the purpose. When it goes aboard the doors are sealed up, the machinery is put to

Chairman—continued.

work carried by the steam of the vessel, and it is brought at a temperature ranging from 36 to 40 degrees, and it is delivered at Liverpool, Bristol, Glasgow, and various ports here, and placed on the market.

2632. You say that you get a large proportion of the cattle from a considerable distance, and from different localities; do you find that the quality of the cattle varies in those different localities?—Yes.

2633. Are you limited to the best quality of cattle in carrying on this trade, or is it possible to treat it all in this way with the same results, so far as the market is concerned, when it arrives there?—We deal with nothing but the better class of cattle; the meat of the ordinary class of cattle, if I quite understand your question, is not the class of meat that it is desirable to bring. We find that our English friends are as fond of good beef, as we are; and ordinary beef is not, I think, well adapted to your market.

2634. Do you find that the quality varies very much in the different States?—Yes.

2635. That limits to a certain extent the supply that you can deal with, does it not?—No, I cannot exactly say that. I think that we have a sufficient supply in the States already furnished with good short-horned cattle to produce all that we may want for the present; and any increased demand that may come upon us from this English trade, if it should increase much more than at present, will be supplied, I have no doubt, as fast as the demand requires it.

2636. Do you mean to say that the supply of the best quality, which I understand is what you wish to get for this particular trade, is so large that the competition for it in the country will still leave a sufficient supply to meet even a larger demand than is now made upon it?—Yes. I think it is simply a matter of dollars and cents; we can give you all you want if you can give us the price for it.

2637. But what has been the range of the present price to be remunerative to the exporter?—Sixpence halfpenny a pound; and at 6½ *d.* a pound it will pay a very good profit.

2638. If that price continues, you believe that the supply will also be maintained on the other side?—I do.

2639. Is that 6½ *d.* per pound in Liverpool?—I mean 6½ *d.* wholesale in the London market; we can take a lesser price in Liverpool.

2640. You have described the treatment of this meat in the vessels; do you consider that the present system of the refrigerating on board ship is all that can be desired, or are there improvements that might be made?—I think that there will be great improvements made. There are constant efforts in that direction now, and I think the fertile brains of some of our Yankees will produce a system that will bring it to better advantage, because cheaper, than we are bringing it now.

2641. At present you bring the meat at this temperature to the ports?—Yes.

2642. After it has arrived in the ports, if your trade in that port is not sufficient for the amount of cargo sent over, you have to take it out of that atmospheric influence in which it has been kept and send it to other markets by rail, have you not?—Yes.

2643. That, I suppose, to a certain extent, prejudices the condition in which it is sent over?

—No,

Mr. *Gillett.*

8 June 1877.

Chairman—continued.

—No, I do not know that it does. Any person who is conversant with meat must know that if he take meat out of an atmosphere of 40 degrees, and puts it into a temperature of 50 degrees, or 65 degrees, or 85 degrees, as it was here on Monday, that meat, being colder than the atmosphere, the atmosphere will congeal on the meat and will consequently produce a dampness that will last perhaps for two hours. You let it remain in that same atmosphere for three hours, and that dampness will all disappear, and the meat is very thoroughly chilled from the marrow throughout; so that there is no danger of injury to that meat for any ordinary transit across England.

2644. You believe that it would bear the ordinary transit after it was taken out of the chamber?—Yes.

2645. For what time do you imagine it would remain exposed to the atmosphere after it was removed from the chamber, before any deterioration of the meat took place?—I made a test in September last year in Liverpool. I took meat out of the chamber at four o'clock in the afternoon on Tuesday; I got a butcher of the name of Baker at Birkenhead to hang that meat up; he was afraid that it would not keep, and I told him to take that quarter and hang it up; that I was going to London, and that I was going to be back on Saturday afternoon; that if the meat was good when I came back it was his, and he could pay for it; and that if it was not good, it was already mine, and I had paid for it. I went to his shop on the Saturday at seven o'clock, and he had cut the meat, and he had sent out a joint to a customer to roast for the Sunday, and the meat was in as fine condition as when it came out of the box. That was from Tuesday to Saturday in September; a very muggy spell of weather, too, it was. He killed some meat on the Friday, and hung it up in his shop, and when I got there on the Saturday some of his meat was off, and mine had hung there from the Tuesday.

2646. You state that, I suppose, to show that the way in which the meat keeps depends very much upon the condition in which the animal is killed?—No; I mean to say that it is the preparation entirely. I do not mean to say that a Yankee bullock will stand more heat than an English bullock.

2647. What I meant was that, whereas you take certain precautions before you kill your meat, and then submit it to an atmospheric influence which has a tendency to preserve it, it is in a better condition to stand the exposure than the meat of an animal which has, perhaps, been driven fresh into the town, been killed under the same conditions, and which has been hung up immediately and exposed to the atmosphere without the intermediate cooling process which has been gone through with your American meat?—Yes; I mean to say that it is the process that preserves the meat. When you slaughter a bullock and hang it in an atmosphere of 85 degrees, instead of chilling it, you heat the outside, and it becomes dry, and the animal heat centres to the bone, and cannot get out, and consequently spoils the meat; whereas, if it is cooled gradually, the animal heat is taken out of the bone, and the marrow and the meat is preserved, and it must commence to decay from the outside instead of from the inside; whilst fresh killed meat commences to decay from the inside instead of from the outside.

Chairman—continued.

2648. We had a witnesss before us at the last meeting of the Committee, Mr. Whitwell, who imported meat from America to Bristol. He stated that he found great differences in the cargoes which he had received; that he had only received five, I think, but that some of the cargoes were not in the same condition on arrival as the others were; have you found in your experience that there is any great variation in the cargoes?—Yes; the meat that Mr. Whitwell referred to belonged to your humble servant. I am the shipper on that line of his. The difficulty there was simply this. The first cargo went in very fine condition; the second cargo went short of ice; that is to say, the ice gave out; they were four days without ice, and the meat became soft. It was not spoilt by any means; the meat was good, but it was soft; not in such prime condition as it would have been in if he had, perhaps, six tons of ice. Then we are, and always shall be, liable to breakages of machinery. Our engines may break down, and if our duplicates are not just adapted to it we may be from 24 hours or 36 hours without running our machinery at sea; the result is that we have a change of temperature, and that will soften the meat; and if it becomes very soft before you get your machinery to work again and get the proper temperature, white or green mould will attach to the meat; it will not sour or smell, but the meat becomes unsightly.

2649. It all depends, then, I suppose, upon the possibility of keeping up the one regular temperature?—Yes.

2650. Is that a difficulty that you experience at all with the present kind of refrigerators in which the meat is shipped?—No, not when you put on ice.

2651. It really is a question simply of a proper supply of ice, to keep the meat in a temperature which will allow it always to be delivered in a condition such as you have described to the Committee, on which you may experimentalise to the extent of hanging it for that number of days in close weather?—It depends wholly upon the proper preparation of the meat before it goes into the vessel; that is the most important thing. The second is, having your box properly prepared. The third is, keeping your machinery in a proper condition, with a supply of means, such as ice.

2652. As the trade extends itself, I suppose, and as the demand for this supply increases, all these precautions will naturally be taken?—Yes; we are all experimenting, hoping to produce something that will bring it more cheaply. Some are hanging it a little heavier; that reduces the price of the freight, and they are testing how closely how many tons to the cubic ton measurement it will do to hang it. The result is, that every now and then they hang it too close together, and they mould it. Every one is trying experiments, in various ways, to get at the best and cheapest mode of doing it; the result is, that very little, while we have a cargo of meat that is in a bad condition. But the meat can be brought in perfect condition under the present process.

2653. Is your export trade limited to Liverpool and Bristol, or do you export to London also?—To London.

2654. Some

Chairman—continued.

2654. Some witnesses have stated to the Committee that the price of much of this meat has fallen very largely in London, and in Edinburgh, and Glasgow, I believe, and that a large quantity was selling for very much less than 6½ *d.* per pound; and they founded on that the argument that the trade could not last, because it would not be remunerative if those prices were all that could be made for it; have you experienced that?—Yes; but this trade in beef is governed by the laws of supply and demand, just as every other trade is that I know anything about.

2655. You mean that it was not in consequence of the meat that was sent over having deteriorated from the process which it had undergone, or from the time that it was on its journey, but that it was simply a glut in the market which prevented its realising its proper price?—I think that was the main cause.

2656. And you state that to the Committee from a knowledge of the sales in London to which the witnesses referred?—I state that from my own personal experience in the trade.

2657. I suppose that, under the conditions which you have stated, it would be perfectly possible to sell it in the port where it arrived, or at markets within a certain radius of that port to which you could send it during a given time; but have you considered the question of how you could distribute that meat throughout the country to the retail butchers, who have probably to keep it over a longer time on account of their demand not being so large as it is in large towns?—I came over with the full expectation of putting up a large refrigerator in Liverpool; I supposed that it would be necessary; but after having been here for two or three weeks, and looking over the ground, I came to the conclusion that it was not practicable and that it was not necessary, and I do not think now that it is necessary.

2658. You do not think that dead-meat stores, established at markets, are necessary for the carrying on of this trade?—I do not.

2659. I understood you to say that you began importing last August?—Yes.

2660. Did you import any quantity at that time into this country?—I keep up a shipment every week, and have kept increasing all the time.

2661. During the hot weather, do you find the same conditions in the meat that you have delivered as you have experienced since?—Yes.

2662. There was no difference prejudicial to the trade from the meat coming over in the hot weather?—Not at all. If the meat is put in in thorough condition before it goes aboard the steamer, you can ship it just as well in the dog-days as you can in December.

2663. Supposing the meat to have the proper preparation which you represent to be necessary, it is in such a condition that it is not affected for some days by change of atmosphere?—Not at all. If you ship it in August in a temperature of 38 degrees, I know of no difference between the August temperature of 38 degrees and the January temperature of 38 degrees as regards its effect on the meat. When your meat gets here, if your butchers in the provinces want meat two or three times a week, they can get it from your London market, or from Liverpool, or from Glasgow; it can be put on the railway trucks in the afternoon, and carried 200 or 300 miles, and delivered the

Chairman—continued.

next morning to the butchers, and he can supply the consumer with it. That meat will keep safely from the Tuesday to the next Friday. On Friday he wants more for the Saturday's market. If he buys meat twice a week he can keep that meat in his shop with perfect safety for three days after it is delivered from either of those ports. Hence I have come to the conclusion that there is no necessity for having refrigerating rooms all over the country, or putting up one myself to protect ourselves at Bristol, Liverpool or Glasgow.

2664. You believe that that would be the case in the hot weather, and that the travelling by the railroad to the different localities in that hot weather, would prevent the meat arriving at its destination in a condition in which it would be marketable?—No, I think not.

2665. I understand you to say that in the trade which you are carrying on, you dispose of the offal, the hides and hoofs, and so forth, in America?—Yes.

2666. Have you ever attempted to send over offal as a part of a cargo?—I have not.

2667. So that you could not state that this refrigerating process would bring offal over in a condition to enable it to compete in the market with the offal of animals which are killed here?—I could not speak from experience, as we have not shipped any.

2668. Do you believe that this trade will extend?—Yes.

2669. If the price which you have mentioned can be maintained, you think there is not only sufficient stock to increase the trade, but that there would be sufficient inducement to American enterprise to continue it for the purpose of getting a dead-meat trade established in this country?—I do. Perhaps there has been no time for the last 10 years when we could have been taken more short than this present season. You will notice that the price of cattle has advanced in America, as the result of the draft that is being made from our herds there for this English market; and I will explain this, so that perhaps the Committee will get a better idea of it. As you see, we commence feeding cattle there two years prior to turning them off. Two years ago last fall our feeders took in their stock cattle at a high price. Last year our market declined on them to such an extent that our farmers, who fatten their cattle, did not make any money out of them; they perhaps got about the same price last spring and summer for their beef that their fatting cattle cost them in the fall; the result was that they lost their crops; and when our farmers lose one crop they try another class of crop; they think, perhaps, sheep or hogs will do better. Hogs were doing much better, and the result was that they did not put in a large amount of fattening cattle last fall, but fed their corn more to hogs and to sheep, so that we commenced this season with a lesser quantity of fat cattle than we have had, perhaps, for the last seven or eight years. Instead of the market declining, as they feared it would, the market has been gradually going up; and now, with the prospect of a good crop before us, and a heavy last year's supply on our hands, the result is, that the amount of cattle that will be fed this coming winter, as compared with the past winter, will range at an increase of 30 to 40 per cent. The result is, that if you want 25 to 30

Mr. *Gillett.*

8 June 1877.

Chairman—continued.

per cent. more cattle next year than you have had this year, you have only to beckon to us and we will have them ready for you.

2670. Therefore you believe that this country may look forward to a regular supply from America?—I do.

2671. And that the trade with America, which has started in this way will, from its being a profitable trade, be a continuous one?—I think that it will be a regular line of trade and business.

2672. And one which you believe, from your experience, can be carried out during the whole course of the year, so as to place the meat upon the English market in such a condition that it can compete with meat killed in this country?—I do.

2673. Is there any other point which you would wish to state with regard to this trade?—No; I am ready to answer all questions, but I have nothing to suggest, that I know of.

Mr. *W. E. Forster.*

2674. I suppose you cannot tell the Committee how many head of cattle have been slaughtered for the English market since the trade began?—I cannot.

2675. Can you give us any idea of it at all?—I cannot; I did not know what you desired to know from me or I would have obtained the information.

2676. My reason for asking you the question is, that I want, if possible, to form some idea of the proportion that the consumption of American meat bears to our general consumption of meat, but you cannot give me any information upon that point?—I cannot. You can approximate to it very closely from the port entries at Bristol, Liverpool, Glasgow, and London.

2677. Those port entries will tell us the weight of the meat that has come in?—Yes.

2678. Could you give us any estimate of the proportion which that weight would bear to the number of beasts?—About three bullocks to the ton is a fair average. If you get the port entries and put them together, and divide the result by three, you will have the number of cattle.

2679. Before you thought of importing this dead meat to Europe, had there not been some import of dead meat from the interior of America to New York by rail?—Yes.

2680. Has not that gone on to a considerable extent?—Yes.

2681. Why, then, do you slaughter your animals at New York rather than at Chicago?—Because our machinery for refrigerating is all at New York; and when we have got our meat properly prepared for the vessel, we must have it ready at a particular time. We cannot always get a train of dead meat 1,000 miles just before the steamers are going away. Perhaps the steamboat people say to us, "You can commence loading at one o'clock," and if our train has to come 1,000 miles, we cannot have our beef there exactly at one o'clock.

2682. But New York is a good deal fed by dead meat from the interior towns, is it not?—To some extent it is.

2683. Still you think it is more to your advantage to send the animals alive to New York than to kill them at a distance?—Yes.

2684. The railway journey from Chicago to

Mr. *W. E. Forster*—continued.

New York is about 1,000 miles, is it not?—Yes.

2685. How long does that take?—From five to six days.

2686. What arrangements have you for watering the cattle on the road?—We take them off three times and water and feed them.

2687. You take them off at Pittsburgh and Harrisburgh, I suppose?—Yes.

2688. Would you take them off at three distinct places between Chicago and New York?—We always prefer to take them off three times in warm weather.

2689. What is the freight for live animals from Chicago to New York?—Forty-five cents per 100 lbs. now.

2690. Do you think that any of those beasts that are killed for the English market came from Colorado?—No, I think not. I have never seen cattle slaughtered that came from Colorado.

2691. I suppose that you look forward to Colorado supplying the English markets hereafter?—They have not got the quality of cattle there, but they are coming in from these Western and South-western States to us, and buying our short-horn stock that we originally borrowed from you, and they are taking it into those Western territories and Southern States, and they will in a very few years so improve their cattle that they will have a fine high grade of cattle.

2692. Yo do not think that the enormous distance of Colorado, say Denver, from New York, would prevent its being profitable to send cattle from there?—I do not.

2693. What price, do you think here, would stop the trade and make it an unprofitable trade; do not answer the question unless you like?—I named $6\frac{1}{2}$ *d.* a pound as a price. I only tell you that they would probably keep on trying until they got it down to $5\frac{1}{2}$ *d.*; if they found that, that would probably stop it for a little while and rest, and in that time the price of cattle would probably go down a little with us; then we would send it here again, and by the time it got here, your market would be a little up, and we should go on again.

2694. During the last few years what is the lowest price at which it would have been profitable to send it over from New York?—I have furnished a great many hundreds of cattle in New York at $1\frac{3}{4}$ *d.* per pound.

2695. You have great confidence in the future development of the trade?—Yes, I have.

2696. But of course you do not want any legislative measures in England to give you protection for that trade?—No.

2697. You think that it is quite able to take care of itself, and to obtain the development which you believe it will come to reach?—Yes, under our present circumstances. I do not see that we need any legislation. We keep buying of you, and exchanging with you for the finer bloods of cattle, but we have such large herds of fine cattle in our South-western and Western States, Illinois, Indiana, Kentucky, and Pennsylvania, that we can get along without borrowing any of you for the next four or five years.

Mr. *Chaplin.*

2698. I suppose we may consider, then, that the supply from America will be practically unlimited?—Yes, practically unlimited.

2699. You

Mr. *Chaplin*—continued.

2699. You anticipate, as I understand, that the present supply will certainly continue, and that it will probably increase?—Yes.

2700. At the same price?—What do you mean by the same price?

2701. Do you think that it is likely to increase?—If you mean the price that I named, viz., 6½ *d.* per pound, I say yes; but if it is 5½ *d.* a pound it will probably slacken up until you get hungry.

2702. But is it likely to continue at the price at which it is supplied now?—I think it is.

2703. You have no fear of the hot weather?—No.

2704. I understood you to say that you imported some last August; was it very hot at that time?—We thought it was pretty hot with us; we loaded the Cunard boat "Abyssinia" on the 2nd of August, and the thermometer was 104 degrees in the shade when we loaded.

2705. Have you imported any in the hot weather which we have had in the last fortnight?—Yes, every week, two or three cargoes a week.

2706. With equal success?—No.

2707. With no deterioration?— Yes; there has been deterioration with us, not on account of the weather though.

2708. On account of what; the price?—No, it was not on that account; it was because they did not load ice enough in two instances, and because our machinery broke down in another instance.

2709. That was in the case which Mr. Whitwell mentioned in his evidence?—Yes.

2710. I understand you to say that that was entirely owing to your system not being properly carried out?—That was so.

2711. Do you remember the date of the last importation?—Yes; our last was on the 8th of June 1877.

2712. So far as the transit by sea is concerned, there is not the slightest difficulty?—No.

2713. Is the meat brought in carcases?—No, it is brought in quarters.

2714. It was suggested the other day, by one of the witnesses, that an improvement might be made, by having the refrigerators in more chambers than one; are you of that opinion?—I am.

2715. You think that there would be some practical advantage in that?—Yes.

2716. Is that consistent with what I understood you to say just now, viz., that the perfect transit of the meat by land depended upon the perfection of the process of preparation?—Yes.

2717. But if it was perfectly prepared, you would not require more than one chamber?—Allow me to explain. If you have four compartments, and if you have 500 head of cattle in a vessel, you have them in four compartments, and a machine attached to each of your compartments; if one of your machines breaks down, you jeopardise one quarter of your cargo. If it is all in one compartment, and you have one machine, you jeopardise 500 head of cattle, instead of 125.

Chairman.

2718. Is there not also another advantage arising from your having several compartments, viz., that if the market price does not suit on the arrival of the meat in this country, or if it does not suit for the whole of your cargo, if you had it in divided chambers, you could still keep one or more of the chambers ready for a further market?—Certainly. It does away with the necessity of putting further refrigerators on shore. We have one compartment that carries 1,200 quarters, and we are dividing it, and putting the meat in two compartments; so that if the market does not suit us, we can keep back one half, and sell it the next week.

Chairman—continued.

Mr. *Chaplin.*

2719. Did I correctly understand you to say, that if your meat had been perfectly prepared, it would keep longer than English meat killed in the ordinary way?—It will; or than American meat either.

2720. I suppose that if English meat were killed under the same process, it would keep equally well?—Equally well.

2721. But you think that your meat would travel farther, and keep better, than meat which is killed under the present system in England?—Unquestionably.

Colonel *Kingscote.*

2722. Is it your opinion that the herds of cattle in America have improved during your experience?—Yes.

2723. To what do you attribute their improvement?—To the shorthorns of England. We commenced importing in 1836, that is, before I knew very much about it; and we have kept importing ever since the finest cattle, and crossing them with our native cattle.

2724. Are you aware that the importation of English cattle into America is stopped now?—Yes.

2725. Do you think that that stoppage is a detriment to your country?—At present I do not.

2726. Why not?—I think that we have got as good cattle there as you have here.

2727. I am told that in Texas, where there are large herds of cattle, there is a great demand now for pure pedigreed, shorthorned bulls; can you in America keep up that supply?—I think we can, for the next three to five years. We cannot breed in and in. After we have kept a bull a certain time we can dispose of him.

2728. Still, so far as price goes, it would help those who breed herds of cattle in Texas, if there was an importation from England, would it not?—I do not know; I think that we can furnish them quite as cheaply as you can here.

2729. But still you are sorry to see a stoppage of the importation from this country, for the sake of the consumer?—I would prefer not to see it; but still, I think we shall not be very seriously injured, for the next three years at any rate.

2730. Did I correctly understand you to say that you had had experience in the exportation of live-stock from America to England?—From England to America.

2731. Not from America to England?—No.

2732. You are aware that live cattle do come from America to England, are you not?—Yes.

2733. But you cannot tell me anything about that?—Only that I see them arriving in good condition; I have seen a few of them slaughtered here.

2734. As I understand you, you are a large shipper of dead meat from America to England,

Mr. *Gillett.*

8 June 1877.

Colonel *Kingscote*—continued.

and you would sooner keep on in that trade than go in for the live-stock trade?—Yes.

2735. You think that there is a good deal of risk in bringing live-stock over?—That has been my opinion. It has been more successful than I supposed it would be, but I have not had confidence in it as a permanent thing. They certainly cannot succeed in the winter, in November, December, January, and February; I think it must be very risky indeed.

2736. In spite of the losses which you have sustained by your cargoes with dead meat not coming over good, you still intend to continue that trade?—Most certainly. As a farmer, when I ploughed, I ploughed and sowed; if it failed to rain I could not help it; if I did not get a crop, I did not throw my plough into the corner of the fence, and vow that I would never plough again; but I waited, and trusted to Providence, and I most always succeeded, and I trust I shall again.

2737. You have great faith in farming and dead meat?—Yes, I have.

Mr. *John Holms.*

2738. What price did you get in the London market for what came in indifferent order?—It would sell just according to the prices; there would be some pieces that would not fetch more than 2 *d.* a pound, and some would bring in 3 *d.*, and all the way up to 6 *d.*

2739. Then that which was indifferent sold in the London market at from 2 *d.* to 6 *d.* per lb.?—From 2 *d.* to 4 *d.*

2740. Did the average price of 6½ *d.*, which you spoke of, include all those lower prices?—No, I meant beef in good condition. On those cargoes that are indifferent, and that sell for these lower prices, of course there is a loss.

2741. I think you said that the value of the meat per pound in America, in New York, was 1¾ *d.* per pound?—No; I was asked what price I had furnished meat for, and I said that I had furnished years ago many hundreds of pounds at as low as 1¾ *d.* per lb.

2742. What is the ordinary price of beef in New York?—From the time when I commenced up to the present time it has varied. Our market is governed by supply and demand, of course, but perhaps the average price of the market has been 5 *d.* 10 cents. per lb. in New York for prime beef.

2743. What would be the total expense per lb. of the transport of ice and other costs between New York and this country?—So far as I am concerned, I have no objection to answering the question, but I have some friends who perhaps might think that question personal, and I would rather not answer it.

2744. Of course, this being an experiment, comparatively speaking, the growers are improving the cattle so as to supply our wants, and also you are gaining experience by degrees as to the bringing of meat, for instance, by the division of the chamber into many chambers, and so on; and it is possible that with the unlimited supply which you say exists in America, and with all these improvements, you may have even a lower price than you spoke of just now?—It is possible.

2745. A good deal has been said about the loss to the poor people of this country from the importation of dead meat, by their not having the offal; take an ox of an average weight, say 700 lbs. of dressed meat, could you say what proportion the offal would bear to such a weight?—Do you mean to include the hide in that?

Mr. *John Holms*—continued.

2746. I only mean to include what is eatable?—That would depend very much upon what they eat of it.

2747. What would you describe as offal fit for food?—There is nothing of the inner part of a bullock that is fit to be eaten, apart from the heart and the liver.

2748. And the fat?—Yes; but that we do not eat; we make tallow candles out of the fat.

2749. What would you say was the weight of the liver and heart of an ox weighing 700 lbs.?—They vary; 35 lbs. to 55 lbs.

2750. What would it be in an ox yielding 700 lbs.?—I should think about 42 lbs. or 43 lbs.

2751. You spoke about the quantity of American cattle being without limit; can you give any definite data to the Committee, for instance, as to the exact number of cattle which you have throughout the States, in the same way as we have a clear return in this country of the number of cattle?—I cannot, because I have not the statistics. Of course we know the number of head of cattle in each county and in each State, of the United States; they go to the Statistical Bureau every spring, but I have nothing of the kind with me, and I could not approximate to it.

2752. All the cargoes that arrived at Bristol were not very satisfactory, but I think that you also import to Liverpool?—Yes.

2753. What is your experience there as regards the cargoes arriving in good condition?—We have had very favourable experience there.

2754. How many cargoes have you shipped to Liverpool?—We commenced with one a week, with two a week alternately in five weeks; then we got up to two a week, and then we got up to six a week, and five out of the six come to Liverpool; that is the most we ever had there in one week. I should think we should average, from the 1st of last August up to the present time, say, three a week, and two out of the three would be to Liverpool.

2755. What proportion have you lost at Liverpool out of that number?—We incurred a loss on board the "England," which was the second shipment we ever made, on account of the imperfect box; we have had out of them, perhaps, nine to the best of my recollection.

2756. Then I suppose you do not lose any at all, excepting through the breaking of the machinery, over which you have no control?—No; of course it is subject, like a vessel at sea, to all these breakdowns.

2757. Then the point is simply this: that as you gain experience you may be pretty safe in saying that you will gain certainty in being able to deliver the meat as fresh in Liverpool as when it was killed in New York?—Quite so.

2758. And now it is a question of no speculation whatever, but of certainty?—Yes; we consider it quite as certain as any other commercial businsss that is done from the States to England. I would a great deal rather ship beef than ship bacon or flour.

2759. Is it not the case, that from the fact of that meat, when it is killed at New York, being very

Mr. *John Holms*—continued.

very carefully treated before you put it on board, that is to say, reduced to the temperature which you want to maintain all through, in the hottest weather, that meat when it is delivered in Liverpool would practically keep longer and be better than meat that had been killed at Liverpool itself on the morning that the vessel arrived?—Yes, it will keep longer. I will venture to hang up any amount of quarters of beef against any man that kills his beef this afternoon say, and if mine after it has been killed 21 days does not keep longer than his does, he can have it all.

2760. You said that 5 *d.* might be taken as about the fair price of meat at New York?—I spoke of it as being the average price from last August to the present time; it is much higher now.

2761. At that time what would be the price per pound that you would put upon the offal there?—I do not know that I understand what you mean by the offal.

2762. I mean that which you told us would be about 42 lbs. weight in a 700 lb. ox?—We contract summer and winter with what we called the Bologna sausage-makers.

2763. What would be the price of that?—Sometimes we sell the liver for 42½ or 45 cents, and I think this year we are selling the hearts at 17½ cents.

2764. Is that about 30 *d.* altogether?—Yes.

2765. That is the value of the heart and the liver?—Yes. Then we sell the stomachs also. The little offal as we call it, that is to say the heart, and the liver, and the head, after the meat is taken out, and the hoofs and the entrails we consider worth 1 dollar 45 cents. to 1 dollar 50 cents. That would be on an average, probably about 6 *s.* of your money per bullock.

Mr. *Elliot.*

2766. Is it a fact that several cargoes have quite recently arrived in this country in bad condition?—Yes.

2767. Is that to be accounted for in any other way than by the weather?—Yes, I can account for it by seven cargoes of beef not having been refrigerated. They undertook the shipment without preparation; they were not refrigerated at all; they attempted to put the meat on to the boat and refrigerate it in the boat; which cannot be done.

2768. Did not the hot weather commence a little earlier than was expected this year?—Yes.

2769. Had not that something to do with it?—Yes, it had this to do with it, that it caught them without sufficient preparation; without their refrigerators.

2770. Do they only refrigerate at certain times of the year?—Yes, we need our refrigerators just as much in severely cold weather to keep the meat from freezing as in severely hot weather to preserve it from decomposition.

2771. Does it pay better to send dead meat or live meat from America?—I have not shipped any live cattle; I only know what I am told. I have no personal knowledge of it. If speculators and operators think it to their interest not fully to explain it, they perhaps might not explain it, so that I cannot speak from experience. I only know that I myself prefer to deal with the dead meat.

2772. You said that 5 *d.* per lb. was the price of meat in New York, did you not?—I was

Mr. *Elliot*—continued.

asked the average price from last August to the present time. I should think that that was about the average price.

2773. Is that the price to the consumer?—No, that is the wholesale price.

2774. That does not represent what you put it on board the ship at, of course; you make contracts no doubt, or bring it from your own farm?—No, we buy our cattle at Chicago and in the different States, and that is about what they would cost there to men shipping or to wholesale dealers; it would be about 10 cents per lb.

Mr. *Murphy.*

2775. I take it for granted that your slaughter-houses are near the ship's side?—No.

2776. What distance are they from the vessel?—They vary from one mile to ten miles.

2777. Do you slaughter cattle ten miles away, and then ship them?—Yes.

2778. What time elapses between their being taken from the refrigerator and their being put on board?—That is according to the distance, and it depends greatly upon what time they commence loading. Sometimes they are compelled to keep it a long time on the truck before they can get off to load.

2779. Supposing that the slaughter-house is 10 miles distant from the place of shipping, and that the weather is very hot, does that affect it?—No; we place it on our vans there, which are air-tight, with an oil-cloth. We fill up the van, and turn the cloth over it, and it retains its coolness and is very little affected by the heat in going to the ship.

2780. Have you any idea of what quantity is killed in New York for the purposes of shipment?—I can tell you about what quantity is being killed there weekly now; it is very much increased. We are killing in New York about 1,400 a-week for shipment. There are three of us shipping there.

2781. Is New York the principal shipping port for dead meat?—Yes, they ship more from there than from any other port.

2782. They ship quantities, I suppose, from other ports?—Yes.

Mr. *James Corry.*

2783. Do you supply the machinery for keeping the meat on board the ship?—Yes.

2784. It does not belong to the ship?—No.

Mr. *Torr.*

2785. You say that all meat either is or ought to be subjected to a refrigerating process for one or two days before shipment?—Yes, in warm weather.

2786. And on that depends the success of the operation?—Yes.

2787. Have you public refrigerators that any one can send his meat to?—No.

2788. It is only the shippers who provide refrigerators?—That is all.

2789. When you get your meat on board have you everything to find?—Yes.

2790 You provide space and you provide this machinery that you speak of for pumping cold air?—There are two or three different processes, but each one under his own process furnishes his own materials.

2791. And his own ice?—And his own ice.

2792. Then all the transactions between you

Mr. *Gillett.*

8 June 1877.

Mr. *Torr*—continued.

and the owner of the vessel is payment of so much per ton?—So much per ton cubic measure.

2793. Since this trade has increased very materially, have you found that the freights have advanced upon you?—Not at all; they started with them at a very high rate.

2794. And you have not got those rates down?—No.

2795. Do all the lines of steamers between Liverpool and New York now carry dead meat?—The "Cunard," the "White Star," the "Inman," the "National," the "Guion," and the "Anchor."

2796. Do all those five lines now lay themselves out for carrying dead meat?—Yes.

2797. Do any of them lay themselves out for carrying live meat?—Not from New York, I believe. The "Guion" Line have carried some and the "National" Line are carrying some, but the "Inman" Line, the "White Star" Line, and the "Cunard" Line, I think, are not carrying live cattle.

2798. If they carry live cattle of course they will have to make certain preparations for it, as they have done for your dead meat?—They would require a different kind of space for live cattle. The boats have got to be peculiarly constructed, and the "White Star," the "Inman," and the "Cunard" boats, I think, are not very well calculated to carry live cattle.

2799. Do you think that all these lines are as well adapted for carrying live cattle as they are for carrying dead meat?—No; we can take any clear space in the vessel and build a refrigerator in it; but you cannot carry live cattle in every part of the vessel; you must have them up where they can have air and light.

2800. Therefore you would say that the convenience for carrying dead meat is much greater than it is for carrying live cattle as the vessels are now constructed?—Yes, I should.

2801. Do you anticipate much change in the freight for dead meat?—I do not; I think that if there is any change it will be made lower.

2802. Supposing that your trade increased, as you rather pictured to us that it would increase, do you think that it will affect the freights?—I do not think that it would affect the freight. They are all very well satisfied; it is a very paying rate to them; they are getting more from us per cubic foot than they get for carrying the United States mails.

2803. You do not foresee any serious impediment which is likely to obstruct this dead-meat trade?—Not at all; I see nothing to induce me to believe that it will not be continued, and become a steady, permanent trade and business.

2804. Just as steady as any other trade between New York and Liverpool?—Just so.

2805. Have you found any difficulty in disposing of your cargoes at Liverpool as they have arrived?—No; we find the market sometimes up and sometimes down, as we should find it for any staple commodity.

2806. Have you found it necessary at any time to send any cargoes to other markets, to the interior markets; for instance, to Birmingham or to Manchester, because you could not sell them in Liverpool?—Not because we could not sell them there, but because we could get a better price in Manchester and Birmingham and those other provincial towns.

2807. There has been up to this time a demand in Liverpool, if you take the current

Mr. *Torr*—continued.

market, for all that you have brought?—I do not know that I could say that. I do not think there has. This meat is not consumed in Liverpool, and our market there is from buyers all through the provincial towns.

2808. Do you find that buyers come in from the interior markets now to Liverpool as a centre port for dead meat?—Yes.

2809. And there are now large depôts for the sale of American meat in Liverpool that deal in other meat?—Yes, there are some.

2810. Have you made an estimate of what per-centage of bad meat has come over, taking the time that you have been in the trade, as against your total import?—Including the cargo of the "England," which was almost a total loss, it has been about 7 per cent.

2811. About 7 per cent. of the meat has come in bad condition?—Yes.

2812. As to the relative value of the inferior meat as compared with your prime meat, what would that amount to per lb.?—I should think it would amount to from 2 *d.* to 2½ *d.* per lb.

2813. That is between the average of your inferior meat and the average of your prime meat?—Yes.

2814. You said that there has been a rise in the price of meat in New York since this trade began, but you have not told us to what extent that rise has taken place?—I should think that the rise has been 1 *d.* per lb. there; that would be two cents per lb. in our money.

2815. But yet there is an ample margin for the trade being carried on?—If you will give us 6½ *d.* per lb., I think there is.

2816. What change has taken place in England, and what is the difference, taking Liverpool as your centre, between the market, when it was first opened, and when this dead meat was comparatively unknown, and the market now; has the price risen or fallen?—I think that it has about maintained itself; I do not think that there is any great change. It is not the same each week; the rate goes up and down. I should think that in the average of the market there is but very little change.

2817. And therefore the increased demand has been equal to the increased supply without putting down the price?—Yes, I think quite so.

2818. You spoke of feeding your cattle on grass, with corn; you mean Indian corn, I suppose?—Yes.

2819. Do you thrash that corn before you give it to them?—No; we draw it out of the wagons and put it down, fodder and all.

2820. Is it put down full length in the cobs?—Yes, in the cobs.

2821. And then the pigs follow the cattle?—Yes, they follow and take up all the shatterings and the corn that is undigested as it passes from the cattle.

2822. Where do the pigs go to?—Those pigs go to Cincinnatti, St. Louis, Chicago, and so forth.

2823. But you never send them to this market?—No.

2824. You have never tried the experiment?—Yes; I shipped five in a box, simply to see how I could get them here.

2825. Did the pork keep as well as the beef?—Yes, we could keep the pork without any difficulty at all, but those were shipped without being

Mr. *Torr*—continued.

being entirely refrigerated, or, in other words, before they went to the refrigerator. Our pork slaughter-house is 3½ miles from our beef slaughter-house, and that meat was killed in the afternoon, at 4 o'clock, and put on to the truck the next morning at 9 o'clock, on a very hot day, with the temperature of 87 degrees to 90 degrees, and taken down, some 12 or 14 hours intervening between the time when it was killed and the time when it went into the slaughter-house. It became indisposed at the bone before it went into the refrigerator at all.

2826. Do you anticipate that when this refrigerating apparatus is more perfect you will send pork in large quantities?—I have no doubt that it will be done. We send mutton, and we send it here successfully; and I have no doubt that pork will come. We are sending you Indian corn at such a low rate now that you can feed your own pigs with very great advantage, and if we can get the corn up so high that you cannot feed your own pigs, then we will send you the pigs instead of the corn.

2827. I suppose the black population of the South are still your great customers for pork?—Yes, for bacon.

2828. You look forward each year to carrying on your operations in imported meat with greater certainty, because your means of conveyance, and your knowledge of the trade will have largely improved?—Yes; we are gaining experience every week.

2829. Therefore, your risk is much less?—Yes, much less.

Mr. *Wilbraham Egerton.*

2830. You have been asked about keeping the meat immediately after it is slaughtered; how long can you keep meat in America when it is killed at a temperature of 80° or 90°, or 100° in the shade?—Our butchers kill it in a slaughter-house; they commence killing at 4 o'clock or 5 o'clock in the afternoon, or later if it is extremely hot, and they let it hang up in the slaughter-house with the doors and windows all open with as much air as they can get to cool it. Then early in the morning, at 1 or 2 o'clock, that meat is taken into the butcher's shop; all our butchers' shops are provided with refrigirators, and the meat is put into refrigirators there and then; a quarter is taken out at a time and used for customersas they want it.

2831. Then your butchers do not suffer from meat being tainted as our butchers, unfortunately, very often do in London?—I do not wonder at it, because I have never been into a butcher's shop here that I thought was properly prepared for preserving the meat.

2832. Then it is quite possible that, although your temperature is very much higher in summer than ours, owing, perhaps, to your climate being drier, and to your not having the same thundery weather that we have, and owing also to your having better appliances, you are able to keep the meat in a better condition than the butchers in our large towns in England can?—I should think so.

2833. Therefore that is the answer to any doubt that may have been expressed as to the state of the weather when the animal is slaughtered on your side of the water; that you take such care for the first 12 hours until the meat is placed in the refrigerators, that there is no fear of its

Mr. *Wilbraham Egerton*—continued.

becoming tainted before it is placed in the refrigerators?—If the meat were left to hang in a temperature of say 85° to 90° for 12 or 15 hours, until it started, neither saltpeter nor ice would save it then.

2834. Have you ever heard any complaints that this American meat which has been imported to England sometimes in cooking loses its heart or quality, and shrinks?—I have never heard of such a thing; I have heard the contrary.

2835. Then, if such a case has arisen when the meat was not in a good condition, that has been from some want of care after it has been landed?—It is possible that it might be after it was landed, but it is more likely that it was not properly prepared before it went on board the steamer.

2836. You think that in a short time no complaints of that kind are ever likely to arise as to meat coming from America, either from deterioration of quality or from want of flavour in any way when it is cooked?—No. If you were practical, if you understood butchering, if you understood packing beef and pork, or anything of that kind, you would know at once that there was not a particle of sound philosophy in that. If you take a piece of meat and dry it thoroughly through, being compelled to retain all its juices, and then put into water or into brine, and find that it shrinks, it is the most singular state of things I ever heard of. I always find it to enlarge and become heavier. If you take dried pork or beef, and put it into any solution, it will gain from 10 to 17 per cent., and I cannot understand how a cook would put a piece of American beef that was thoroughly cooled through into water to boil it, or into an oven to bake it, and find it to grow less.

2837. I have heard it stated that the air of the refrigerators when they arrive is very often not very sweet; is the air constantly changed during the passage; is there a constant flow of air through the compartments, or is the air kept at a certain temperature without being changed?—We propose to have our boxes entirely air-tight.

2838. Then there will be no change of air?—If I understand anything about philosophy in air at all, there is no such thing as still air, I have never heard of it.

2839. Then you mean to say that no compartment will be so tight that no air will come in?—We propose in the first place to have our chambers entirely air-tight; we seal them up expecting to have them air-tight, and we have them so as nearly as possible. We produce cold air by a fan principle, blowing it over a body of ice, there is a circulation of air there. That is one process, and there are two or three more on the same principle. The process upon which I ship is on the principle of a solution of salt and ice passing through a coil of pipe, passing entirely round the room. We get a very cold atmosphere from that, and any dampness that may be in the box is attracted to those pipes immediately by the effect of the cold, and the cold air always descending and the warm air always ascending, there must be some place for the warm air to get away, and it cannot get away without producing circulation. As the cold air comes down the warm air goes up.

2840. Then the air keeps circulating in these air-tight compartments?—Certainly.

2841. Do

Mr. *Gillett.*

8 June 1877.

Mr. *Assheton*—continued.

2841. Do you consider that in America you will always be able to compete with our graziers and to supply meat cheaper than we can produce it?—I see no reason why we should not. As long as we can keep pushing out into the west, and raising corn on land that costs us from 1 *l.* to 2 *l.* an acre, I cannot understand why we cannot furnish corn to make beef and pork cheaper than you can on land that is worth 1,000 guineas an acre, perhaps.

2842. I want to know what is the amount of acreage which you have which you think will be available for the grazing purposes of the future; you consider that it is practically unlimited for our purposes?—My own impression is that this trade will increase, and will continue to increase, and I think the result will be that you, as farmers, will have to turn your attention to something more profitable than raising beef on your thousand guinea land. We expect to keep on going south and going west for years and years; we are only in our infantile state, and I think there is no doubt that within the next 20 years we can furnish you 20,000 head of cattle a day if you want them.

Mr. *Jacob Bright.*

2843. What is the lowest price that you have hitherto got for sound beef on this side?—My friend, Mr. Link, does not recollect it, perhaps, as well as I do, for it did not affect his pocket and it did mine. I think in the month of November we had two cargoes of beef sold here, as far as I was ever able to discover, at 3 *d.* per pound, wholesale price.

2844. Was that sold in London?—Yes.

2845. Have you ever sold any at a lower price than that?—I thought that was quite low enough for good beef.

2846. Am I to understand that for good beef that is the lowest price that you would take?—That is the lowest price I would take.

2847. You admit that a good deal of beef has been condemned?—Yes, there has been some condemned; I do not know how much.

2848. I understood you say that it is only condemned through mismanagement?—Allow me to correct you in your term. There is a difference between meat being in a bad condition and being condemned. We, as handlers of meat, understand condemned meat to mean meat which is unfit for human food; and there has not been much of that in comparison with the amount that has come here.

2849. And when American meat that has come here has been unfit for human food, you would say that it is from want of knowledge of the process, or from carelessness with regard to the process?—Yes, it is from want of knowledge and from experimenting.

2850. And with the growth of experience and knowledge you believe there will be very little of that?—Very little.

2851. You have spoken of the meat being thoroughly cooled by the process before it arrives here; how long a time would it take in order to make meat as cold as you think it should be?—We propose to have it as cold as we want it before we start at all.

2852. Supposing that the two countries were nearer to each other, as in the case of continental countries attempting to send dead meat to England, the voyage would be very short, but that would be no objection; you would have the meat sufficiently cool in spite of that?—The meat, in order to make a journey at all in a vessel or on a railway in the hot season, would require just as thorough refrigeration to bring it 500 miles as it would to carry it 5,000 miles. The thing is to get the animal heat out of the meat, and then you can carry it for 10 days, or 30 days, or 60 days, if you keep up your material.

Mr. *Jacob Bright*—continued.

2853. Then you maintain that when your meat lands in England it will keep good as long as, or even longer than, English meat killed at the same moment as the American meat arrives in England?—I claim that it will keep longer; under the process I believe it will keep longer; it is prepared to stand the weather, and it will keep longer.

Chairman.

2854. I think you distinctly state to the Committee, that in the cases in which it has been pointed out that the meat has not arrived here in the condition in which it ought to have arrived, it has been the fault of the way in which it has beeen sent over, and because people in America are now making experiments rather than carrying out an acknowledged established trade?—Yes; then there are those gentlemen who commenced last fall, and when the warm weather came, they had no preparation made for it at all; that was the case with two companies; they had no refrigerators. The hot weather came upon us 15 or 18 days earlier this season than it has ever done before, and the result was that they were caught, as we very often say there, with their pantaloons down. They had their vessels all ready; they had been shipping, and they put their meat on board without its being refrigerated.

2855. And that would be the answer to the evidence which Mr. Swan gave here the other day, when he stated that he did not believe that this trade would continue in the hot weather, and gave it as his reason for it, that if the meat is sold at once it looks very well, for perhaps a day afterwards, but that in the course of a day or two afterwards it decays, and loses bloom, and smells badly; you believe that he must have referred to part of a cargo which had not been properly treated?—Yes; you may take a carcase of your own meat killed here, and hang it up, and the action of the air and heat upon it will take the bloom and that bright red colour off, and it will take a dark line, but it does not become injured, and the moment you cut through that outside crust or scum of the flesh, it is just as fresh as it ever was before.

2856. I understood you to say that it is equally as important to refrigerate the meat in winter as in summer?—Yes; what I mean by refrigeration is to keep the meat in the same temperature, say ranging from 38° to 40°. We think it just as important to have our refrigerators to put our meat in in winter, because we do not want to freeze the meat. If, for instance, you commence killing in our cold climate with the thermometer down to 20°, that cold air striking the meat immediately after killing it, chills the outside and closes up the pores, so that the natural heat of the animal cannot get out; it is shut in, and the meat, as it were, crusts over on the outside; you freeze it up in that condition, and

Chairman—continued.

and as soon as the frost in the outer portion of the meat comes out, it begins to spoil next to the bone.

2857. In fact, it all depends upon the way in which it is prepared?—That is so.

2858. You let fall just now in answer to a question, a word about mutton; have you imported mutton as well as beef?—Yes.

2859. Have you found it answer equally well? Yes.

2860. It was prepared in the same way, of course?—Yes.

2861. With regard to the convenience which you have described of carrying the dead meat as against the live meat from America, I suppose that besides the convenience of carriage there is

Chairman—continued.

also this: that the carriage of the live meat for such a long voyage has innumerable risks attached to it?—Yes; and it is more expensive. You recollect that in taking a good fat bullock, you have about 57 to 58 or 60 per cent. of meat, according to how fat the bullock is; the balance is what we call offal. We cannot afford to pay *27 s. 6 d.* a ton for the carriage of the offal, for there is a large amount of that offal that is digested hay, and that is not very profitable when you get it over here.

2862. Therefore, in your opinion, the dead-meat trade will be a continuous trade in preference to sending over live stock from America, which they have attempted, I understand?—Yes.

Mr. *Gillett.*

8 June 1877.

Mr. Richard Hall, called in; and Examined.

Chairman.

2863. I believe you live in Liverpool?—Yes.

2864. Have you been interested in this American dead-meat trade?—No, I have not been interested in it, but I have considered it a very great boon to the public.

2865. What is your occupation?—I am a wholesale butcher, and I am largely interested in the supplying of shipping, and also in the retail trade; and I also have a good many Canadian cattle consigned to me.

2866. In your experience of the trade, have you at all had to do with this new importation of dead meat?—I have only had, I think, about six quarters of it. Some gentlemen wrote to me from the country who were anxious to have it, and one or two of my own customers wrote to me to get them some. That is all, except that I have seen a great deal of it.

2867. From your knowledge and from the experience that you state that you have had of it, are you able to give the Committee an opinion as to the condition in which it arrives?—Yes, I have been frequently offered agencies to take it by Richardson, Spence, and others, and also from Canada, but I declined taking it simply for the reason that it would interfere with my shipping business.

2868. Was it because, having a business of your own, you did not wish to go into a fresh business?—I could not go into it conscientiously with my own business, because I knew that it would not do for supplies for shipping.

2869. But can you tell the Committee, from what you have seen of it, whether you believe that it does arrive in such a condition as to be able to form a good source of supply?—Some of it has arrived in excellent condition, but all of it has been slightly damp, and some of it has arrived in very bad condition.

2870. Are you in a position to say what the cause of that is?—I think from the evidence which I heard the last witness give, if it is to be taken from a slaughter-house 10 miles to New York, that is enough to injure the meat, and there is great risk, I think, in consequence of that.

2871. The last witness stated, as I understood him, that the meat underwent a preparation before it was shipped, the preparation reducing it to a condition of temperature which enabled it

Chairman—continued.

when kept in that temperature to stand the voyage, and, by having been treated in that way, to resist deterioration after it was brought out of that temperature?—It does not; a great re-action takes place. If you will allow me to explain, it is a great boon to the country when it comes in a sound condition, because without it we should have been at a very extreme price; but it only does for a daily supply. I have seen it repeatedly, and I have bought pieces of it and hung it up, and the action of the air upon it in one or two days is very extraordinary; a good deal of it will look like smothered meat.

2872. You have heard the evidence which the last witness gave, and his statement as to his having hung up one of those quarters during the time of his absence in London, and its being perfectly good at the end of that time; your experience does not confirm that?—No, it is quite the opposite.

2873. Do you believe that there will be any possibility, if this meat continues to be brought over, of distributing it through the country, or would the very fact that you have stated prevent the butchers of the districts around large towns coming in for the supply?—When it first came, the agitation was immense throughout the country, and the consequence was that everyone wanted American meat. For instance, one store in Liverpool that was opened was at Compton House in Tarleton-street, and the place and the street was so crowded the first morning (there was an immense supply laid in), that they had to have policemen to keep the street and the shop clear; and a second supply had to be brought in, and it was all sold out by three o'clock; that continued for some weeks, and large demands came from the country in the same way, but they have fallen off.

2874. Those who first brought it into the markets, and took the first two or three cargoes, have ceased to combine to supply themselves with American meat?—They have. In Liverpool, some short time ago, there were eight shops for the exclusive sale of American meat; four of them have closed, and I should think the other four do not do one-half the business; perhaps not more than one-third of what they did. Then again the little butchers, the American meat being so much cheaper than home-killed meat, bought American to mix with their meat. That is

Mr. *Hall.*

Mr. *Hall.*

8 June 1877.

Chairman—continued.

discontinued. Again in a low neighbourhood, such as Marybone, in Liverpool, the greengrocers got it to sell, but that has been discontinued. In the Midland Counties, Mr. Hides, of Sheffield, who is one of the largest cattle dealers that we have, was bound to come down to buy American meat and he could not get enough at first. Coming up the night before last I thought I would write him a note to telegraph me here, and he telegraphs me, "The demand has fallen off, there is scarcely any sold."

2875. You represent that he was at first a large dealer in this particular article?—Yes; he was obliged to come to buy it, because they would have that and not his own.

2876. We have had it in evidence that the general supply to the country has not fallen off; can you account for how it has been maintained?—The only place which I think has maintained the demand, and it is because it has been sold cheaper lately, has been London. I think that everywhere else the demand has fallen off.

2877. Do you know what the prices in London have been?—Yes. I come a great deal to London. I often buy and sell hundreds of cattle here; this day week there was sound American meat sold at 2½ *d.* per pound.

2878. The week before, I think, it was fetching a very much higher rate?—I am not aware of that. I daresay it might have done, but lots of it has been sold at 2 *d.* and 3 *d.* per pound.

2879. That, as the last witness stated, arises from two facts, one that the system is not properly developed and that the preparation of the meat has not been carried out as it ought to have been, and the other that people are at present making experiments in order to send it over as cheaply as they can, and that very often they do not take the precautions that are necessary, and that therefore the meat comes over in inferior condition?—I am told, by practical experience, the temperature in the river at New York, in the summer, is so great that the ice in the vessel fails, and that is the cause of it.

2880. But they have the possibility of getting an almost unlimited supply of ice have they not?—Yes, but they have to pay freight for it. You could not estimate the supply of meat, as the last witness told you, by the bill of entry, because I tried it myself. The tons are measured and the ice is measured in; and of course they do not wish to take more than is necessary.

2881. And in fact there may be some reality in that answer, that it is from attempts sometimes to run as close as possible to the price that the meat has deteriorated, and the prices have fallen to the extent which you represent in London?—No, I think that it has fallen in this way: the people do not care about it as they did. It is splendid meat until you come to cook it. I speak without prejudice, because, as I have already stated, I consider its coming a great boon, because we should have been literally starved if we had not had it. I have cooked it in my own house, and I have eaten it hot, and it was literally good, quite as good as a great deal of our English meat; but when you come to eat it cold it is very tasteless and insipid.

2882. Your personal experience of it is not satisfactory?—To tell you a little more about that, Messrs. Lee and Nightingale, who are the agents for the principal newspapers throughout the kingdom, some little time ago came to me for information with respect to it, and I said: "I have a bit of beef left that I had for my Sunday's dinner, and you can taste it for yourself, and judge." And they sent me word that they concurred in my views, and that they preferred the English beef. But this is a most excellent substitute, no doubt, when it comes sound.

2883. Though you think that it is a very admirable addition to our present supply, you do not believe that it will ever be a substitute for English meat?—I do not believe that it will ever be a substitute for English beef, and I am apprehensive whether it will last to pay them; I hope it may.

2884. That is a question upon which you do not speak, I suppose, with any personal experience?—No.

2885. I suppose that one advantage of the trade with regard to the people of this country is that the offal does not come over with the meat?—No; the offal does not come over, and that offal is what goes into general use for the poorer classes of both Liverpool and all throughout the United Kingdom. The last witness told you about the offal, but he forgot to tell you of the tail, he forgot to tell you of the kidneys, and he forgot to tell you of the head and the tripe; but I do not want to conceal anything from you, and I will tell you everything truthfully.

2886. I understood the last witness to say that those things were utilised for other purposes in America?—He was asked what he described as offal, and he said the fat, the liver, and the heart.

2887. What the last witness said was, that the blood was used as a fertiliser, and the heart and the liver to make sausages; that the bones were reduced to bone-dust to be used in America; that the guts and feet were boiled off, and the residue used as manure?—He did not tell you of the tail, or of the kidneys, or of the head.

2888. It may be possible that the last witness did not mention them because their market there consumed the supply, and that they merely sent the carcase over to this country?—Exactly, because the offal would not keep to come; it would be entirely spoilt. The action of the ice would destroy it, and make it damp; when it got here it would not be saleable at all, and the liver would have to be thrown to the pigs.

2889. I understand that the system under which it comes over is that there is no actual contact with the ice at all, but that the atmosphere is merely kept at a certain temperature by a process of ice pipes, which does not imply any dampness in the actual chamber itself?—It is singular if such is the case that when it comes out it is all damp; I never saw any come out that was not damp.

2890. May not that be the effect of the action of the atmosphere on its first being brought out of the temperature in which it has been kept?—It may be so, but it is all damp.

2891. You say it is impossible to bring offal over; are you aware that offal is brought over to this country, not from America, but from the continent?—No, I am not.

2892. You have not heard that it was stated to a previous Committee in 1873, and that it has been stated also by Professor Brown here, that such is the case, and that offal is brought from abroad, and that it is carried by railroad to the markets

Chairman—continued.

markets in this country, and that it does sell in those markets for food?—I should think that it is totally unsaleable.

2893. You cannot say that it is not the case?—I cannot positively say that it is not the case; but I have had a great deal of practical experience of the business for very many years, and I am not aware of it.

2894. It has never come under your notice that the offal which you have sold has been offal which has come from abroad?—No, never.

2895. And your own judgment is that it could not be so brought, and sold for consumption?—No.

2896. Can you speak as to the shipping interest?—In consequence of the steamers bringing such large quantities, and these gentlemen paying such very large freights to the steamers, the steamers commenced to take the American meat. Of course those gentlemen connected with the trade were anxious to sell it to me, and I told them that I could not do the companies such an injustice; that I would rather lose the business than sell it to them, because I felt convinced that it would not answer their purpose. I am speaking now of the very steamers that bring it; the consequence was that some of them left me without orders, and others gave me an order for perhaps a couple of hundred pounds; now they have come back, and the last order of those that left me without an order was 3,400 lbs., though they could buy the American meat at very much less per pound. Those gentlemen who were in the American trade were desirous to send me American meat to supply the steamers, and I said I could not do the steamers such an injustice, because I knew what it would be, because the American meat after it has been a few days in the ice smells. In one steamer I smelt it, and it smelt just like a corpse, like a body just before the coffin is closed.

2897. That was in consequence of its being placed in ice after it had been transhipped?—Yes.

2898. Would it not be possible for these steamers to fit up for themselves a small refrigerating room in which they could keep their meat?—I do not know that; I am simply telling you the facts as they stand; you may be sure that they would desire to serve these gentlemen, who are very large customers to them.

2899. And the practical result is that, although they would get it at a cheaper rate if they so supplied themselves, they have continued the orders to you to the extent which you have said?—Yes. Then, again, during this week in London, I have it from most reliable authority, that there has been 30 tons of Canadian and American meat together seized.

2900. Do you know where that came from?—I do not know; some of it would come from Canada, and some from New York, I presume; that was this week, and the weather has been comparatively cold this week.

2901. You cannot state where that meat was landed?—I cannot; but it is almost impossible in hot weather to keep meat which is landed at Liverpool to come to London, because you yourself, I dare say, from your experience in travelling on a hot day, when you have even the windows open, find it most oppressive, and what must it be in vans which are closed up? I have bought large quantities of meat in Deptford, and killed it, and brought it to Liverpool, and it would not do; and I have killed it in London and brought it to Liverpool, and it would not do; I sent some to one company, the "National Steam Company," and the consequence was that when the vessel came back a portion of the meat was spoilt, and they deducted 350*l.* from my account; that was the beef of animals which had been rested for two or three days in London before being killed, and then killed and cooled, and brought to Liverpool, and put into the steamer.

2902. But it had not been submitted to a refrigerating process before it was started on the railroad?—No; but no meat will stand much handling, the less it is handled the better.

2903. Especially in hot weather?—Especially in hot weather.

2904. What you would tell the Committee is that you cannot confirm the last witness in thinking that the trade will be established, and that it will supersede in any way the present trade?—I fear that it will not, I hope that it may continue to come in good condition; for meat is a great deal too dear, and it is much better for us to have it cheap. I have a great deal more faith in the live-meat trade. My Canadian friends have been most anxious to send me dead meat, and I have said, "No, do not; it will end in disappointment and loss, and I do not want a commission in a thing that would be a loss to you, because it will be most unpleasant for all concerned."

2905. Have you dealt largely in the live trade from America and Canada?—Yes; the first large cargo that came into London was consigned to me last year. There were a few the year before, belonging to John Bell & Sons, of Glasgow, but they came in rather a wasted condition; they were landed in the Victoria Docks, and they received a great deal of harassment.

2906. Were they from America, or from Canada?—I think they were from America. The first cargo that came in perfect order was landed last June on the Sunday, at Thames Haven, and sold in the London market on the Monday; and the "Times" and all the newspapers spoke of the splendid condition that the cattle came in. There were 102 of them, they came by the "Temperly" line.

2907. I suppose that the length of the voyage makes it a considerable risk whether they come over in good condition or not?—It does. The man that brought them said that they had actually improved on the voyage; they were the theme of admiration in the London market.

2908. They must have had a very good passage?—They looked like a team of hunters coming out of a stable. Last week, in Liverpool, there was a cargo of 101 sold to Mr. Burrell, of London, at 32*l.* per head, and several lots that have come have averaged 35*l.* to 36*l.* per head; last year the trade was only in its infancy, and doubtless it will increase, but I hope they will both increase, because we want them.

2909. Can you give the numbers showing how the live-cattle trade from America has increased since it started?—I can only give you the numbers so far as Liverpool is concerned, though I have had many landed in London also. At Liverpool last year there were only 1,631; this year, up to the 5th of June, there have been 1,574; and I should think that there would be 20,000 landed throughout the United Kingdom this year, most of them of very fine quality indeed.

2910. It

Mr. *Hall.*

8 June 1877.

Chairman—continued.

2910. It is a growing trade, in fact?—A very growing trade.

2911. Can you tell the Committee what is the comparative cost of sending live animals and dead meat to this country?—Live animals must be dearer, but when they get here the meat is much better; you cannot get better meat than the American bullock, and the dead meat would be the same, but it is the ice that draws the flavour of it away.

2912. Have you any figures that you could put before the Committee showing the comparative cost of the two trades?—No, I do not know what their expenses are; I can tell you what are the expenses of the live cattle, but not about the dead meat. There was a cargo of 278 cattle brought the other week by Layland steamer, "Istrian"; had the importer had 300, there was space for 300, and they would have come for 1,400*l.*; but in Montreal they are charging them 7*l.* per head, including fittings. The time was limited, and the importer, who shipped per "Istrian," could only send 278, which all arrived sound alive.

2913. But you may take 1,400*l.* as the cost of sending 300 cattle?—Yes.

2914. That is under 5*l.* per head?—Yes.

2915. Did that include all the expenses of food?—No, they have to pay for fittings and forage; I think you might put it down at 6*l.* per head.

2916. You think that you may take that as the average price?—Yes; then in Montreal they are charging more; the shippers are all anxious to get here with them, and they are competing with each other.

2917. You say that they are competing against each other in price?—All the shippers are anxious to send their cattle here, because they think that beef will rule very dear for the next few weeks; and they all want to come first, and therefore one has been bidding against the other to procure freight.

2918. Therefore that is not perhaps a fair criterion of what the price will be?—No, it is not a fair criterion. I cabled out, some months ago, saying that our grass-beef would be very late, and that the Scotch and Irish beasts would be done very much earlier than usual, and that I was sure there would be a very good market; and it has made them all anxious, and that has raised the markets. The whole of the freights of the Allan steamers are engaged by Bells, of Glasgow, but I do not know what freight they are engaged at.

2919. You cannot give the Committee any notion of what the cost of bringing the dead meat is?—I cannot.

2920. But you represent that the American live-meat which is sent over at that cost has a good market in this country?—It has a good market, and it is very paying indeed. Mr. Snowdon, who sold the 101 bullocks last week, has gone back to bring 300 by the first steamer he can get.

2921. The trade has not been sufficiently long established to test the question of deterioration in really rough weather, has it?—In rough weather there have been losses; there is one firm, the firm of Barber & Coghlan, who were very unsuccessful indeed last year in losses. They were two young men, and they wanted money; and I had to make advances, or, rather, I had to meet their bills; and, after that, they made nearly 2,000*l.*, 1,000*l.* apiece.

Chairman—continued.

2922. You believe that the profits are sufficiently large even to stand the losses that would be likely to occur in consequence of the length of the passage and of the weather?—Yes. There is another question: we are very badly off in Liverpool for lairage; our health committee will do nothing for us. In the first place, when the Canadian cattle arrive, I think that being a British possession, and never having had any disease there, either foot-and-mouth disease, or pleuro-pneumonia, or rinderpest, they should be put on the same terms as the Scotch and Irish beasts when landed.

2923. You would represent that Canada should be treated as a part of the United Kingdom?—Exactly so, as long as they have never had any disease. Instead of that, there is no proper lairage, and they remain on the quay for 12 hours, which frequently does them more damage than the whole of the sea-voyage.

2924. Is there anything else that you wish to say in relation to the question before the Committee?—If there is any other question that you would like to ask me, I shall be glad to answer it.

Mr. *Arthur Peel.*

2925. What effect had the dead-meat trade when it was at its full extent in Liverpool upon the prices of live-meat?—It caused them to be lower, because people considered that the butchers had been robbing them; and the consequence was that they all flew to American meat, and the markets were very languid.

2926. You say that there were eight shops for the dead-meat trade, and that four of them have shut up?—Yes.

2927. What was the class of the shops that was shut up; were they exclusively for the American dead meat?—Yes.

2928. Were they new shops?—Yes, they were open for that purpose.

2929. They were not old butchers who had gone into the American dead-meat trade?—No.

2930. Do you think that the dead-meat trade was treated without prejudice in Liverpool?—Yes; I went to the editor of the "Daily Post" and got him to write about it, because I thought that it was of the greatest advantage to us.

2931. I do not refer to the action of the press, so much as to the action of the butchers?—The action of the butchers who were contracted in their views might be prejudiced.

2932. Did you ever hear of butchers selling inferior English meat as imported American meat?—I have heard of the American people doing it, and I have heard of little butchers doing it also.

2933. Why should the Americans do it?—I suppose that they were short of supplies, and so they bought inferior English and Scotch meat, and it was exposed for sale. I exposed them myself, because I believe in everything being straightforward; they bought inferior English and Scotch beef and old ewe mutton, and sold it as American meat; that occurred in Liverpool.

2934. But you told us that in London last week they sold it at 2*d.* a lb.?—Yes; but I am now speaking of the time when the shops were first opened.

2935. Is any dead English meat sent from Liverpool

Mr. *Arthur Peel*—continued.

Liverpool to London?—A great deal; I have sent a great deal at times, and other butchers have done the same.

2936. By what process is that preserved in the vans?—In the same way as the American meat.

2937. In ice?—No, the English meat is not sent in ice from Liverpool; it will keep well enough for daily supply; it always arrives in good condition if it is sent fresh.

2938. Are you at all apprehensive that if the dead meat trade is established that there will be a greater readiness on the part of the authorities to prohibit the introduction of live stock altogether. If the authorities are satisfied that the dead meat trade is an accomplished fact, do you think that they will be more ready to put restrictions on the importation of live cattle in the event of disease existing in a foreign country?—Doubtless they will. I myself was examined some years ago when rinderpest was rife, and I myself advised the stoppage of the transit of cattle for the time being at the port of disembarkation; it was a great hardship to the working classes, and to the Midland Counties, but that was better than that our herds should be "decimated."

2939. You stated that the live cattle which have been introduced from America were in very excellent condition?—Yes, as a rule.

2940. Do you agree that during some months of the year there is a very great risk and an almost absolute impossibility of introducing live cattle from America?—Not an impossibility, because I believe that they have come nearly every month this year. They could not come of course from Montreal, because the St. Lawrence is frozen.

2941. I suppose that there is a great risk in bringing live cattle?—There is a risk, but they have had very little loss this winter. The National and other companies' boats that are bringing them are very large fine boats.

2942. You think, as a matter of profit, that you would rather deal with the live meat than with the dead meat trade?—Certainly.

2943. As a matter of commission?—There is more commission on the dead meat than there is on the live meat. Any salesman having dead meat to sell has a larger commission.

2944. Precisely; contrary evidence has been given; I only asked you the question to see whether you agreed with that?—A bullock in London is sold at 4 *s.* if it is under 30 *l.*, and they charge 1 *d.* a stone for selling dead beef.

2945. But you are indifferent?—No, I am not indifferent. I would not deal with the trade because I know it would be very cruel to steamship owners to put it on board their vessels, because, supposing that they have a large number of emigrants and passengers, and the meat spoils, they have no backdoor to run out at to get fresh meat.

2946. Do you know any instance in which the passengers have suffered from the meat not being fresh?—I do not; I do not know the cause, because the steam companies are not likely to tell me. I have always been apprehensive of it simply for this reason; that supposing that this meat spoils on the passage, what is to be done? and I apprehend that some of it must have spoiled on the passage or else they would not have returned to me to have given me more money, more particularly when I

Mr. *Arthur Peel*—continued.

am not a customer of theirs, as these American importers are.

2947. Do you know of more than one instance in which complaints have been made by the passengers of the smell of the dead meat from the chambers?—I have not heard of any instances.

2948. You are only apprehensive of its occurring?—I was apprehensive of it from the first, from my practical knowledge that it would be so.

2949. Has it been so?—I do not like asking questions from steamship owners, because it is wise not for me to do so; but one would naturally suppose that they would not come and pay me so much more per lb. after leaving me altogether if the American beef answered their purpose, more particularly when these gentlemen were paying them 700 *l.* or 800 *l.* freight for every voyage.

2950. Do you regard the appearance of "sweating" as it has been termed on the American meat, as a sign of the deterioration of the meat?—The meat becomes very damp and clammy, particularly if it is two or three days old and the weather is bad; and under the flank parts it will be soft and mouldy, and under the suet perhaps it will be spoilt. As for talking about its keeping as long as English meat it is nonsense.

Chairman.

2951. That is an idea of yours?—No, it is practical knowledge, because I have bought it and hung it up and tried it.

Mr. *Arthur Peel.*

2952. Will you explain in detail the actual experiments which you made with the American meat and with the English meat, because the last witness gave us clear evidence of some experiment that had been tried?—Yes, he gave you this evidence: that if English meat is cut up fresh, and it hangs for two or three days, it becomes black outside and dry. If you pass a butcher's shop you will see legs of mutton hanging so, but the meat will be dry of itself, and the American meat will not. The American meat gets discoloured and goes soft and pappy.

2953. Have you seen that yourself?—I have seen lots of it day after day, not in my own shop but in others. I am not at all antagonistic to American meat; I wish it would come in quantity.

Colonel *Kingscote.*

2954. You told us that several of those people who sold American meat in Liverpool had failed or had given it up?—They closed their shops; I do not know that they failed.

2955. Were those people who you said sold this American meat, and who no longer do so, butchers, or had they merely got a new interest and started this as an experiment?—One or two were butchers, and one or two, I think, were not butchers.

2956. In fact they were people who, seeing a new trade, thought they would try and get something out of it, and found that they could not?—Doubtless they did.

2957. Are you aware that American meat has been sold this morning in London at 7 *d.* per lb.?—It is very likely indeed.

2958. How do you reconcile that with the statement

Mr. *Hall.*

8 June 1877.

Colonel *Kingscote*—continued.

statement that it has been sold at 2 *d.*?—That was last week. The market this morning is very bare of all kinds of meat. I dare say there would be some English meat sold this morning at from 8½ *d.* to 9 *d.* per lb. if it has come up in sound condition. Sound meat is sure to sell well.

Mr. *John Holms.*

2959. You have just stated that those persons who had taken up this trade in Liverpool gave it up very soon?—They have only closed within the last few weeks.

2960. Was it the case that the butchers of Liverpool did not care about having American meat at first?—Some of them were prejudiced enough not to care about it, but I hold that its coming was a great boon to the country.

2961. Did many of the butchers take it up subsequently and sell it alongside of their own?—Many of them did.

2962. Would not that account for those new people giving it up?—Not at all, because those butchers have given it up as well as the new people.

2963. You say you do not think that we can depend upon the supply from this source?—I do not think that you can depend upon a safe supply in hot summer weather.

2964. You do not, I suppose, mean that we cannot depend upon a safe supply, because there is not the supply in America?—No, not at all.

2965. Have you studied the preparation of meat on the American side, and also the mode of carrying it over?—Yes.

2966. You do not believe that the system will give us sound meat?—I think that it is dangerous at times, for the reason I told you, that coming down the New York River, the temperature is very high indeed, and the ice is apt to go.

2967. I think you stated that we should have literally starved in this country if we had not had this supply?—It would have been out of the reach of the working classes. We should have had beef, I dare say, at from 1 *s.* to 1 *s.* 3 *d.* per lb.

2968. If the working classes have been saved from starvation by its having come to us, may it not be that we may have a improved supply, so that the better class also may take the meat?—The higher classes of society will not take it up for this reason, that it becomes tasteless. It is quite as tender, and more so, than a great deal of ours, but if you eat it cold it is very tasteless.

2969. But if they improve the mode of bringing it over, so that it may be eaten in this country as well flavoured as it is in America, may not the better classes also in this country partake of it?—Certainly.

2970. You had some importations of live cattle from Canada which you say were sold; at what rate per lb. were they sold?—They would sell at 9 *d.* per lb. live weight, and offal 1 *d.*; the carcases would be 8 *d.*

2971. Prime American meat arriving in a dead state has been sold at what price?—I should think that on the average the American meat, since the trade has been established, has not fetched more than 5¾ *d.* per lb.

2972. Then, practically, that which comes dead is sold a great deal cheaper, two-thirds of the price of that which comes alive?—Yes.

2973. A good deal is made of this question of offal, because a person said that the poor people

Mr. *John Holms*—continued.

do not get the advantage here by dead meat coming that they get by having cattle killed here; are you in a position to tell the Committee precisely the value of each part of the animal if we go through it; could you tell the Committee what you would call the average weight of dressed meat that is produced out of an averaged sized bullock?—The offal that you speak of for the poor is the kidneys, the liver, the heart, the head, the tripe, and the feet; not the tongue nor the tail are used for the poor.

2974. Can you tell us the value of each of those?—Putting it altogether, about 16 *s.* that is sold to the poor.

2975. And what would be the weight of that out of an ox?—From 26 lbs. to 30 lbs., not including tripe, tail, and tongue.

2976. Then it is a great deal less than 5 per cent.?—Yes.

2977. Have you anything to do with the bringing of live cattle from Aberdeen?—No.

Mr. *Norwood.*

2978. You stated, did you not, that you had not considered it consistent with your position to supply shipping with American dead meat?—Yes.

2979. The evidence has been chiefly with regard to supplying the passengers on board ships; would your opinion be equally strong with regard to supplying the crew?—The meat will not take salt.

2980. And you would consider it very wrong to supply a vessel for the purpose of the crew with American meat without distinctly stating that it was so?—I have the largest shipping business in Liverpool, and I have never put a pound of American meat on board a ship yet. I could have got plenty of money out of it, but I would not do it, and I never did it.

2981. Are you aware that imports of live cattle into Southampton are proceeding this very year briskly, and in very prime condition?—Yes.

2982. Are you aware that last week a parcel of live cattle arrived from New York, and was in a condition to be slaughtered the next day?—I am not aware.

2983. Or that horses came, and were trotted the next day in harness?—No, I am not aware of that, but I have seen cattle come out as fresh as out of their own stables.

2984. Do you deal in other foreign cattle besides the American and Canadian?—Yes; I have imported other cattle.

2985. Taking a national, broad view, and not merely that of a large butcher, would it or would it not be a national advantage to prohibit the importation of live cattle from, say, Germany, Holland, and Denmark?—I do not think they could send dead meat in condition; they have no steamers so well adopted as the American vessels.

2986. Supposing that it were contemplated to prohibit by law the importation of live cattle from any part of the world to England, would that, in your opinion, be a national advantage or a serious calamity?—A very serious calamity, because the Germans would not send them, but would find other markets for them.

2987. Have you considered whether the cost of bringing dead meat is not very much greater in proportion to the distance for short distances than

Mr. *John Holms*—continued.

than for long distances?—I do not know that I have.

2988. Have you ever heard, in your experience, of offal being brought here from abroad?—No; I have never heard of it, and I think, if it came, it would sell for very little money.

2989. Supposing that it was not lawful to import live cattle from abroad, but that all meat must come dead, would there be great risk of partially diseased meat being imported here for human food?—Very great risk.

2990. It might really come half diseased; are you of opinion that the conveyance of dead meat is very problematical, and that the prohibition of the import of live cattle from abroad would be a very great calamity?—A very great calamity.

Sir *Rainald Knightley*.

2991. I think you stated that last week the price of American beef in England was 2½ *d.* per pound?—In the London market this day week.

2992. Was that the average price or the lowest price?—I do not think it was the average price.

2993. What was the price of English beef in the market at that time?—Perhaps 7 *d.* per pound, or 7½ *d.* per pound for the best beef.

2994. Then there was a difference of 5 *d.* per pound between the English and the American beef; to what do you attribute that?—Because the American meat came in bad condition, but still it was sound; the inspectors could not seize it.

2995. Still, though the English beef sold at 7½ *d.* per pound, the American beef, which was sound, sold at 2½ *d.* per pound?—Yes; it was as sound as this, it was so sound that the inspector could not seize it.

2996. Do you know what the average price at New York is?—No; but in the case of the bullocks that are bought in Chicago that the last witness spoke of, 1¾ *d.* per pound, it is the live-weight price of them, put on the machine they can weigh perhaps 40, or 50, or 60 together; it is not the dead weight; it is not the carcase.

2997. You attribute the meat coming in this almost unsaleable condition, and having to be sold at 2½ *d.* per pound, to the insufficient and bad arrangements of the vessel?—I cannot tell. I think, in the first place, the slaughter-houses being 10 miles from the port of embarkation, is injurious; and, in the second place, coming down the New York River, with a high temperature, it is very likely that the ice will be lost.

2998. You do not agree with the last witness, that if proper precautions are taken, American meat to any amount can be imported into England quite as sound and quite as good as English beef?—It never can be; or, at least, it must be with a new process; it cannot be by the present system.

2999. Then you differ from the whole of the evidence of the last witness?—Not the whole; I agree with him that very large quantities can come; it is only as to the condition in which it can come that I differ from him.

3000. If American beef is selling at such a low price, it can only be imported here at a dead loss to the importer?—Exactly so.

3001. Are you aware that since this trade commenced, about a year ago, the price of American beef has been gradually increasing?—It has; but I think you will find now that it will

Sir *Rainald Knightley*—continued.

stop. It did rise in price, because the papers had been agitating week after week, and the conversation everywhere had been about nothing but American beef. Now everybody has had it, and I think people are tired of it. I do not think that the price will increase now, because in the Midland districts, Manchester, Sheffield, and Birmingham, the demand is falling off.

3002. The last official returns, I think, were larger than any of the previous ones?—I daresay they might have been.

3003. Does it not appear to you extraordinary that people should import at a loss?—It is a question whether they will continue it.

3004. There they are, and they flourish?—I do not think that they will continue at a loss, and I hope that they will not sustain any more losses.

3005. You say that you have more faith in the live trade; have you ever calculated what is the cost per pound of importing live animals?—Yes; it will be about 2 *d.* per pound.

3006. Do you know what is the cost per pound of importing dead meat?—I do not know, and I do not like giving an opinion upon a matter that I do not know.

Mr. *Torr*.

3007. You said, did you not, that the import of dead meat was problematical, but that in the import of live stock there was not so much risk?—There is a risk, no doubt, in bringing it, but notwithstanding the risk of any loss that they may sustain, the importers have all made money in it, and are increasing their quantities.

3008. How can you say that the import of dead meat is problematical, when it has now been going on for 18 months; you have tasted the meat yourself, no doubt?—Yes.

3009. Can you say that you have never tasted a good piece of American beef?—I do not say that I have never tasted a good piece of American beef. It is very tender and tolerably juicy, but it is short of flavour when hot, and it is very insipid when cold.

3010. What is the highest price at which you have known American beef to sell?—I have known a hind quarter of American beef to be sold in Liverpool at, I think, 7¼ *d.* or 7½ *d.* per pound.

3011. You are connected greatly with retail butchers, are you not?—Yes; but do not supply any of them.

3012. Have you any quotation from retail butchers?—The companies themselves have advertised that they sell the roasting pieces at 8½ *d.* per pound. It has not been so particularly cheap at that, they cut it very long, with immense pieces of suet; they have to do that.

3013. If I tell you that I have myself seen and eaten a piece of American beef that cost 10¼ *d.* per pound, and that I never ate better beef in my life, would you say that that was not a fact?—No; I could not say that it would not be a fact, because perhaps you got it from your own butcher.

3014. No; I got it from one of those butchers of which you are aware there are now several, 10 or 15?—There were never more than eight, and there are four of them now closed. Compton House advertised to sell roasting pieces at 8½ *d.* per lb.

3015. This

Mr. *Hall.*

8 June 1877.

Mr. *Torr*—continued.

3015. This was not from my own butcher, but from one of those American stores; the price paid was 10¼ *d.* per lb., and the meat was in splendid condition. You admit that the damage in a great many instances to this meat has been caused by the slaughter-houses being far from the shipping, and by other drawbacks?—I infer that it is from that; in fact experience tells me that it is from that, and also I should infer that it is from the ice being wasted.

3016. Presuming that those deficiencies and defects were remedied, do you admit that American beef would be imported in a form as good as English beef?—Not with ice; but if they get some other process, it may be. The ice takes away the flavour.

3017. That is when it comes in contact with ice; but you are aware that the beef imported does not come in contact with ice?—I do not know what causes it. The air is drawn from it. If you have a glass of champagne, and you put some ice in it, you see outside the moisture on the glass.

3018. No one knows the beef trade better than yourself; would you not think that it is fair evidence that these men cannot have been losing the money by it that you imply that they have done?—I hope they have not. I do not wish them to. I wish the American beef to come.

3019. Are you aware that the steamers which bring this beef give their own sailors and cabin passengers this beef?—No, quite the contrary on the outward voyage. They did do so, but they have changed; they have come back to us.

3020. I beg your pardon again there. I have been on board one of the Inman boats, and have had a large piece of beef served up to a large party of gentlemen; it had been killed and hung up for 13 days, and not one of them could tell that it was not prime English beef?—You will find out on inquiry that Mr. Inman will not order any to go back with to America for his steamers.

3021. Mr. Inman himself presided at the dinner table; he gave them nothing else, and after the luncheon was over he said, "Now, gentlemen, I give you nothing but this slice of beef, do you approve of it?" and with one consent they all said they never tasted such a fine piece of beef in their lives; and he then said, "Well, gentlemen, this is a piece of American beef taken out of my stores." Nobody knows beef better than you do; are not those facts which contradict your facts?—I can only tell you that I supply Mr. Inman's steamers, and that Mr. Inman does not order beef for his steamers to take back to America.

3022. I think that your principal business is in the supplying of ships?—Yes; and a great deal of retail trade also.

3023. You are the largest supplier of meat to ships, and especially to passenger ships, in Liverpool, are you not?—Yes.

3024. You have never yet ventured on sending any American beef on board those ships?—No; never. Some of them took the business away, and I let it go, because I knew that they would return to their old love; and they did.

Mr. *Assheton.*

3025. Have you ever noticed that if you bring a bottle of iced water into an ordinary dining-room, in a short time the moisture from the atmosphere condenses on the outside, and the bottle becomes wet?—Yes.

Mr. *Assheton*—continued.

3026. Does not that explain to you why, when you take a carcase out of a temperature of 37 degrees, and bring it on to a quay where the temperature is, perhaps, 70 degrees, it becomes moist?—That tells you that the action of the air will cause it to spoil soon. It gets soft and muggy immediately, and the action of the air causes it to spoil.

3027. Do you not see any analogy between bringing a bottle of iced water into a warm dining-room and bringing a carcase of meat out of a cold chamber on to a warm quay?—Precisely. I should like, when our Member is in town, to buy the best piece I can buy; and he shall come and see it fresh, and he shall come and see it in two or three days, and he will not know it to be the same piece.

3028. Does not the analogy of the water-bottle explain to your mind, as it does to mine, why the outside of the beef becomes moist?—There is nothing so destructive to meat as moisture.

3029. That is scarcely an answer to my question. Does not the analogy of the water-bottle explain to your mind, as it does to mine, the reason of the outside of the beef becoming moist?—Yes.

3030. From your experience as a butcher, do you not think that meat carefully killed in America and carefully prepared and preserved in a regular temperature will keep better than beef killed in England in a thunderstorm?—Perhaps it might to use in America, but we do not have so many thunderstorms.

3031. Perhaps you think that they have as many thunderstorms in America as we have here?—Very likely they may have. I do not know.

3032. They say dreadful things of butchers; did you ever come across an instance of a butcher buying tough, lean, old cows, and selling them for American beef to discredit American beef in these markets?—I believe that such things have been done. I believe that it was done in Manchester and other places. I do not know whether it was done to discredit it or not, but they called it American beef. It was so reported in the papers; I do not know whether it was so or not.

Mr. *Jacob Bright.*

3033. You said in the course of your evidence that 30 tons of American beef had been condemned this week; on what authority did you make that statement?—All the seized meat goes to Deptford, and it is put down to boil, and I had it from those who had come from Deptford. It is all weighed on machines there, and then it is put into vessels to boil down.

3034. It is a statement to be relied upon?—Yes, it is a reliable statement.

Chairman.

3035. It is not an official statement?—They are not allowed to give an official statement.

Mr. *Jacob Bright.*

3036. Do you know at what price American beef has been selling to-day in London or in Liverpool?—I do not think much will be selling in Liverpool. One gentleman tells me that it has been sold at 7 *d.* per pound in London.

3037. If

Mr. *Jacob Bright*—continued.

3037. If American beef is selling to-day in London at 7 *d.* per pound, do you know what English beef is selling at in London?—I should think at 8½ *d.* or 9 *d.*

3038. How do you account for that difference in price?—Because the one is so much superior to the other.

3039. Because the one is insipid and the other not?—Exactly.

3040. Is it generally admitted that American beef is insipid?—Yes; when I first tried it I had it for dinner. I would not tell my children that it was American meat, fearing that they would be prejudiced, and I said, "This is very nice." In the evening, after smoking a cigar, I had some for my supper, which was not a fair test, but I said I would test it fairly in the morning. On the Monday I went to market at half-past four o'clock, and I came to my breakfast at 10 o'clock, and then I was quite certain that it was insipid. Then I gave it to Lee and Nightingale, and they tried it, and they thought it was insipid.

3041. It is rather a favourable sign with regard to American beef, is it not, that it sells in London to-day at 7 *d.* per pound?—I do not think that it is a favourable sign. The market is very bare indeed, and this meat may have come in good condition.

3042. There is no prejudice against American beef?—There is no prejudice against American beef if it comes in good condition.

3043. You said that you were a wholesale and retail butcher?—Yes.

3044. Is there any kind of relation between retail and wholesale prices of meat; if the wholesale price declines does the retail price rise or fall?—They usually take the average; of course if things persistently rise in price we should, as retail butchers, advance the price; but if, on the contrary, it lowers, we lower.

3045. Does not the public generally consider that, if the wholesale price rises, the retail price rises; and that if the wholesale price falls, the retail price remains stationary?—Unfortunately the general public always find out when it gets lower, but they never know anything at all about it when it gets higher.

3046. Is it a mistake on the part of the public to suppose that the retail price does not always follow the wholesale price?—It does to a certain extent.

3047. When English beef is selling wholesale at 8½ *d.* per lb., what does it sell at retail?—It is according to the joint. In London you order perhaps a leg of mutton, and they charge you one price, or you order a neck, and they charge you another price, and so on. With us at Liverpool it is all put into the scale together.

Mr. *Jacob Bright*—continued. Mr. *Hall.*

8 June 1877.

3048. What is the difference between the wholesale and retail price when it is all put into the scale together?—The choice parts are about 2 *d.* per lb. higher.

3049. When this sound American beef is selling at from 2 *d.* to 3 *d.* per lb. wholesale, what would it sell at retail?—It would go into the low neighbourhoods, and they would have to get rid of it, and mess it away as they best could. When I say "sound meat" I mean meat which has escaped siezure by the inspector, but not good meat.

Mr. *Murphy.*

3050. You gave some evidence with regard to the number of American cattle imported, and you said that 1,631 cattle last year, and 1,574 cattle this year, have been imported into Liverpool?—Yes; but the live cattle importation last year only commenced when the St. Lawrence opened.

3051. I think you further stated your opinion to be that there would be 20,000 live cattle imported this year?—Yes; into Liverpool, Glasgow, and London. I think that there would be more than that.

3052. Not into Liverpool alone?—No.

Chairman.

3053. I think I understood you just now to say, in answer to an honourable Member, that there was a short supply in London this morning?—Yes.

3054. And that you did not believe that the American meat was selling in Liverpool at the price that it was stated to be selling at in London?—I do not think it would be.

3055. Would you be surprised to hear that since this morning the last witness has telegraphed to Liverpool for 200 quarters to be sent up to the London market, in consequence of the price here, and that the answer has just come stating that it was all sold in Liverpool at a profit?—Not at 7 *d.* per lb.

3056. That proves that the trade is still in existence in Liverpool and is a paying trade, does it not?—There are four shops in Liverpool still.

3057. However, it proves that the trade is sufficient there at all events to carry off the supply; which is slightly contradictory of your evidence?—It is not for Liverpool alone; it would be distributed throughout the Midland Counties as well as Liverpool.

3058. Your previous statement was that that trade had fallen off?—It has fallen off to a considerable extent.

Mr. JOHN DAVID LINK, called in; and Examined.

Mr. *Torr.*

3059. WHERE do you reside?—I reside at Hackney.

3060. What is your trade?—I am an American Beef Agent and a Provision Merchant.

3061. I believe you have had 25 years' experience in the meat trade in London?—Yes.

3062. Do you import beef on your own account?—I do not.

3063. You receive it on consignment?—Yes, I receive it on consignment from New York.

Mr. *Torr*—continued. Mr. *Link.*

3064. How long have you been in the habit of receiving consignments?—I received the first consignment in October 1875.

3065. And you have continued up to this time?—I have continued up to the present time.

3066. Has the trade increased or decreased?—It has increased.

3067. Have your imports come direct to London?—To Liverpool direct, and from Liverpool to London.

Mr. *Link.*

8 June 1877.

Mr. *Torr*—continued.

3068. Not direct from New York to London by steamer?—No.

3069. Would you state to the Committee in what condition that meat has generally been received here?—From October to December 1875, we received several consignments of a few hundred carcases of beef, which arrived in good order and sold at a fair market price, about 6 *d.* per pound for the carcase, that was about the average during the year 1876. I received about 5,000 tons of American meat from New York direct in weekly shipments, some weeks one vessel, and some weeks two vessels. All arrived in good order, and I never lost one quarter of beef until December 1876, when we lost a few quarters of beef which had fallen from the hooks through rough passages, and where thereby damaged. During the year 1877 we have received English shipments from 500 to 1,000 carcases of beef every week, some vessels bringing as much as 550 carcases besides mutton. The Guion Line bring the larger shipments. The whole of the boats of the White Star Line and Guion Lines bring our beef and mutton to Liverpool, and we supply both lines with the beef at Liverpool for the services of their return passages to New York; and during the whole of that time most of this meat has been purchased by butchers in London and consumed at the west end of London.

3070. What is the highest price that you have obtained for it in London?—To-day we have received nearly 7 *d.* per pound for sides for the meat we received; and during the whole of the time we have never lost one cargo of beef, but a few quarters have been damaged by falling from the hooks.

3071. What is the lowest price that you have ever realised?—In October 1876, when there was a very large supply in the market in very hot weather something like three or four vessels arrived, and the shipments came upon the market, a nd theprice through the great supply ruled very low, and the very lowest price that our meat, although it was in good condition, realised, was about 4 *d.* per pound. I might tell you, if you will allow me, that that in October 1876, on my return from New York, having such large supplies from the States, I sought to supply the provinces; I went to Leeds, Manchester, Liverpool, Birmingham, Wolverhampton, Bristol, and other places, and from that time I placed it upon the markets. In the outset, in those large towns, the butchers evidently had a great prejudice against the meat, and other persons outside the trade started in the meat line to supply the public; and when they opened their shops then the butchers at once began to open their eyes, and they began to inquire for the meat; and from that time the butchers have been increasing their trade in purchasing from us at Liverpool.

3072. That is as to the provincial towns?—That is as to the provincial towns; at the present time a large quantity is being sold in Liverpool every week.

3073. You heard the evidence given by Mr. Gillett, did you not?—I did.

3074. Do you, on the whole, confirm that evidence?—I do.

3075. Is there any one special point that he laid before this Committee that your experience contradicts with reference to the condition of the meat, the quantity supplied, and especially the

Mr. *Torr*—continued.

probability of its continuing to be a steady trade?—The being a resident, and being in the trade, would be better able than I am to answer those questions with reference to the supply; but I believe that he is perfectly correct through what I have learnt from my own shippers.

3076. You look upon it as a fixed trade?—I think the American beef trade is an established fact now; as to the quality, I think that is proved by the large shipments that are being consumed principally, as I have said, by the better class of people, who have been consuming it now for nearly two years, many of them not knowing the difference between that and the best Scotch meat.

3077. I suppose the consignor of this beef does not entrust to you the prices that he pays or the prices that he realises; has he ever let you sufficiently into a knowledge of his business to enable you to say that it is a profitable trade?—I could not answer that question; but the shipments increase, and therefore I infer that he is not losing very considerably.

3078. It has been steadily increasing from the time you entered upon it until the present time?—Yes.

3079. You said that you went to New York, did you not?—Yes.

3080. Therefore you know the arrangements made at New York?—Yes, I saw the whole of the arrangements.

3081. Do you think that those arrangements are capable of being improved?—I think that the process adopted by my shipper is the most successful process, and the only successful process, that has carried the meat so well since October 1875. There are various processes used, but they are not so successful as the one which we use, which is a patent.

3082. Does the meat in any case come in contact with ice?—No, it does not; that is to say, it does not touch the ice; it is kept in a cold, dry temperature.

3083. You said that you sold consignments made by those different lines of steamers; I presume that all your beef is landed at Liverpool, and comes to London by train?—Yes; from Liverpool it is sent to the various provincial towns, and likewise to London.

3084. How is it sent?—By train; we have railway trucks constructed on purpose to hang the meat, and a current of air passes through it as it is on its way to London.

3085. So that the condition of the meat is almost exactly the same as it was on board the steamer?—Say that a White Star boat will be in on Monday; we should commence to discharge her perhaps on Tuesday, and we should continue to discharge her if we had sufficient demand; but if the trade is not sufficiently strong, we supply the meat from our refrigerators during the whole of that week, and it arrives in London nearly as bright at the end of the week as at the time we took it from the refrigerator.

3086. When you take it from the refrigerator to place it in the hands of the retail dealers, how long can you rely upon that meat retaining its soundness?—I hear from the salesmen and the butchers that the American meat will keep longer than any town-killed meat; and it is very reasonable to suppose that it will, because it is so prepared that it would be impossible for that meat

Mr. *Torr*—continued.

meat to decompose for days after the hottest weather that we have here.

3087. Can you speak of that of your own knowledge?—Yes, and from what we see. The meat is chilled right through before it is shipped; if it were not properly chilled, then of course it would not keep; but our experience is that it will keep longer than the town-killed beef.

3088. You of course have very frequently eaten this meat yourself?—Yes, and I sent it to Her Majesty; and John Bright has our meat every week, and the Lord Mayor and the Sheriffs, and the city houses, and the clubs at the West End. They all consume our meat, and pronounce it as being the best.

3089. You heard the last witness say, did you not, that universally there is a complaint made against the American beef of its being soft and too insipid; you do not agree with that statement?—When American beef, or English or Scotch beef, arrives at our market in such a condition that it is perhaps only ready to be cooked, it will not look at all sightly; and very often when it arrives in bad order, Scotch beef will realise no more than American meat.

3090. What is the highest price you have ever known realised for American meat in tip-top condition?—For hind quarters we have realised at some very scarce markets as much as 9 *d.* per lb.

3091. And the retail butchers price would probably be 10 *d.* or 10½ *d.* per lb.?—That I do not know. I am speaking now of very rare cases; but the average prices vary, as Mr. Gillett told you, from 6 *d.* to 6½ *d.*

3092. Do you attach almost imperative importance to the condition in which the meat is shipped at New York?—I do.

3093. On that one point the success of the operation mainly depends?—Yes. There is meat in our market to-day that is in very bad condition, although it is sweet; yet it would not realise but one-third of its value. The surface becomes so mouldy and musty that the price realised is very low. That has happened to-day, I know.

3094. That would be good food for ordinary men, would it not?—Yes; if it were sweet and sound.

3095. Would it be healthy food?—I should say that when the surface was taken off, the meat was sweet. It was sold in our market, and passed by the inspector. This would be only just occasionally when a shipment arrives in bad order.

3096. Have you paid any attention to live stock import?—Not any.

3097. Therefore you could not give us any opinion as to that?—No.

3098. Nor do you know the cost per carcase imported from New York?—It is brought by measurement. I could not tell you exactly what the cost is, but I should think it is between 3 *l.* and 4 *l.* per carcase, or not quite so much, perhaps.

Sir *Rainald Knightley*.

3099. I understood you to say in answer to the honourable Member, that American beef coming through New York would keep longer than English beef fresh from a slaughter-house?—Yes, if the American beef arrives in perfect order, as it should if it is properly prepared before it is shipped, it must keep longer; it is a natural consequence.

Sir *Rainald Knightley*—continued.

3100. Then I imagine from what you say that there is no danger of the supply failing us during the hot months?—There is not. Last summer we carried it every week, and the salesmen said that the American beef was the sweetest meat upon the market.

3101. You have heard Mr. Hall's evidence; it is hardly necessary for me to ask you whether you do or do not concur in his opinion, that the American trade is likely to entirely fail, because it is carried on at a dead loss?—Many of those shops that have been started by men not in the trade are being closed, but the butchers are buying the meat now instead of those men.

3102. Then you do not believe that the American beef trade will fail?—No; because the sales are increasing; they have been increasing up to the present time. I suppose that during the extreme hot weather some of the provincial towns will not take so much as they take in the winter, because they do not eat so much meat.

3103. But the supply will increase again you think as the cold weather comes?—I believe that it will.

Mr. *Norwood*.

3104. As to the rate of cost of 3 *l.* or 4 *l.* per carcase, does that include the cost of ice, or is it merely freight?—I merely speak of freight.

3105. It does not include the cost of the engineer who has to attend to it?—No.

3106. Nor the cost of the erection of the safe?—No, nothing but the freight.

3107. I understand that the cost of erecting the safe is borne by the importer?—Yes.

3108. And of course the ice would add to the cost of the freight?—No doubt.

3109. Has there not been some quantity of meat which you have imported seized in London?—Not of the meat that is consigned to me, it comes through a different process.

3110. Not the meat from your special consignor?—No.

Mr. *John Holms*.

3111. Do you know anything about the trade between Aberdeen and this country in live cattle?—No, I do not.

Colonel *Kingscote*.

3112. Did you hear the last witness say that several tons of meat had been seized and condemned in London during the past week?—Many tons arrived in very bad order from Canada, I think, and Philadelphia.

3113. Can you account for that in any way?—Yes, the ice ran out, I believe, so I am told by a gentleman who was interested in it. They had not sufficient ice; the ice ran out, and consequently the meat began to get musty and mouldy and to decompose. Then the vessel was some days longer than usual, and consequently the meat was without ice for several days.

3114. You heard the last witness also say, that the meat is often soft; do you find that that is so?—In wet weather the meat coming out of a temperature of 38° into a temperature of 60° or 70° will of course naturally give, but after a few hours it will become solid again. That is my experience of our own meat.

3115. Have you in your experience ever heard any complaint that it would not salt?—I have never

Mr. *Link.*

8 June 1877.

Colonel *Kingscote*—continued.

never heard any complaint of that kind as to the meat that we have; it does not apply to the meat that I have consigned to me.

3116. Do you supply any ships?—We supply the White Star Line and the Guion Line with the fresh meat from New York, killed about 13 or 14 days previously, and many of our customers at Liverpool supply other vessels as well with fresh meat which they purchase from us.

3117. That is American beef?—Yes, which is really slaughtered in New York.

3118. It comes over fresh and it is taken back again, and you have no complaints of it?—I have heard of none.

3119. Up to the present time?—Up to the present time.

3120. Has the gentleman in America, for whom you are agent, anything to do with the previous witness, Mr. Gillett?—Not at all; he is sole shipper; he commenced the first successful shipment of 42 carcases, in October 1875, and has continued since to increase his shipments, and I suppose he will still continue if we can sell it.

3121. Are you aware of the quantity of American meat that is brought into the London market in the week?—We are having from 200 to 300 tons a week; that has been about our average since last January; I should think there are now about 500 or 600 tons perhaps, varying from 1,500 carcases to 3,000 (they have reached as much as 3,000 carcases) of beef arriving at Liverpool and Glasgow.

3122. Do you think that what is sold in London during a week would equal one day's consumption of the whole metropolis?—In three months we received 7,000 tons of American beef into the Metropolitan Meat Market, which was brought from Liverpool to London; 10 of the shipments came to Southampton, and one or two to the Victoria Docks by the National Line.

3123. Do you think that that is anything like one-sixth of the consumption of the metropolitan district?—I should think not quite; that would be an exceptionally heavy week when we had 3,000 carcases; but I should think it is perhaps one-tenth on an average.

Mr. *Arthur Peel.*

3124. Are the "Guion" and "White Star" boats that bring your meat passenger ships?—Yes.

3125. Have you ever heard any complaints from passengers on board those ships?—I came back with a cargo of meat on board the ship "Celtic"; I saw the meat slaughtered, and dressed, and put on board, and not the slightest offensive smell could possibly come from it.

3126. It is not possible?—It is not possible, of course, if the appliances of ice and everything else are all right.

3127. Are the chambers sealed hermetically?—The chambers are air-tight, and it is not possible for any smell to come from the meat.

Chairman.

3128. I understand you to say that, dating from this experience in 1875, you can tell this Committee that where it fails in being brought over in a condition fit for the market, it is in consequence of the failure of the process by which it is prepared?—Certainly.

3129. And that it is not in consequence of the

Chairman—continued.

atmospheric influence on it here after it is taken out of the chamber?—Not at all, because we have had meat a fortnight here in London after it has arrived and it has been perfectly sweet.

3130. You have been able to send it from Liverpool to London, taking it out of the atmosphere in which it has come over, and yet it has remained fresh in London?—We commenced discharging our vessel on a Monday, and I have had the meat from the same vessel, from a different chamber, upon our market upon the Saturday following, realising very good prices, and in perfect order.

3131. Then, in fact, you have adopted what was suggested as an improvement by Mr. Gillett, viz., having separate chambers so that you can deal with part of your cargo at a time?—Yes, we always have. When the business increased we required to have two or three chambers for the supply, and I suppose we shall have four chambers to convey the meat in.

3132. After having brought the meat from America in those lines of vessels, you send it back for consumption on board the vessels on their return voyage?—Yes.

3133. And you have not had any diminution of that custom in consequence of complaints of its quality?—We have been supplying both companies here for many months. My son resides in Liverpool; I have three sons there to look after the business, and we have been supplying them for many months, and there have been no complaints. I have eaten the beef myself right through the passage, and I was perfectly satisfied; the beef was very good.

3134. You do not agree with the last witness in saying that the meat has no flavour, and that it spoils?—I could show you letters, as I say, from Her Majesty downwards, approving of the meat, and likewise from customers at the west-end of the town, the butchers who sell the meat. Many of the customers of the butchers have not known really but what they have been eating Scotch meat.

3135. And the shipments have steadily increased during this present year and last year, showing that it has been a remunerative trade?—I do not know as to the remuneration; but evidently it pays, I expect, or else they would not increase the shipments; I hope it is remunerative; sometimes I know they meet with very heavy losses.

3136. Of course, if the losses exceeded the gains, the trade would not have continued to the present moment?—The prices are ruled by the demand and supply, and sometimes our market has three or four times as much as it needs, and then the prices go down.

3137. I suppose, by a system of chambers in which you could maintain the meat at its proper temperature, you would obviate that difficulty?—We, as agents, regulate that as much as we possibly can; we watch all the markets round; we have England to supply, and wherever we can realise the highest price we send the meat.

3138. Therefore you would endorse Mr. Gillett's opinion, that the trade is one which will continue?—I believe that it will continue, and become a very extensive trade indeed.

3139. Were you engaged in the meat trade before this American meat was thought of in 1875?—I had been receiving very large consignments

Chairman—continued.

signments of salted meats from my brothers in New York.

3140. You were not in the live meat trade?—Not at all.

3141. And it was only when this idea first started that you began this new trade?—The first consignment was put into my hands to control.

3142. Have you had any cargoes of meat sent over besides cargoes of beef and mutton?—Yes; we have had several shipments of hogs.

3143. Do they come over in as good order as the beef and mutton?—Just as good. Pork was very low in price at the time, otherwise we should have had large shipments of hogs as well. I believe that we might have any number of hogs from the other side.

Chairman—continued.

3144. You believe that the supply of cattle and pigs from America being almost unlimited, the trade will be a very large one?—Undoubtedly.

Mr. *Assheton.*

3145. You described the vans in which you brought the American meat from Liverpool to London; but you did not tell us whether you used any ice?—We do not; it is not required.

Monday, 11*th June* 1877.

MEMBERS PRESENT:

Mr. Anderson.
Mr. Assheton.
Mr. Jacob Bright.
Mr. Cameron of Lochiel.
Mr. Chamberlain.
Mr. Chaplin.
Mr. Wilbraham Egerton.
Mr. Elliot.
Mr. W. E. Forster.
Mr. French.
Mr. John Holms.
Mr. King Harman.
Colonel Kingscote.
Mr. Murphy.
Mr. M'Lagan.
Sir Rainald Knightley.
Mr. Norwood.
Mr. Pease.
Mr. Arthur Peel.
Mr. Ritchie.
Sir Henry Selwin Ibbetson.
Mr. Torr.

SIR HENRY SELWIN IBBETSON, IN THE CHAIR.

Mr. ALFRED LYON, called in; and Examined.

Mr. *Lyon.*

11 June 1877.

Chairman.

3146. I BELIEVE you are the Master of the Butchers' Company in London?—I am.

3147. Have you been long in the wholesale meat business?—About 25 years.

3148. For the whole of that time you have been connected with the business in London?—Yes.

3149. I suppose that, in consequence, you have had very considerable experience both in the purchase and slaughter of the foreign cattle that have been introduced?—I have.

3150. You remember the change that took place in the establishment of the Deptford market?—I do.

3151. Can you tell the Committee whether that made any appreciable difference in the introduction of foreign cattle?—I really cannot say of my own knowledge.

3152. But you have found no diminution in the supplies since that market was established?—I think not.

3153. I suppose you would say that the introduction of live cattle from abroad is material to the supply of London?—Very much so, I should say.

3154. Can you tell the Committee what proportion the trade in London use of the foreign supply?—I can hardly say, because buyers come from all parts of the country. When the cattle market is free a great many foreign cattle are taken from the cattle market at Islington all over the country; therefore I can scarcely say what proportion of them will be left in London.

3155. You mean that when foreign countries are unscheduled, and therefore their cattle can go to the Islington market, a certain proportion go from that market to the country?—Yes, to all parts of the country.

3156. But you would still say that the London consumer is dependent, in a great measure, on the foreign imports?—I should say so.

3157. Has your attention been called at all

Chairman—continued.

to the introduction of the American dead meat?—Yes.

3158. Large supplies are being brought into London from that source, are they not?—Very large. I have some statistics here which prove that. The weight of meat which has been brought into the London Metropolitan Meat Market every week for the first 20 weeks of this year is as follows: In the first week of this year there were 264 tons of American dead meat brought into the London market alone, irrespective of that in the provinces; in the second week there were 339 tons; in the third week, 152 tons; in the fourth week, 169 tons; in the fifth week, 133 tons; in the sixth week, 238 tons; in the seventh week, 215 tons; in the eighth week, 124 tons; in the ninth week, 182 tons; in the 10th week, 115 tons; in the 11th week, 197 tons; in the 12th week, 286 tons; in the 13th week, 275 tons; in the 14th week, 405 tons; in the 15th week, 350 tons; in the 16th week, 495 tons; in the 17th week, 417 tons; in the 18th week, 436 tons; in the 19th week, 611 tons; and in the 20th week, 709 tons. That was for the first 20 weeks of this year. I have had this by me some few weeks now. Expecting to give evidence before this Committee, I asked the clerk of the market to be kind enough to give me the weight of meat brought weekly into the market.

3159. That return would bring us down to about the middle of May?—Yes.

3160. Therefore that shows that it has been a steadily increasing quantity that has been put upon the London market?—I do not know that it exactly proves that, because in some of those heavy weeks the meat was in very bad condition, and the provinces would not take it, and the whole of it was sent to London. A great deal of it came in bad condition, whereas, if it had been in good condition, a great deal more of it might have been sold and used in the provinces.

3161. What happened to this large supply of

Chairman—continued.

709 tons that arrived in the last week that you have quoted?—It was in a very mouldy and bad state, and in a very unsaleable condition.

3162. Did it find a sale?—It found a sale; I believe that a very small proportion of that meat was seized.

3163. It was not seized and condemned?—Only a very small proportion of it, but still the greater part of it was in a very mouldy, clammy, and unsaleable state, and realised very little money.

3164. As a question of profit, it was not probably saleable, but it went into the supply of the meat of the town?—Yes. My opinion of the American meat is that it has been one of the greatest boons that it possibly could have been to the butchers and throughout the country.

3165. Supposing that the trade developed itself, and that this meat were delivered in such a condition as the witnesses have stated to the Committee that it is possible to bring it in, that is to say, in such a condition as the best quality of that meat arrives in, it would form, I suppose, a considerable addition to the supply of food in the town?—It would, indeed.

3166. That being the case, do you believe that a system which seems to be possibly successful with regard to the American trade, could be adopted with regard to the foreign meat supply?—I do not.

3167. Will you give the Committee your reasons for that view?—You remember the evidence of the two witnesses who came before you on Friday, Mr. Gillett and Mr. Link, that the American meat which they send is of very good quality; it is a good thick meat, equal to the best English meat; whereas the Continental supply is a very useful article for secondary purposes. The value of the Continental supply consists in this: bringing the cattle alive, having them to hand, and slaughtering them as they are required, and selling them, as I may term it, with the bloom upon them. I may say that if I slaughtered a very good animal on the Monday in cold weather, every portion of it that is left is worth as much on the Saturday; but if I killed three or four Dutch beasts, or Schleswig-Holstein beasts, or beasts from a great many other countries, they are of that thinness and difference in quality that every day they become of less value.

3168. You mean under the same conditions of temperature?—Under the same conditions of temperature. They become drier and more unsaleable; they lose value day by day even here in our own slaughter-houses.

3169. Therefore you believe that because a foreign animal brought over alive will not keep more than a certain time, the same meat, if brought over dead, would not keep in the way that the American meat would keep, which is of better quality?—I believe it would keep perfectly sweet, but it would not be saleable; it would not fetch the same price; it is a different class of meat altogether.

3170. It would not represent the same saleable article which the American meat, from its quality, does?—It would not; I believe the foreigners could not bring the meat here to have it sold at a price which would pay them, and therefore I believe it would ruin their trade.

3171. You say that you believe it would ruin their trade; but with regard to the supply of

Chairman—continued.

the consumers in London, you say that the foreign meat does not keep so great a length of time in proper prime condition after it arrives, and that the American meat, if it is brought over in really good condition, is a saleable article which will keep?—Yes.

3172. Supposing the American trade to develope largely, and the meat to come in good condition, would the consumers suffer then by the prohibition of the live cattle, the meat of which does not keep for any length of time?—If the Americans could send their meat to be sold at a low price, the consumers possibly would not suffer.

3173. The American meat, as I understand, when it is in good condition, fetches 6 *d.* or 7 *d.* per lb.?—It does, in good condition.

3174. And that is meat which, as I understand you to say, you think is a good saleable article?—Yes.

3175. If that supply could be maintained, would it not really satisfy the consumers, even if the foreign supply which at present exists (an inferior article, as I understand you to say, as regards keeping) was done away with?—If it could be fully depended upon; but that is the point, as to whether the American meat can be fully depended upon; because in the case of this supply you are at the mercy of the winds and waves, and perhaps sometimes for days you get no supply, and at other times you get such a quantity put upon the market, that it can hardly be sold, or only at such a price that I am sure it would be far from remunerative to the Americans to send it.

3176. From your experience, has there been any irregularity in the supply in consequence of the weather, or has not the irregularity in the supply rather arisen from the fact that every now and then you get a very much larger amount thrown upon the market from its being sent up, as you described, not in very good condition from the provinces?—I should think that sometimes the ships are detained by the weather, and then a number of ships arrive at one time. That is my impression, but I could not say positively that it is so, from seeing that for some few days there has been no American meat on the market, and then at another time a very great deal more is brought than can be fairly sold.

3177. I think you said that you were present when the two gentlemen gave their evidence on Friday about the trade?—Yes.

3178. They stated that their steamers arrived regularly, and they gave the dates of those arrivals: two a-week in one instance, and one a-week in the other; did you hear that evidence?—I did not hear that, because I should have judged that if the vessels arrived regularly, the supply would have arrived regularly, which it has not done.

3179. You do not think that that may have arisen from the cause which is suggested now, viz: that the supply is occasionally taken up in the ports where it arrives, and that when it is not in very good condition, they may send it up to London and flood the market?—It may have been so; I cannot say of my own knowledge.

3180. I understand you to say that you think the dead meat would not travel so well from the Continent?—I am sure it would not.

3181. That the expense of the animal, increased as it would be by the amount of cost of

Mr. *Lyon*.

11 June 1877.

Chairman—continued.

this new apparatus, would be so great as to make it an unprofitable trade to the Continental seller?—I think so.

3182. I suppose that the carriage of the dead meat would be less than the carriage of the live animal?—I believe they are very much better off for ice in America than they are in Schleswig-Holstein, and in those countries, therefore I think the live cattle have the advantage.

3183. You think that those difficulties would raise the price to such an extent that it would not be a profitable trade, but would cease, and that therefore we must be dependent entirely to supply the place of the continental cattle upon a settled American trade upon which you could rely?—That is my impression.

3184. Of course, dealing with cattle plague, that is a disease which every one admits is so dangerous, and of which the danger of importation is so great, that restrictions are absolutely necessary to prevent its introduction?—They are.

3185. I suppose your trade would be very much prejudiced by the cattle plague spreading as it did in 1865?—Very much indeed.

3186. With regard to pleuro-pneumonia and foot-and-mouth disease, do you find from the beasts that come under your inspection, and from your knowledge of the importation of Continental cattle, that those diseases are materially introduced from abroad?—I think not. I have had a great deal of experience of that. I have killed many thousands of Continental cattle, and I never saw a case of lung disease in any one instance except in the Dutch cattle, and then in very few instances in fresh imported cattle.

3187. I suppose that, in the animals affected by pleuro-pneumonia, the probability is that a certain proportion, if not all, of those which are diseased, would be stopped by the inspector before they got into your hands?—They have not arrived here; they might be exported; but I have never seen an instance of it. In fact, I may say the Schleswig-Holstein, the Danish, and the Spanish are very healthy cattle indeed.

3188. Your opinion is that the Schleswig-Holstein cattle are, as has been stated by the witness from that country, free from those diseases?—I never saw healthier cattle, and they keep on our hands for days. Sometimes we may buy them, and if the trade is bad we may not want to kill them until the end of the week, and we give them a little hay and water, and they remain as sound as when we buy them.

3189. And that applies also to the cattle from Denmark and from Spain?—Yes.

3190. Is there a large importation from Spain?—Very large indeed.

3191. Is that a growing importation?—I think it has very much increased lately. In consequence of importations from some countries being prohibited, there has been a very large importation going on from Spain and Portugal.

3192. Have you dealt in cattle which have been brought from the scheduled countries, and which have been killed at Deptford?—I have not.

3193. Therefore your trade in foreign cattle has been principally in cattle in the unscheduled countries coming to the Islington market?—It has.

3194. You mentioned something about having had instances of pleuro-pneumonia in Dutch

Chairman—continued.

cattle; will you state what those instances were?—I have seen a few instances of pleuro-pneumonia in Dutch oxen that have been fed with what we term wash feed; beasts that are fed on hot wash; but I might say that I have never seen more than a dozen cases in many year's experience.

3195. Those beasts come from a country where pleuro-pneumonia exists to a great extent, do they not?—Yes.

3196. And therefore there is a greater risk of its importation from that country, than from the countries that you have previously named?—Possibly.

3197. Have you found that any of the cases of pleuro-pneumonia that have come under your notice have arisen from the home cattle that have been sent to the market?—I believe that pleuro-pneumonia has been very bad in our own country during the last three or four years, it is very bad at the present time.

3198. You think that it is quite as much acclimatised in this country, as it is even on the Continent?—I am sure of it.

3199. In regard to eradicating it, do you believe that we could do without the supply if we restricted the movement of animals throughout the country in the way that has been proposed?—I think not. I think that any measure which will interfere with the food supply of the people will be a very bad measure.

3200. Would that materially interfere with the food supply of the people; because it would be only restricting the movement of cattle in those places, and therefore for a time diminishing, to a certain extent, the supply in the Islington market?—I do not know that it would, but I am of opinion that the lung disease has gained such a hold in this country that it could scarcely be stamped out.

3201. You think that it would be impossible, now that it has got so complete a hold over the country, to get rid of it by any repressive measures?—I am afraid that it would take a very long time.

3202. Are you aware that it has been shown to be possible to eradicate it in those countries abroad with which you deal?—Possibly their climate may be better than that of England. I believe that animals are very much affected by changes of climate, the same as human beings are. I have known instances of lung disease breaking out in a place where there was a number of cattle, one animal has gone with it, and that animal has been immediately slaughtered, and there has not been a case again for years.

3203. Do you think that that was really a case of absolute pleuro-pneumonia?—I am sure of it; I saw the animal killed.

3204. From that you would infer that it is not so infectious as it has been represented to be?—I know it is not. There may be 50 or 60 cows in a London cowshed, and they may lose two or three, and all the others will remain healthy. There are places where it will go right through. There is one place in London now where a man has been losing his cattle for two years past, but I believe that that is in a great measure due to its getting fairly into the place, a diseased animal being sent away, and a fresh animal put into the very place almost immediately. I believe there is not half sufficient care taken in such cases.

3205. Do

Chairman—continued.

3205. Do you consider that the regulations with regard to the inspection of foreign cattle and our own home stock, as against the importation of those diseases, are sufficient for dealing with those diseases?—They ought to be. The cattle are landed at a given point, and they are inspected, and allowed to lie so many hours. If there is a case of disease they are sent to Deptford, and there the whole cargo is slaughtered. There have been some cases of particular hardship in sending cattle to Deptford. During the last 12 months I believe that there have been about three cargoes of milking cows, some of which have been just upon the point of calving, and others have calved; cows I may say worth from 16 *l.* to 28 *l.* a-piece; the whole of the cargo was slaughtered, and obliged to be sent into the market as meat, and there they would not realise possibly more than 8 *l.* or 9 *l.*; whereas if there had been a proper place to quarantine those animals, I believe that the foot-and-mouth disease might have been got over in a very short time, and those animals might have been saved.

3206. Then you would be in favour of adopting a system of quarantine with regard to those store cattle?—Yes.

3207. Do you think that it would be possible to carry out a system of quarantine as regards the Dutch cattle which are imported for dairy purposes?—I believe so; I think the Dutch cows are most invaluable in our country.

3208. As being good milkers?—Yes, and they make capital beef.

3209. You seem to know a good deal about the history of these diseases, and therefore I suppose you are aware that pleuro-pneumonia very often takes a long time before it develops itself in the animal?—Possibly it may.

3210. And therefore there is that difficulty about the inspection at the ports, that whilst an animal may pass the inspection satisfactorily, it may nevertheless become a centre of disease if taken for store purposes?—If store cattle underwent a quarantine of seven or 14 days before they were admitted, surely the disease would have fully developed before that time.

3211. You would meet it in that way, by quarantining store cattle?—Yes, I would; and as for cattle for immediate slaughter, they generally do not mix with anything else that they could infect.

3212. You think that the regulations which at present exist with regard to the fat animals that are imported, are satisfactory?—I think so.

3213. You are aware, are you not, that cattle plague was introduced on the present occasion from some defect in those regulations?—Yes; that was rather an unfortunate circumstance, but I believe that it was a grievous mistake on the part of the Corporation of London not to deal more vigorously than they did with those cattle at the time. Although Professor Brown ordered them to be destroyed early the next morning, they were eight days getting rid of them.

3214. You mean to say, that after the order had gone out for their slaughter, a period of eight days elapsed?—A period of eight days elapsed before they were entirely destroyed, and during that time a large number of those cattle died.

3215. But during that time, I suppose, that the place where they were confined was an infected district, and all ingress to, and egress from it, was prevented?—After Professor Brown saw them; but I believe that during the hours after their arrival, before Professor Brown had condemned them, several people saw them.

3216. And in that way the disease might have been carried?—The disease might have been carried by drovers.

3217. But subsequently to the knowledge having come to the department of cattle plague having broken out, although there may have been delay in the absolute slaughter, there was no negligence, was there, in preventing the spread of the disease?—I do not think that it was negligence; I think it came upon them when they were unprepared for anything of the sort. They did not expect a cargo of animals coming in such a diseased state, and I think that stronger measures might have been taken. I have seen many cattle suffering with cattle plague; their breathing is dreadfully hard, and every time they breathe I believe they are poisoning the atmosphere. If I had had to deal with this large number of cattle, I think I should have got a number of navvies and dug a tremendous trench, and killed all the animals and put them in, and covered them up with quick-lime. I think that would have been far better than having the animals there day after day poisoning the air with their breath, because there was such a number to deal with, for the small staff and the condenser which they had at their disposal.

3218. You would be in favour of the system which is adopted in Germany, of always burying diseased animals at once on the spot, wherever it may be?—I think that where the animals are so diseased you could not have too strong restrictions. With regard to the cattle at Limehouse, I happen to have butchered a good many cows for the man on whose premises the disease was first found to exist. I heard that he had 11 cows ill on his premises, and I went down to see what was amiss, and I came to the conclusion immediately that it was a case of cattle plague by the appearance of the animals. Notice was given to the Privy Council to that effect, and during the next 24 hours seven of those animals died. Then they were all removed away to the knackers.

3219. Were any precautions taken with regard to disinfecting people who went near those cattle?—I do not know whether that precaution was taken on the next day, but it was not taken at first. I took particular care myself, and I told the cow-keeper to be careful not to go near any other men who had cattle, and to shut up his own place and not to let anyone go into it.

3220. What would you suggest in order to strengthen our present regulations so as to protect us from such a state of things in the future?—If a cargo of diseased cattle arrived at Deptford, if the disease were in a very early stage, I do not know what they could do more than they did under the circumstances. Mr. Philcox, the superintendent, came to the conclusion in his own mind that those cattle were suffering from cattle plague, and he put them in a place by themselves; but the doctor, on the other hand, I believe, at first almost doubted its being cattle plague; and until Professor Brown saw the beasts the next morning, it was not finally decided that it was a case of cattle plague. The drovers went in amongst the cattle; but still I think that, under any circumstances, if a

Mr. *Lyon*.

11 June 1877.

Chairman—continued.

cargo of cattle is landed and they are ill from any cause, it would be best to shut them up and keep them apart.

3221. All that proves the danger of allowing import altogether, because until the disease is pronounced to be cattle plague people are constantly in contact with the beasts?—Yes; but, on the other hand, the Germans say that it was a mistake to let those beasts come across the country; and if they take the measures which they promise to take, in all probability such a case might not occur again, and I trust it may not.

3222. Do you think that the precautions which may be taken by foreign countries in concert with ourselves, and a little more strictness on the part of our own officials, would render a similar case impossible?—I think so; I think it is to the interest of continental countries to stamp out the disease, and to prevent its coming here, because it is most material to them for us to take their cattle.

3223. I suppose from that that you would tell the Committee that, in your opinion, the only countries that should be treated as scheduled countries should be countries where there was evidence either of there being cattle plague, or of there being a probability of its breaking out?—Yes.

3224. And you think that the other countries should be dealt with, as they are at present dealt with, as unscheduled countries?—I think so.

3225. Did I correctly understand you to say that you think in any case of disease in which there were symptoms of cattle plague, the whole cargo should be immediately destroyed and buried?—Yes; I believe that all this cargo of cattle had the plague, and it was not a case in which there were a few out of the whole number infected.

3226. How would you deal with a herd supposing that cattle plague spread from the port, as in this instance, and broke out in a herd of cattle as it did at Willesden; would you in a case like that destroy all the cattle that were in the yard?—I do not think that it would be safe to leave any alive.

3227. You mean that, whilst destroying and burying the diseased cattle, you would kill and dress on the place, and send into the market for food those that were not affected?—Yes; if they were not affected, and the meat was good.

3228. To summarise your evidence, you believe that whilst cattle plague, if it is introduced, would be very destructive, the last introduction might have been prevented by better restrictions, which probably will be adopted in future; and that there is nothing in that to alarm the country to such a degree as to render it necessary to prevent the import of live cattle from the countries where it can be shown that the disease does not exist?—I think not; I think that people on the Continent have learnt a very good lesson, and I think that we have learnt a very good lesson also.

3229. At the same time you admit that the consumer is not so entirely dependent upon the foreign supply as he was in consequence of the possibility of the establishment of an American dead-meat trade?—Certainly not.

3230. Up to the present time the importation of dead meat has consisted of the meat alone, and offal has not been imported?—Offal has not been imported.

Chairman—continued.

3231. A very large number of people in the East of London depend very much, do they not, upon that article of food?—They do; offal is very largely sold there.

3232. Would the price of American meat, as it is imported, in any way meet the difficulty of doing away with the supply of offal which those people now get from the foreign cattle?—If it decreased the number of cattle killed in this country, in London, it would not meet the difficulty.

3233. But I suppose that these consumers take the offal on account of its price?—A great many poor people live a great deal on the offal; they can go to a butcher's shop, and they can buy a bullock's heart, or sweet breads, and other things.

3234. On account of the price being less?—Yes; they come cheaper than meat.

3235. American meat comes very much cheaper into the market than English meat, does it not?—It has done up to the present time; but if I were asked my opinion, from the experience that I have had of the price that the American meat has made, the gentlemen say that it cannot be remunerative unless they can make about 6½*d.* a lb. of it; if it be so, I would say that up to the present time the American meat that has come to London must have lost many thousands of pounds, because I am satisfied that it has realised nothing of the sort.

3236. But I understand you to say that the explanation of that is, that the American meat which has fetched those lower prices has been meat which has not come in a very good order?—A great deal has come to London in very good order, and has realised a very high price; a very fairly good price.

3237. Supposing the condition of the trade to be so changed that experience enables them to bring the American meat all over in fair condition, it will fetch that price, I suppose?—I should think so, unless there was too much on the market. Of course supply and demand rule the price.

3238. Taking it that 6*d.* or 6½*d.* per pound is the price at which it sells, would that price place it within the reach of the customers who, from the high price of English meat, principally consume the offal?—It might do so in a measure; but the question is, whether, if the London trade were thrown more into the hands of the Americans, the price, with greater exports from America, would not go up there, so that they could not afford to sell the meat so cheaply. Any trade we know, if it is to be carried on, must be made remunerative, and unless the Americans can make it fairly remunerative, they cannot carry it on. I know that it would be a great boon to the poor population, and to the butchers, if it could be brought, because, during the last few years, Scotch beef has got to an almost fabulous price; it has got to a famine price, and this good American meat very materially assists the butcher in his trade.

3239. Is a large portion of the population dependent on the offal of the slaughtered foreign cattle, because, of course, there is always offal from the slaughtered English cattle?—Yes, the offal of all cattle always meets with a ready sale.

3240. The last examination before this Committee really pointed to the fact that a large part

Chairman—continued.

part of the population would be in want of food if the offal from the foreign cattle was not in the market; that condition is to a certain extent altered by the price of American meat, is it not?—It has been lately.

3241. It has been stated by Professor Brown, that the offal is brought from abroad over here and sent to the towns in the country; has that come under your notice?—I have never known a single instance of it, and I think that that is a mistake.

3242. From the condition in which it travels, do you think that it would be possible?—I do not think that offal could be preserved in the manner that meat is preserved, and I do not think that it would be sent.

3243. You do not think that it could be brought over from America by the same system that the meat is brought by?—I think not; take the tripe of an animal, for instance, the value consists in its freshness; it is cooked and sold almost immediately. In the summer time, and in the back end of the year, when the tripe-men have more than they can sell, if they salt it or keep it in any way, when they bring it out for sale again I know it is not so saleable.

3244. Is there anything else that you wish to put before the Committee in your examination-in-chief?—I think not.

Mr. *Chaplin.*

3245. I understand that you think there must have been a heavy loss so far upon the American dead meat trade?—Yes.

3246. What do you imagine has been the average price throughout of that which has been imported?—There has been a good deal seized altogether and lost entirely. One day last week there were 12 tons seized, and another day there were six tons seized. Therefore that was an entire loss, and I know a case of a heavy lot of meat where 200 quarters of beef were sold at 1 *d.* per pound. The meat during that week was on costermongers' barrows, being sold in all parts of the town at anything they could get for it. I should think, from a calculation which was made at the time, that upon the American meat that came to London that week, there could not have been a loss of less than 20,000 *l.*

3247. Do you know to what cargo that 12 tons of which you spoke as having been seized belonged?—I do not.

3248. Do you know when it arrived?—It arrived. I think on Wednesday and Thursday last week. On one day the inspectors told me that they had seized 12 tons, and another day 6 tons.

3249. What is the average price at which beef which is imported alive from the Continent comes into the English market?—I should think that plenty of live bullocks have been sold in the Smithfield-market at fully 6 *s.* a stone as they stood.

3250. How much would that be per lb.?—Ninepence per lb.

3251. Is that the average price at which the beef which is imported from the Continent alive generally comes into the English market?—All the continental beasts would not make so much as that. The American beasts that have come alive have been generally a very good class almost equal to an English bullock.

Mr. *Chaplin*—continued.

3252. What would be the average price in the English market of the beef which is imported from the Continent alive?—I should think that perhaps 8 *d.* per lb. as it stood; in some instances a little more; but it is not such good beef as the American beef.

3253. I understand you say that in your opinion it would pay the Americans well to sell their meat at 6½ *d.* per lb.?—They say so.

3254. What is you opinion about it?—In my opinion, as regards the class of beef of which you have been speaking, which has been equal to the best English beef, it must be a fine country, and they can produce the beef much cheaper than we can in England, if they can afford to sell it so. I have only their word for it.

3255. I suppose the best proof of that would be the price at which they do sell at?—When it gets here it is obliged to be sold; meat is an article which you cannot keep.

3256. I suppose that, unless it paid them, they would not continue to send it?—It remains to be proved whether they will keep on. There are some companies going, and perhaps when they make up their accounts they may not be satisfactory.

3257. Have you seen any of the American beef that has been imported alive from America?—Yes.

3258. What is your opinion of that?—I have seen some cargoes that have come where the beasts have been very much worn by the journey. I have seen beasts lying on their sides so fatigued that they have had to be killed in the market.

3259. Were they in very bad condition?—They were regularly fatigued; nearly dead with the fatigue of the journey and from the sea-sickness, I should think. On the other hand, when they have had a good passage, I have seen them come as fresh as larks.

Mr. *Arthur Peel.*

3260. You gave us 20 weeks' import of meat into the London market; did that include the supply from the provinces?—No; that was only that which came into the London Central Meat Market.

3261. Where did it come from?—From America.

3262. What strikes one in that list is the immense fluctuations, dropping one-half in two consecutive weeks; how do you account for that; did any of this meat come from the provinces?—Most of it came from Liverpool, and was sent on to London.

3263. For instance, in the second week, it was 339 tons, and in the third week it dropped to 152 tons; what would be the explanation of that sudden drop?—Possibly the meat was in good condition, and was bought in Liverpool to go to Manchester, Sheffield, and other places.

3264. I suppose the prices have fluctuated in the same proportion?—Yes; if the meat is in good condition, there is a good trade for it. I believe it might be brought in far better condition than it is, but I think they overpack and bring too much. In some cargoes I have heard of their bringing over 3,000 quarters of beef, whereas if they brought half that quantity, I think they might bring it all in good condition; but that is, of course, a matter for themselves. I

Mr. *Lyon.*

11 June 1877.

Mr. *Arthur Peel*—continued.

think that much of this meat has been spoiled by bringing too much meat in a ship.

3265. Not by sending more meat than we could consume in this country?—No; because I do not know what the price of beef would have been with a regulation shutting out the import from Germany, if it had not been for the American meat imported into this country. I say that it has been of the greatest advantage to this country to have the American meat.

3266. Do you agree with the statement of Mr. Hall, the wholesale Liverpool butcher, that he believed that the American dead-meat trade has fallen off in every town but London?—I believe that when it comes in very bad condition they cannot do with it in the provinces, because some of it looks as if it were covered with a coat of verdigris all over. It has to be washed all over with hot soda and water, and a great deal of it has to be trimmed off, and in the provincial towns they will not have their meat in that state. If you offered a joint of that to a collier, for instance, he would very likely throw it out of doors; whereas in London the poor people get the butchers to trim it up, and when the outer surface is taken off it is very good meat, and it can be sold at a low price.

3267. What is its appearance when it is trimmed?—The appearance is very good.

3268. It has no bloom on it, I suppose?—No; it looks dull from the time it has been killed. All meat which has been killed for a length of time will lose its bloom

3269. But it is sound and good meat?—It is perfectly sound and good meat.

3270. Did I correctly understand you to say that the foreign live stock imported into this country is not of first-rate quality?—It is not. The Americans have acted wisely; they have come here and got some of our best animals, and bred from them and improved their stock. I believe that the American stock is nearly as good as the English, whereas the German and Swedish cattle, and the cattle from some other countries, are a great ungainly bullock, with almost as much bone as meat upon it.

3271. And therefore the American dead-meat trade will represent a better quality of meat than the Continental live meat trade?—A far better quality; the nicest quality of meat from the Continent is the Danish and the Schleswig-Holstein meat.

3272. Why should not Schleswig-Holstein send over the best meat in the shape of dead meat; you say that they are worse off for ice than America, but they are close to Norway?—I have heard them say that ice is dear in Schleswig-Holstein.

3273. You are of opinion that pleuro-pneumonia is acclimatised in this country?—That is my impression.

3274. What regulations would you establish to prevent the possibility of pleuro-pneumonia being imported from abroad; would you propose to do it simply by establishing a quarantine?—For store stock, I should. I believe that some animals will take the disease, and some will not take it; it is just the same as it was with the cattle plague. In 1865, I knew two cases in which we had the cattle plague, and some did not take it. There was a cow-keeper in Southwark named Adams, who had three cows which stood

Mr. *Arthur Peel*—continued.

through it. Before the nature of the disease was known he lost 183 beasts; and those three cows stood right through the disease and never took it, and they got fat afterwards, and I killed them.

3275. You seem to recommend more stringent regulations against the foreign import than against home cattle; what preventitive measures would you adopt with regard to home and foreign cattle suffering from pleuro-pneumonia?—I believe that if an animal is affected with pleuro-pneumonia, the sooner it is killed the better. I do not know that one animal in 500 would get over pleuro-pneumonia, and if it did I do not think it would be of much use afterwards. I have killed animals which have had pleuro-pneumonia and have got over it, and the lung has been like a lump of stone, perfectly dead and heavy.

3276. What would you do with cattle in the provinces or in London, in the neighbourhood of which pleuro-pneumonia is discovered?—I would let it go on. I do not think that pleuro-pneumonia is so infectious that it is necessary to have any such stringent measures with regard to it as are necessary in the case of cattle plague.

3277. Then why are you so anxious to kill them?—Because I belive that if an animal has lung disease it will never do any good, and possibly it might poison others with which it came in contact; but I believe that the best plan is to kill it at once, if it has decidedly pleuro-pneumonia.

3278. Not for the sake of the others?—Not without the others took it; I should not kill the others on account of their having been in contact with it.

Colonel *Kingscote.*

3279. I conclude that your veterinary knowledge is derived from experience, and that you have never studied veterinary science?—No, I have had great experience in the trade. I may say that I have killed something like 500 cows a year out of the London cow-sheds.

3280. Do you find that there is a great deal of pleuro-pneumonia in the London cow-sheds?—There is always pleuro-pneumonia in the London cow-sheds, but I do not believe that it exists to a greater extent there than in other places. I believe that wherever there are cow-sheds in any place, there pleuro-pneumonia would exist at times.

3281. You say that you have killed a great many cattle from the London dairies; were those healthy cattle?—Healthy cattle; fat cattle generally.

3282. But you have killed a good many that were not healthy, I suppose?—I have had a great many sent to me that were not healthy.

3283. Have you killed any suffering from pleuro-pneumonia?—I have killed some suffering from pleuro-pneumonia, and occasionally from foot-and-mouth disease.

3284. Do you think that the London dairies are a great hotbed of pleuro-pneumonia?—I do not, not more so than other places. There is a place on Wanstead Flats now, a nice open country, where cattle ought to be healthy; but one man has had pleuro-pneumonia there for some time, and his things have been under restrictions now for some months.

Colonel *Kingscote*—continued.

3285. You say that you would not kill any animals that were alongside beasts infected with pleuro-pneumonia, but that you would only kill those that were infected?—I would only kill those that were infected.

3286. Are you aware that the disease is said to go on haunting a place?—I think the wisest plan, if it haunts a place, would be to clean the place well, and strip it, and put it under better conditions. A place may be very draughty, and liable to give animals pleuro-pneumonia.

3287. I think you said that, as a general rule, you have not found pleuro-pneumonia in foreign animals; from what countries have those cattle come in which you have found pleuro-pneumonia?—In the Dutch beasts fed on hot wash.

3288. But you have never found it in cattle from Schleswig-Holstein?—I have never seen a case in animals from there.

3289. Do you not think that pleuro-pneumonia might very easily be brought over by the store cattle that come?—Some might possibly have it.

3290. Are you aware that it is a long time lying dormant in a beast before it develops itself?—I cannot say. It tells very much upon the breath of an animal. I should think it is not long before it can be discovered.

3291. You are not aware that veterinary surgeons tell us that it sometimes lies dormant, or, at least, is not to be detected for two or three weeks?—I should hardly believe in veterinary science if it said so.

3292. I think you said that you have not had any personal experience in the dead-meat trade from the Continent?—Yes; a few years ago, when there was a stoppage of cattle, a good deal of meat was killed in Belgium and Germany and sent over dead.

3293. Did it come over in a good state or in a bad state?—It did not make anything like what it would have made if it had come over alive.

3294. Do you see any reason why dead meat which is killed on the Continent, under the same circumstances as the American meat, should not come over here in just as good condition as the American does?—It might be as sound, but it would not be so saleable, because the meat would not be so good.

3295. Do you know any reason why either thinner meat or fatter meat should not be killed and preserved in the same way?—Thin meat would not be so saleable. We generally kill those cattle one day and sell them the next while the bloom is on them; but every day that we kept them, as I have already said, they would become of less value.

3296. Can you give the Committee any idea of the lowest price that it would pay the Continental importer for the meat to be sold at here?—I could not.

3297. Do you think that they could afford to sell it here at 6½ *d.* per lb.?—I am sure that the Continental meat would not make anything of the sort.

3298. Do you mean alive or dead?—It would alive but not dead.

3299. You said, I think, that they would fetch something like 8 *d.* per lb. alive?—I should think on Smithfield stones to-day, good fat foreign cows are making about 8 *d.* per lb. as they stand.

Colonel *Kingscote*—continued.

3300. And you think that that pays?—I believe so.

3301. But if it were brought over as dead meat, you think that it would hot pay them?—I believe not.

3302. What is the weight of a Smithfield stone?—Eight pounds. There is this great advantage in New York; there they can get rid of all their offal, as Mr. Gillet said, and sell it well; but in Schlewig-Holstein there is a very small population, and if the cattle were killed there, the offal would have to come here, and it could not be brought in saleable condition, and I believe that that would result in a great loss.

3303. If you go on importing animals from the Continent, as you are doing now, is there not great danger of the recurrence of an outbreak of cattle plague?—There cannot be any danger at the present time, because we are only importing from countries where cattle plague does not exist and has never existed, unless they should have the misfortune to have it imported. That was the case in Germany, and they soon stamped it out. With regard to Russia, where cattle plague has always existed, I think that this country ought always to shut their cattle out. With regard to Germany, if they allow their cattle to become a source of danger to England, I think we ought to shut them out also; but if they will take every precaution to send their cattle here in a healthy state, I think that it is a bad thing for this country to limit the supply.

Mr. *Anderson.*

3304. Is it only as regards cattle plague that you wish the regulations to apply?—That is so.

3305. Not to pleuro-pneumonia, and not to foot-and-mouth disease?—With regard to pleuro-pneumonia and foot-and-mouth disease, the beasts affected with those diseases undergo a certain quarantine when they come in, which I think is sufficient, because in plenty of cargoes where there has been only one case of disease found, the whole cargo has been sent to Deptford and killed.

3306. The general result of your opinion is that you consider the American dead-meat trade a very valuable adjunct to your trade?—Yes, very valuable indeed.

3307. But you do not consider that it possibly can be a complete substitute for the live-meat trade?—I do not believe that it ever can be a complete substitute for the live-meat trade.

Mr. *John Holms.*

3308. I think you spoke of the great fluctuations in the importations of American meat to London as arising from the fact that the provinces in many instances could not, or would not, take it?—They would not take it if it was in bad condition.

3309. Therefore the only true test of the quantity of American meat arriving in this country is the quantity arriving at the ports, and not the quantity sold in London?—Yes.

3310. Did you mean by the loss of 20,000 *l.*, to which you referred, the value of the meat which was actually destroyed, or did you mean that you believe that the whole transaction with regard to that

Mr. *Lyon.*

11 June 1877.

Mr. *John Holms*—continued.

meat would represent a loss of 20,000*l.*?—I believe that from the great sacrifice at which the meat was sold in the London market a loss of 20,000*l.* was incurred in that one week; everything was brought down to the very lowest ebb; you might say that there was a great deal more meat in the market than was required, and the American meat was in bad condition, and the butchers bought it at a very low price. I have a ticket here: 266 stone of good sound meat sold on the 1st of June at 1*s.* 8*d.* per stone.

3311. What might the consumers pay for it?—The meat came in such gluts at the time that it was sold on costermonger's barrows. Men got vans and horses, and took it down to the Victoria Docks and other parts, and took it into Romford Market, and to all the places to sell it cheap, and they were selling the best joints for 4*d.* per lb., or anything that they could get for it; if they had not done so the meat would have spoiled and come to nothing.

3312. You said that the loss to the poorer classes, especially in the East of London, is very great in respect to the offal which does not come in the case of dead meat; what is the average weight of offal that would be food for the people that would come out of an average-sized bullock?—I have never gone into the weight, but a good fair bullock's heart generally weighs from 7 to 8 lbs. Then there is the tail, and the kidneys, and the skirt, which would weigh possibly 4 lbs. Then the head, of course, is very valuable, and the tripe is very good food when it is properly prepared; and there is the sweetbread, and those little things that are sold as they come hot, you may say, out of the slaughter-house; but I could not give the weight.

3313. You say that in some cases cattle that come by sea, or by railway, are so fatigued that they have to be killed almost immediately; in such cases does not that mean a considerable reduction of flesh meat to the consumer?—I was speaking then of the American beasts that I have seen. The continental cattle are not so long on the journey; they are, perhaps, two days, where the others would be 16 days.

3314. You have had experience both of the continental live cattle trade, and also, I think you said, of the Aberdeen trade; would you say that there was any appreciable reduction of the flesh meat which would practically go to the consumer by the cattle being carried alive, and then being killed here?—There would be in many instances.

3315. Would you say that there was any appreciable amount of decrease of weight?—Some cattle will keep themselves better than others; it all depends upon the state the animal is in. The American beasts are well cared for on their journey, and they come to hand generally in very good condition. Of course, if they have a very rough voyage, they would suffer the same as a human being from sickness and tossing about, and, therefore, they would become ill and lose flesh.

3316. Could you say what per-centage they would lose upon a bad voyage?—No, I could not.

3317. Whatever they did lose in weight would be chiefly in fat, and not in flesh, I suppose?—I believe they lose in both ways.

Mr. *French.*

3318. With regard to these beasts that you say you saw suffering after coming from America, did that affect the meat besides affecting the weight?—The meat would not be in very first-rate condition.

3319. It would not keep so long?—No.

3320. You say that you have seen a good many beasts killed that have been suffering from pleuro-pneumonia; could you tell the Committee about what time a beast may be suffering from the disease before it makes the meat bad?—No, I could not; I have seen them in all stages of the disease. There was a case, last Saturday, where an animal was killed that the inspector condemned; the disease had made inroads into the flesh of the ribs, and therefore he condemned it; but, in the first stage, if the lung had not adhered to the ribs in a manner to strike into the meat, the meat would be good. I should have no objection to eating such meat, and I do not believe that any harm would come from it; but I believe that if the animal is in an advanced stage of the disease, and the lungs adhere to the ribs, and inflammation gets into the meat, then the animal is unfit for food.

3321. With regard to cattle from the Continent, you say that they are not in nearly such good condition as the American meat generally?—A good many of them may be in a good condition, but they are not such a good class of bullock. They are an unwieldy bullock, and a good many of them are very big boned beasts, and they have not the quantity of flesh upon them. The Continental breeders have not studied their breed so much as the Americans have.

3322. I understood you to say that there was not so much fat about them?—There is not so much fat about them generally.

3323. Then, in case they could establish this dead-meat trade, if they arrived in any kind of bad condition, would they be able to stand the dressing, or paring, which the American meat gets?—No, it would be very thin. If the continental meat came in the same condition as the American meat does, it would realise next to nothing, but it would not be so long on the journey. In cold weather it would keep without any preparation.

3324. Have you seen any of the ships in which the meat has come?—I have not.

Mr. *Norwood.*

3325. With reference to the importation of dead meat from the Continent, your belief is based, first, upon the quality of the Continental cattle not being up to the mark, and, secondly, upon the facility of obtaining ice not being so great as it is in America?—They say so.

3326. Have you gone into the question of freight?—I have not.

3327. Are you aware that the freight of live cattle, from Hamburg, for instance, or from Holland, is extremely small, being only about 1*l.* per head?—I believe it is very small.

3328. Whereas the freight on a live beast from America would be about 5*l.* or 6*l.*?—More than that; it would be about 7*l.*, I believe.

3329. Have you taken into consideration that the cost per carcase of bringing over dead meat would be almost as great from Hamburg, or from Holland,

Mr. *Norwood*—continued.

Holland, as it would be from New York?—I have not heard.

3330. The refrigerating safe which they erect on board the ship must be the same, must it not?—Yes.

3331. And therefore it would cost as much to convey the carcases from Hamburg as from New York, as far as the safe was concerned?—The foreigner would first have to pay a royalty on the patent before he could use it.

3332. Then there would be the erection, and then there would be the ice and the attendants?—Yes.

3333. Then, on the other hand, the shortness of the time would have to be considered, which would be a set-off; but can you tell the Committee whether or not it is the fact that the cost of bringing the dead meat in refrigerators would be very much greater in proportion from the near port than from the distant port?—I do not know of my own knowledge.

3334. But you are aware that the cost of conveying the live animals is very small indeed from the Continent, being perhaps about one-fifth only of the cost of conveying them from America?—It is very small; less than that, I believe.

3335. But you would be glad to see all the good meat that could come here in good condition?—I should.

3336. You have no doubt that the importation of dead meat will be better regulated than it has been when everyone becomes better acquainted with it; for instance, from America the glut will not take place to the same extent as before, but they will regulate their shipments?—Time will prove that.

3337. And you are very glad to get all that dead meat, but you would be very sorry to see the exclusion of the live continental meat?—Very. A great many of the foreign animals are sold to Government contractors who are obliged to send in live cattle. To Aldershot, to Chatham, to Portsmouth, and to a great many of the large Government contracts they only take live cattle. At the price at which the contracts are taken they could not afford to send first-rate English beasts; and these good useful cattle, Spanish, Tonning, Schleswig-Holstein, and some few Swedish cattle are sent to supply those contracts; whereas, if the meat came dead into the London market they could not send that meat at all.

3338. And if cattle come alive you can keep them in case of a glut?—Yes, we can regulate the trade much better by having the animals brought in alive than if they are brought in dead.

Mr. *Cameron*, of Lochiel.

3339. Do many of the butchers in London sell this American meat now?—I believe it is sold almost all over London. There are some few butchers who do not use it, but I believe that most of them do.

3340. Is it their practice to draw a distinction in selling their meat between American meat and English meat, or do they let their customers find it out for themselves?—Some customers ask for it, and I believe if they do they can be supplied with it; but I believe that in some instances, if they do not ask for it, they are as likely to get American meat as English.

Mr. *Cameron*, of Lochiel—continued.

3341. At the same prices?—At the same prices, because if it is good it is worth the same price. I am quite satisfied that before the American meat was imported the price of Scotch meat had got to such an extreme height that the butcher would hardly know how to put a knife into it to bring the money again.

3342. Is Scotch beef considered much more valuable than English beef?—It has been.

3343. To what extent retailed per pound?—Some of the West-end butchers got into the way of cutting the Scotch beef, and they fancied that they could cut nothing else until they got the American beef.

3344. Does the same thing hold good with regard to Scotch sheep?—I believe so. I heard last Friday that hind-quarters and fore-ribs of beef were being sold in the London market at 11½ *d.* per pound. I think a butcher is a clever man to get anything out of that.

Mr. *Chamberlain.*

3345. Has the importation of American meat had any effect in lowering the price of English meat?—It has a little.

3346. Do you think that the regulations of the Cattle Plague Act are better carried out by the Privy Council than by the local authorities?—I think they were at the finish. I think the great mistake which was made by the local authorities was when the cattle plague was at the east of London, in only having one officer for the whole of the east and north of London. There were a great many miles to travel over, and before the prohibition was put upon the sheds I believe that a great many removals took place from those places where the disease was which tended to spread it.

3347. You do not think that the regulations which have been imposed by the Privy Council have been unnecessarily strict?—I think not; where rinderpest exists I do not think that the regulations can be too strict.

3348. Have you had any experience of the action of the local authorities outside the metropolis?—At Stratford I have.

3349. But not generally in the country?—No. One or two cases occurred at Stratford, and they drew a cordon of a mile round the place, and would not allow anything to be moved either into or out of it; and therefore they closed with it, as it were, at once.

3350. Do you know anything of the condition of the cowsheds and lairs in London?—I believe that the cowsheds may be very considerably improved.

3351. Do you think that their present condition is a cause of disease?—I should think very possibly that it may be in some instances through overcrowding.

3352. Do you see any objection to putting them under the control of the local authorities, in the same way as the slaughter-houses are?—None at all; I think that is what ought to be done.

Mr. *King Harman.*

3353. Have you ever heard of American meat being sent to Aberdeen and re-imported into London as Scotch beef?—I have heard of its being sent to Glasgow, and then, if it has failed

Mr. *Lyon.*

11 June 1877.

Mr. *King Harman*—continued.

to make a sale there, of its being sent on to London for sale; but anyone can tell American beef from Scotch beef.

3354. Any butcher could, but could any average housekeeper?—I do not know that the average housekeeper could; but if it has been sent from Glasgow to London, it has been sent, I should think, into the London central market. Sometimes, I believe, cargoes have been sent to Glasgow that have failed to meet a demand there, and in consequence they have been sent on here.

3355. And they have commanded a good price in London?—It has all depended upon the condition in which it has come. You never can sell meat that comes in a bad condition at a good price.

3356. Have you any idea of the number of live cattle that are imported into this country as compared with the consumption in the country?—I believe it is about one-sixth.

3357. What do you say is the proportion of the consumption in the metropolitan market?—I could not say; the supply varies very much there.

3358. You say that the foreign beef would not keep as well as the American beef; that is in consequence of its difference in texture and fibre, I suppose?—Yes.

3359. The Spanish beef is a very coarse beef, I believe, with a white fibre?—The Spanish beef is a good thick class of bullock, but they are not good eating bullocks; they are a long way from what you would call a first-class bullock.

3360. Is not a great deal of American beef the meat of Texan cattle?—I do not know; I know that it is of very good quality, come from wherever it may.

3361. How long will the American beef keep in average cold weather after it has been taken out of the refrigerators?—I believe it would keep until the weather comes hot again. I have known meat hung up in our market for an experiment, and it hung there for 11 weeks in moderately cold weather, and it was perfectly sound at the expiration of that time. That was a piece of American meat. I believe that the animal heat is so thoroughly got rid of when it is preserved well, that it will keep for a very long time.

3362. You say that foreign cattle were selling in the market this morning at about 8*d.* per pound as they stood; is that including the offal?—Yes; but there are plenty of good Danish cattle that have realised more than that. I should think that it would fetch 5*s.* 8*d.* per stone; I said 8*d.* per pound with respect to good fat cows.

3363. The plan that you suggested for preventing disease spreading is by means of quarantine; if there were five or six cargoes of suspected beasts you would require a separate quarantining yard for each lot, would you not?—Yes.

3364. Then you would have to disinfect that?—Yes. I think that if cattle were coming for quarantine they might be detained very much lower down the river, somewhere on the coast of Essex. I think that it would be a very good plan for the vessels with foreign cattle on board to be boarded, the same as they are by the Customs officers, a good way down the river, to see whether any disease exists. If an officer had gone on board the "Castor," say down at the Nore, he would have found these cattle in a bad state there, and they might have been sent back again at once.

Mr. *King Harman*—continued.

3365. But supposing that they had been kept in quarantine, would you suggest that the vessel should be kept in quarantine?—If it was proved to be cattle plague, I should. The vessel ought not to go unless it was thoroughly disinfected.

Mr. *Elliot.*

3366. Did you not say just now that the total amount of foreign cattle consumed in this country was one-sixth of the whole consumption?—I have heard so; I cannot state it of my own experience.

3367. Do you not mean that it is 6 per cent. of the whole consumption?—I understood it to be about one-sixth.

Chairman.

3368. Does that refer to the metropolis or to the whole country?—I was referring to the metropolis, but I may be wrong in what I state. It is a question upon which I am hardly competent to give a correct answer.

Mr. *Elliot.*

3369. Do you not think that if the Americans acknowledge that the meat that they send over here will pay at 6½*d.* per pound, it is rather likely that something less than 6½*d.* will suit their purpose?—I do not for that class of meat.

3370. You think that class of meat is very good?—It is very good.

3371. Did you hear a witness say the other day that he had delivered meat at the New York market at 1¾*d.* per pound?—He spoke about the weight of a live bullock. Possibly he might get some of their great raw-boned American beasts which very much correspond to the Swedish beasts; and the weight of meat in comparison with the offal would not at all bear any favourable comparison; it would be very dear even then.

3372. Supposing that it was 2½*d.* per pound in New York, could they not send it to this country for less than 6½*d.* per pound?—I do not believe he meant the class of bullock that they have been sending to this country.

3373. Does it not often happen that our own beef has to be sold at a reduced price, especially when there is a glut in the market?—Occasionally when the weather is very hot, and when there is a larger supply than is required, the salesmen are obliged to sell at the best price they can get; but still I do not remember such sacrifices having been made as have been made with the American beef, because our meat would be in far better condition.

Mr. *Jacob Bright.*

3374. I understood you to say that nearly all the butchers in London sell American meat?—A great many of them do.

3375. Do most of the butchers in the West-end sell it?—A great many of them do.

3376. Then we may be every day eating American beef and mutton without knowing it?—You

Mr. *Jacob Bright*—continued.

—You may be eating beef, but there is very little mutton.

3377. Have you eaten this beef yourself?—I have.

3378. Have you eaten it often?—No, not often.

3379. But enough to test its quality?—Yes.

3380. Is there any peculiar insipidity or want of taste in this beef; has it as much flavour as the English beef?—One piece that I tasted was very beautiful when it was hot, but it seemed not so good as our own meat when it was cold; it seemed to lose its gravy; all the gravy seemed to go out of it after it was cut; but still it was very tender and very nice.

3381. It did not have the same flavour as the English meat when it was cold?—All English meat does not eat alike, you know. I say that, as a rule, American beef is very good food for the people.

3382. You have given us the figures of the imports of this meat into London for about five months?—Twenty weeks.

3383. Can you tell us whether much American meat came to London during the past week?—Yes, there was a fairish supply during the last week.

3384. Was there what you would call an average supply?—Yes.

3385. By an average supply, how many tons do you mean; 600 tons?—No, that is not the average, but there was a good fair supply.

3386. Do you suppose that each week London received anything like 300 tons of American beef?—I should think so.

3387. Last week would test this meat very much, owing to the great heat of the weather, would it not?—Yes.

3388. Did this American meat last week obtain tolerably good prices?—No, a great deal of that meat last week was in very bad condition. On one morning there were 12 tons condemned, and on another morning there were six tons condemned; it was entirely spoilt, and not fit for human food at all.

3389. There have been other weeks when it has been condemned, have there not?—Yes, but that has been through some failure of the machinery, or over packing, or something of the sort.

3390. Do you think that the meat last week was exceptionally bad, or that it was in the average condition that it has been in during the past six months?—It varies very much. On some occasions it comes in very good condition indeed, and on some occasions it comes in very indifferent condition.

3391. Do you know whether the prices obtained last week were satisfactory prices?—I should think not.

3392. You do not know whether the meat sold at a very low price?—Good fore-quarters of beef, last week were selling at 10*d.* and 1*s.* per stone.

3393. I merely asked the question with the view of ascertaining whether the heat of last week had any effect upon the meat?—On Friday morning last there were plenty of good fore-quarters of American beef, good enough for food, too good for the inspector to interfere with, that were sold at 10*d.* and 1*s.* per stone.

Mr. *Jacob Bright*—continued.

3394. When you say that it is in bad condition, but not in a condition to be condemned, is it disagreeable to eat?—I believe that the outer surfaces are uneatable. It requires a good deal of washing and a good deal of trimming. The outer surfaces would be in a very musty condition. There is nothing more objectionable to myself than to get a piece of musty meat in my mouth, and I believe it would be so with the majority of people. When all that must is trimmed away, a quarter of beef might lose five or six stone, and then the body of the meat would be good.

Mr. *M'Lagan.*

3395. It has been given in evidence that the American meat which has been imported here has been insipid; from your evidence it would appear that when hot it is not insipid, but that it becomes somewhat insipid when cold?—I was speaking about the piece that I had tasted. Some of the other might have been different.

3396. I think you said that you had found the same kind of differences in British beef?—Yes, all British cattle do not eat alike.

3397. That may arise from the difference in the age of the animal or from a different mode of feeding?—Yes.

3398. And therefore you say that that is no objection whatever to the importation of this meat?—None whatever.

3399. Would the importation of dead meat have much effect upon your trade, supposing that there was no importation whatever of live stock?—I believe it would render our trade almost unworkable. When the weather is warm, some mornings you require a great deal of meat, and some mornings you require very little. The benefit of a butcher having live animals in his possession is that he can kill them as he requires them for his trade, or go to the market as he requires them.

3400. But you will still have the English cattle for that purpose?—The English cattle without the addition of the foreign cattle would go to a very high price. I think that it would be a very great loss to the people of the country to lose the supply of foreign live cattle.

3401. I understand that it is a matter of great importance to you as a butcher that there should be still an importation of live stock?—I think so.

3402. You have no objection whatever to the importation of dead meat from America?—Certainly not.

3403. But you think that that should not be extended to the Continent?—It should not be extended to the Continent.

3404. And the reason that you give for that is that the beef from the Continent is then in quality not so good as the American beef?—It is so.

3405. And that is the only reason you give for it?—That is the only reason.

3406. And that arises not from the distance that the cattle have to be brought, or from any other circumstance except the breed of the cattle?—That is so.

3407. As I understand from your evidence, the Americans have shown a great deal more energy in improving their stock than the Continental breeders have shown?—They have.

Mr. *Lyon.*

11 June 1877.

Mr. *Lyon.*

11 June 1877.

Mr. *M'Lagan*—continued.

3408. You say that you approve of the importation of dead meat?—Yes.

3409. But you do not wish it to be extended to the Continent because you think that it is necessary to have live-stock imported from the Continent?—I believe that it would put the foreigners in such a position that they would not be able to compete, and therefore we should lose their trade altogether.

3410. But they may improve their stock?—It will take them some years to improve their stock.

3411. Supposing that their cattle were quite as good on the Continent, do you think that it would be a good thing for us then to have dead meat imported from the Continent?—Not to shut out the live-stock, I should say. I believe that a live importation is a most important one to the country generally.

3412. As I understand, it will take 10 days to bring the American beef to this country; it would only take three or four days to bring dead meat from the Continent, and, *cæteris paribus*, there being the same quality of meat in both places, do you not think that we should get better fresh meat from the Continent than we should from America?—I do not.

3413. I am supposing the cattle to be the same?—If they were the same, you would get better meat from the Continent, as a natural consequence.

3414. If, then, the importation of dead meat from America is a good thing, in your estimation, it will be a still better thing to have it imported from the Continent, if the stock was the same?—I do not know that it would. I believe that they might overdo it, so that it would be remunerative to neither party, unless they could bring a regular supply. So much depends upon the winds and waves. At times we should get no supply, and beef would be worth anything that was asked for it; and at another time we should get such a glut that it would hardly fetch anything.

3415. But if you had dead meat imported from the Continent, you would have a far more regular supply than you have from America, would you not?—They would have first to get the machinery; and I do not think, from what I have seen and heard from foreigners, that we should get it at all.

3416. I do not think so either, because of the kind of cattle that they have at the present time, and it would alter their system of agriculture; but we have to look to ourselves, as well as the foreigners have to look to themselves?—Yes.

3417. But you think that if we could get as good beef imported from the Continent as we have imported at the present time from America, it would be a good thing for this country?—I do not; because I tell you that it is a most important thing for the butchers of this country to have the live animals by them, to keep them for the trade, as they require them.

3418. That is for the butchers?—That is for the butchers and for the public. I think that if all the meat were imported in that way dead, we should sometimes get great gluts, and at other times scarcely anything; and sometimes, if the meat came bad, London might go without its dinner altogether.

Mr. *M'Lagan*—continued.

3419. I understand that the freights from America are at present very low, lower than the average; do you know that?—I do not.

Mr. *Torr.*

3420. I think you said that you are the Master of the Butchers' Company?—I am, at the present time.

3421. Is it a guild?—Yes, it is one of the City guilds.

3422. Are you practically acquainted with all the details of the butcher's work?—I have been in business for 25 years, on my own account, as a carcase butcher; I have killed, on an average, 80 head of cattle a week, so that I have some little experience.

3423. And you are a wholesale butcher?—Yes.

3424. You have, I suppose, confined your attention principally to butchering?—My attention has been chiefly confined to buying the cattle alive in the Metropolitan Cattle Market, and likewise at Romford, and slaughtering them for the home trade.

3425. Do you buy, say, 20 or 30 head of imported cattle, and then sell them?—I slaughter them; I do not sell them alive.

3426. Do you keep this stock alive to supply the small butchers?—No; I slaughter them, and sell them as meat.

3427. You have given to this Committee a very wide range of information, I should say, on other subjects rather than on butchering; you have given us the relative costs of the live animals and the dead meat from the Continent, and, in answer to the honourable Member for Hull, you said that you thought it would cost very nearly as much to import dead meat from Hamburg as it did from New York?—I beg your pardon; I did not say that. I said that I had no knowledge of that; I spoke only about the price of the live cattle, and not of the dead meat.

3428. You said that you believe that the live cattle could be imported at about 1*l.* per head; did you ever import any yourself?—No; but I am well acquainted with importers.

3429. We value the evidence which is given before this Committee pretty much in proportion to a man's practical knowledge of the subject?—I do not know anything about the rate at which dead meat is carried from these countries.

3430. Nor, perhaps, do you know the cost of importing dead meat from America?—I do not; and I have stated that I do not.

3431. Nor, perhaps, do you know the reason why these failures have occurred in the condition of the meat, or why some American meat has come in perfect order, and why at other times it has been of such inferior quality as to cause it all to be sent to this market; in the twentieth week, when 700 tons came, you say that it arrived in Liverpool in such bad condition that the provincial markets would not buy it, and in consequence it came to the London market?—Yes.

3432. Would not a large quantity like that, thrown on the London market in one week, naturally prejudice many large London buyers against all that beef?—I am not a London buyer. It certainly did prejudice the buyers, because there

Mr. *Torr*—continued.

there was such a quantity of it. With regard to the condition, of course I know, from those who have told me, that the ice sometimes runs out, and the machinery is liable to break down; and they will be always subject to these contingencies. A rod may break down that cannot be repaired on the voyage, and it may cause a cargo of meat to be spoilt; it is very unfortunate, but it is unquestionably the fact, that it does come to hand occasionally in very bad condition, and sometimes comes as good. I remember last August, in the very hottest weather, a cargo of beef coming in the most capital condition; I have never seen a cargo come in better condition than that.

3433. Then that fact is of value to this Committee, that in the very hottest month of the year American dead-meat was imported and brought into this market in splendid condition?—In very fine condition; and I believe that the weather at that time was very hot in New York.

3434. Does not that prove that beef can be imported in the very hottest weather, and that those other cases are rather exceptions, in the same way as all large trades when they first commence are liable to grievous blunders and great mistakes?—I admit that.

3435. Although that has occurred, do you not think that with fair mercantile knowledge those evils will be remedied?—They may be, but they will always be liable to accident.

3436. That is as you fancy; but you are a butcher, and not an importing merchant, and therefore it is a mere idea on your part that they will be liable?—Yes; I cannot look forward, but I can look backward; I can only state what has occurred.

3437. And you have stated the valuable fact that in the month of August, which is the hottest month of the year, beef was imported in splendid condition. Were you here on Friday?—Yes.

3438. Did you hear it given in evidence by a man who is not exactly in your trade, Mr. Link, that he supplied American beef to the West-end clubs, to many of the noblemen of this country, and even to Her Majesty herself?—He sent a piece to Her Majesty, but I daresay he did not pick a mouldy piece to send, you know. If you wish to see it, I could have brought some pieces here that you would really be disgusted at. But the fact is that they are liable to these difficulties; if the difficulties can be got over it will be so much the better.

3439. It shows that these difficulties can be got over, and that you can have a very superior article of dead meat imported through New York and brought to the West-end market of London, and that it will sell fairly *pari passu* with English meat?—It has been so, and there is no reason why it should not continue.

3440. You laid a great deal of stress on the value of live cattle from the Continent, and you argued chiefly that it is very desirable that the butcher should not have all his stock in the shop of dead meat, but that he should have a reserve of live animals?—Yes.

3441. But against that did you not tell us that you had seen a piece of American beef hung up in a butcher's shop for 11 weeks, and that at the end of 11 weeks it was in fine condition?—No, I did not say that it was in fine condition, I said it was sweet.

Mr. *Torr*—continued.

3442. If you have seen this American beef imported, and in such fine condition that it can be kept for 11 weeks, is it peremptorily necessary that all the butchers should sell their American imports immediately they get them; could they not have a reserve of that imported meat in such a condition that it will carry them over days, and even weeks?—It would all depend upon the condition of the weather. This was an aitch-bone of beef hung up in a very airy place to see how long it would keep, and although it looked very bad at the end of the time, still it was sweet.

3443. When the Americans have perfected their style of importing dead meat, do you not think that the Continental people will be able to avail themselves of the same mode of importing meat much better than they now think themselves capable of doing?—That is a question which it is for themselves to answer; I do not think they could do it.

3444. But you could not give a direct negative to that?—I could not give a direct negative to it; that is a mere question for the people themselves to answer.

3445. You have said what a great damage the recurrence of the cattle plague is to the food supply of the nation; it is not a mere momentary supply of meat to the market, it is a permanent and regular supply, which you yourself want to get?—Yes.

3446. In the early part of your evidence I think some allusion was made to the loss of your trade by the recurrence of the cattle plague?—There is no doubt that in the last visitation of cattle plague it was a very serious loss to the country, because the cattle plague got all over the country. It was rife for several weeks before it was known what the disease was, and during that time it had spread throughout the whole of the country; but, however, with the few mistakes which were made, and which were soon rectified, this time the cattle plague has been stamped out, and the loss will, happily, not be very serious.

3447. Of course you are aware that the primary object of this country importing meat, and our trying to induce the Continental people to send their meat dead instead of alive, is not out of any spite against them as cattle-feeders, or as farmers, but is simply to protect our own herds, and thereby to protect the meat supply for the nation; it is not an individual feeling on the part of English farmers as against Holstein farmers or German farmers, is it?—I cannot help thinking that there may be some feeling on the part of English gentlemen, that if the foreign supply were shut out they would greatly benefit by that; but still, at the same time, we can only take things as we find them, and I say, from my long experience, that the Continental supply is a most important addition to the meat supply of this country.

3448. You said that the want of ice would be a drawback to the importation of deat meat from the Continent; do you know at all how much ice it requires for the import of a carcase from New York?—They would not go by the carcase; they have a chamber, and they have a large supply of ice placed in a certain position, I believe, in this chamber; but I believe that ice can be obtained

Mr. *Lyon.*

11 June 1877.

Mr. *Torr*—continued.

in New York much more cheaply and easily than in Schleswig-Holstein.

3449. You have no knowledge of that fact, have you?—I have heard it discussed amongst gentlemen who have a knowledge of it; and a gentleman will be before you, Mr. Gibbert, who will be able to speak as to that.

3450. Of course New York is a place where ice is largely consumed, and therefore it has become cheaper; and there is no reason why it should not be as cheap in Holstein; you heard the evidence which was given on Friday by Mr. Link and also by Mr. Gillett, that they themselves feel that they have not attained to the most perfect mode of sending beef from America to England?—That is very certain. Take for instance the steamship the "City of Brussels" that broke down recently; there were 1,250 quarters of beef on that vessel, all of which had to be thrown into the sea at a certain point; when they ran out of ice the meat began to smell, and it was valueless. Another cargo pretty nearly twelve months ago came to hand, and was sent on to the London market, but it was nearly all condemned; it was in a very bad condition. It was not a total loss, but it was very nearly so.

3451. Do you know how many days the "City of Brussels" was at sea?—I do not know how many days it was from the time she left New York to the time that the meat was thrown overboard; but I am only mentioning that to show the contingencies which arise, entailing very heavy loss.

3452. Supposing that those animals had been alive, do you think that they would have been able to keep them alive?—If they had had plenty of food, they might have kept them alive.

3453. You are an advocate for importing live animals; those 1,250 quarters would have been equivalent to about 300 bullocks; that ship started with the idea that she would be 10 days on her voyage, instead of which she was about 25 days; if she had had 300 bullocks on board, and had hay and straw sufficient for only 10 days, what would have been the condition of those bullocks; they would have gone overboard long before that, would they not?—I do not advocate the importation of live animals from America as against dead meat.

Mr. *Assheton.*

3454. I suppose they are all fish that come to your net; you do not mind where your beef comes from so long as it comes in good and saleable condition?—Not at all.

3455. Can you give me any information as to the trade in dead meat from Scotland?—I remember the time when the Scotch people could send such a quantity of meat upon the London market that they could put the trade in almost as bad a condition as it has occasionally been with the great import of American meat. I remember that some years ago, the quantity of Scotch meat in the London market was so great that it could hardly be vended.

3456. I am talking entirely of dead meat from Scotland?—I am speaking of dead meat. That will be possibly 20 years ago.

3457. What is the present state of the market?—The importation from Scotland has so fallen off during the last few years, that it is nothing to compare with what it used to be, and the price has gone up in proportion.

Mr. *Assheton*—continued.

3458. What is about the present amount of dead meat per week that comes into London from Scotland?—I cannot say, but it is nothing to what it used to be.

3459. I have not the remotest idea whether it is one bullock or a thousand; is it a train a day or a train a week?—There are several days in the week when Scotch meat comes; you ought to ask the question of a Scotch salesman, but I know it is nothing in comparison to what it used to be.

3460. What sort of condition does it arrive in?—Generally very good.

3461. Does it arrive in as good a condition as the meat that is generally slaughtered in London?—Mostly, unless the weather is very hot, and then it would not be. There is no attempt made to prepare meat in Scotland in the manner that it is prepared in America by a cooling-house, or anything of that sort.

3462. I saw, on Saturday, a train of vans on the Great Western Railway, near Paddington, all marked "meat van;" apparently they were vans made for the purpose of carrying meat; what trade would they be carrying on?—I do not know, I am sure.

3463. You do not know of any dead meat trade that comes into London on the Great Western Railway?—Yes, some of the American meat comes to Bristol, and is brought up that way. Possibly they might have been vans for bringing American meat from Bristol.

3464. You told the Committee that some of the American meat which came to London fetched high prices?—Yes.

3465. Do you suppose that the bulk of that was sold honestly as American meat, or was it sold, I may say, surreptitiously as British meat?—A butcher going into the London central market knows a piece of American meat as well as he knows a piece of Scotch meat.

3466. But, in your opinion, was that meat sold to the eater as American meat, or was it sold as British meat?—I could not say. Some people prefer the American meat, and the butchers would only provide them with American meat if they asked for it. But I should say that, as to a great deal of it, there is no question asked as to whether it is British meat, or American meat, or Scotch meat; a supply is sent in, and it is used, and it gives satisfaction.

3467. Then I gather that you think most of it was sold as British meat?—I should think very probably. There would be no deception, because there would be no questions asked.

3468. When you imported dead meat from Belgium a few years ago, I think I understood that you did not take any means to refrigerate?—No; a great deal came from Belgium and Holland.

3469. You told an honourable Member something about the weight of the offal of an ordinary bullock; can you tell me what is the value of the offal of an ordinary bullock in London?—It varies very much; it would depend on what part you take of it. We consider the hide, the feet, and everything else as portions of the offal.

3470. Will you be good enough, first of all, to specify what you mean by offal, and then to tell me what you think it is worth?—The offal which has been referred to here would mean, I believe, the offal which is consumable as food by the poor

Mr. *Assheton*—continued.

poor in London; that would be the tripe, the liver, the heart, the kidneys, the sweetbread, the skirts, the tail, and the head.

3471. What is the worth of that?—It varies very much according to the size and quality of the animal.

3472. Say that the carcase is worth 20*l.*; what will the offal be worth?—The offal will sell possibly for about 15*s.* or 16*s.*

3473. To go back to the continental beasts, I understood you to say that you had to kill the continental beasts and sell the beef pretty quickly, otherwise it lost its bloom?—It does.

3474. If you killed good British beasts the meat would not lose its bloom, would it, in the same time?—Even if it lost its bloom to some extent it would not be much depreciated in value unless it was kept an unduly long time.

3475. Then may I put it in this way: that the continental beef is of such an inferior description that it must be disposed of quickly or you cannot pass it on to your customers?—You cannot say that it is of an inferior description, because it is a very useful meat; but still it is a thinner class of meat, and it depreciates much more than a thicker and better article.

3476. You told us about some American beef being condemned last week for being in bad condition; I suppose you have heard of some British beef being condemned?—Oh yes.

3477. Was any condemned last week?—I do not know that any was condemned on account of loss by the weather.

Mr. *Wilbraham Egerton.*

3478. With regard to the Deptford Market, was the price of animals there higher than in the Metropolitan Market before the outbreak of cattle plague?—I have never bought any at Deptford, and therefore I cannot say.

3479. Then you are not able to speak about Deptford Market?—No.

3480. Are you able to say whether the offal of animals slaughtered at Deptford is sent into the north?—I cannot say anything with respect to the internal working of the Deptford Market.

Mr. *W. E. Forster.*

3481. Taking the week in which there was the greatest import of dead meat into London, are you able to form any idea what proportion that import would bear to the whole of the meat consumed in London?—I am not.

3482. Have you ever tried to make a reasonable guess as to that?—No, I have not; it is not a thing that I have thought about.

3483. I suppose you would consider that it would have to increase very largely before it would make up for the loss of the present live meat trade?—It would have to increase, decidedly.

3484. You do not deal at Deptford yourself?—No.

3485. Can you tell the Committee distinctly how it comes to be a loss for cattle to be sent to Deptford?—I have never followed Deptford as a market. Finding the other market sufficient, and the things coming, as it were, irregularly to Deptford and being sold at almost any time, I have not followed it to go into the matter; but I believe that there are additional expenses at

Mr. *W. E. Forster*—continued.

Deptford Market, though personally I could not give any information upon the subject.

3486. Is there a railway up to Deptford Market now?—I believe not.

3487. How near to the market does the railway get?—I cannot say; I should think it is something like a quarter of a mile. I have only been to it about once, and then I walked from Deptford Station.

3488. You buy your cattle at Islington; where is your shop, or your office, or your place of business?—In Aldgate High-street, commonly known as Whitechapel Market.

3489. How far are you from Islington Market?—About four miles.

3490. And how far are you from Deptford?—I suppose somewhere about the same distance.

3491. I am not giving any opinion upon the matter, but supposing that all the continental cattle came to Deptford, and that instead of coming irregularly, they came regularly, do you think that then men in your position would attend the Deptford Market?—Yes, but it would shut out a great many of the other buyers; a great many of the small buyers.

3492. Will you explain why?—You will admit that a very valuable portion of a retail butcher's premises is his private slaughter-house. A man can go into the market, and he can buy one, or two, or three, or four beasts, and a certain number of sheep, and he can get them taken home by paying simply for the droving. He has lairage on his own premises, and he can give them hay and water, and kill them just as he requires them for his trade. The same men who work his business at home, who cut up and sell his meat and do his shop-work, kill the beasts, and therefore there is no additional expense on that. If he goes into the Deptford Market, the cattle must be slaughtered within the walls of the market. It would not pay him to take a slaughter-house; he would have to kill in some one else's slaughter-house; he would have to pay additional expense on the beasts being killed in a slaughter-house, or he would have to send for his own men and kill them in the corporation slaughter-house, the men losing, perhaps, the best part of the day in that. Then there is the wear and tear of horses and carts. Then, further, there is a great deal of robbery going on in those places. I have heard of people killing bullocks, and losing a great portion of the offal. Therefore it would shut out a great number of the buyers.

3493. There are a good many private slaughter-houses, are there not, in what you may call the Deptford area?—Yes; they are slaughter-houses let to butchers, but mostly to wholesale men.

3494. What you mean is this: that a large number of butchers who would not carry on sufficient business to take one of those slaughter-houses would be in a difficulty?—Yes.

3495. You yourself, of course, if you attended the Deptford Market, would take one of those shops?—If I found that I could not get sufficient cattle for my trade from Islington and Romford, I might be driven there; but I find it sufficient work at present, without going there.

3496. There was an Act passed, was there not, to put an end to private slaughter-houses?

Mr. *Lyon.*

11 June 1877.

Mr. *W. E. Forster*—continued.

—There was an Act passed to put an end to private slaughter-houses, which came into force, I believe, in 1874 or 1875; but the butchers of London made out such a good case before a Committee of the House of Commons that that Act was repealed, and the slaughter-houses were allowed to continue.

3497. So that they consider themselves pretty safe as regards the private slaughter-houses?—They are under strict rules and regulations. A great many of the worst slaughter-houses have been abolished, and the present slaughter-houses are all under the Metropolitan Board of Works or the Corporation of London.

3498. Take a foreign beast coming, we will say, from Hamburg; what is your opinion as to what that beast would fetch if it was allowed to go into the Islington Market as compared with what it would fetch if it went into the Deptford Market?—That is a question as to which I could not give an opinion, because you will get beasts from 7 *l.* and 8 *l.* a-piece to 30 *l.* a-piece. There is such a great variety in the cost and value of the animal, that I could not give an opinion upon that subject.

3499. You buy foreign beasts yourself, I suppose?—All sorts.

3500. What is the most valuable foreign beast, as a general rule, that goes into the Islington Market?—The Danish and Schleswig-Holstein cattle.

3501. Do you attend the market pretty regularly?—Yes.

3502. Do you find more or less foot-and-mouth disease amongst the foreign animals as compared with the home animals?—I believe less.

3503. Supposing that the importation of live cattle from the Continent was stopped, what effect do you think it would have upon the price of meat?—It would make it very much dearer.

3504. Can you give us any sort of notion as to how much dearer you think it would make it?—No; it would all depend upon the supply; but I believe that anything that prevents meat coming must necessarily make it dearer.

Chairman.

3505. I think you stated, in answer to a question that was put to you, that on the 1st of June American meat was selling at 1*s.* 8*d.* per stone, and was being hawked in costermongers' barrows at about 4*d.* per lb.?—A great deal of it was sold at a great deal less than 1*s.* 8*d.* per stone; at 8*d.*, 10*d.*, and 1*s.*

3506. A large proportion of the meat which was so sold was in very good condition, was it not?—Externally it was not in good condition, but it was sweet.

3507. I understood you to say that when it was properly trimmed it would be good food?—It would be good food when trimmed.

3508. And it did find a sale, I suppose?—Yes.

3509. In that way it was a great benefit to the poorer classes of the district, was it not?—It would be so.

3510. And therefore this trade, if it continued, would, by diminishing the price, tend to be serviceable to the consumer?—There is no doubt that it is very serviceable.

Chairman—continued.

3511. I understood you to say that in your opinion the importation of live cattle was absolutely necessary for the country, in consequence of it being requisite to regulate the trade?—Yes.

3512. Supposing that you could go into the market and be certain of purchasing the dead meat in as good a condition as you have described, would you not be able to regulate your trade in the same way as by purchasing and keeping the beasts?—It is not my trade; I am in a different trade; I am a seller, I am not a buyer; but I believe that the butchers could not at all times depend upon a supply of this dead meat.

3513. What I understood you to say was that for the butcher who slaughtered it was absolutely necessary that he should have the animals on his place, so as to slaughter them as his customer required it?—Yes.

3514. Supposing that he could go into the market and be certain of buying dead meat in the condition in which you describe that it arrives in London, or that some parts of it arrive in London, would he not be able to regulate his trade with the dead meat just as well as he would by having the animals on his own place?—You are getting into the area of supposition. If it were possible for him at all times to be sure of the supply, then it would be so.

3515. You admit that the August cargo that you remember arriving, arrived at a time when the temperature was at its highest?—Yes, and it could not have arrived in better condition.

3516. And you understand that that arrived at a time when the temperature at New York was also very high?—Yes.

3517. Does not that tend to show that if proper care is taken it is quite possible to place upon the market here meat in good condition from America?—Yes; I was told at the time that it was a very light cargo, and that very great care had been taken with that cargo.

3518. At present, I imagine that the trade, being in its infancy, experiments are being perpetually made to see how near they can sail to the wind, so to say, as to profit?—It may be so.

3519. But when once the trade is established, it is quite possible, is it not, that they may deliver in this market a supply of meat in good condition at a fair remunerative price to the sender?—The question again arises whether, if England were too much dependent upon the American supply, the price, like that of the Scotch meat, would not very considerably advance.

3520. Are you aware what amount of foreign import you have been relying upon lately for supplying these butchers who, as you say, depend very much upon purchasing and slaughtering in their own places?—There has been a fair supply of foreigners lately; Denmark has sent a great many during the spring of this year, and even up to the present time.

3521. Are you aware that, in consequence of the restrictions during the last 13 weeks, a larger proportion of the cattle from abroad have had to be slaughtered at Deptford?—Yes.

3522. And that, consequently, to that extent, the market has been dependent either upon the dead meat trade or upon the English market for the supply of cattle to be taken home for slaughter?—I believe that there have been many sheep at Deptford during the last few weeks, but that

Chairman—continued.

that the supply of horned cattle has been very small.

3523. The last return shows 969 slaughtered at Deptford, out of 1,464 imported from abroad; that shows, does it not, that at present you are almost dependent upon the Cattle Market for this supply which you say is necessary to the butcher's trade?—Yes.

3524. And that the foreign cattle supply, in consequence of by far the greater portion being slaughtered at Deptford, cannot meet this necessary requirement of the trade?—No, I believe that many of the Danish cattle are now sent to Newcastle, because there they can go free.

3525. The Danish cattle can go free in London, can they not?—Only within the metropolitan area.

3526. But they go to the Islington Market; they are not necessarily sent to Deptford for slaughter?—No.

3527. I suppose that the foreign import is at its height when the Schleswig-Holstein cattle come in?—It is.

3528. An that is between June and October?—From the back end of June to November.

3529. But during the other months when they do not come here, and for some months the trade has been very materially dependent either upon the dead-meat trade or upon the Islington Market, has it not?—Yes.

3530. Is there any difference in the time when the fat cattle come into the Islington Market?—At the back end of the year we always get a much larger supply than at any other time; that is to say, at the same time as the Schleswig-Holstein cattle are coming; we have a large supply from the grazing districts of Leicestershire. We generally have a much larger supply during the autumn months of the year.

3531. Then, in fact, in the autumn months of the year you seem to have the general supply both from the Continent and from our own grazing districts?—Yes, from Leicestershire, and from Northamptonshire, and those parts.

3532. How do you regulate the trade in those other parts of the year when you are not in possession of either the home supply or the foreign imported supply?—At the other part of the year we have the beasts from Norfolk and those counties.

3533. But during the hot weather, when it is most necessary that you should have cattle, as you say, to stand in the lairs for slaughtering according to the wants of your consumers, you have the least supply in the market?—We get a fair supply. They have just begun to-day; I have seen some cattle out of the Essex marshes on the market to day. There are very large tracts of land in Essex where the cattle are grazed. As one supply falls off, another seems to come on.

3534. But those come into the Islington Market, and do not affect the question as to the import of foreign cattle?—No.

3535. And whilst you have been now for some time in a great measure without that foreign supply, in consequence of the restrictions, you have been dependent for the regulation of your trade upon the supply of dead meat which has been thrown into the market?—Yes, and the other countries which have been supplying, have sent, I believe, more largely. I think it will

Chairman—continued.

be found that Spain has sent a much greater number.

3536. The total import of cattle during the quarter ending March, was 7,054, and of those, 457 went to Deptford; so that there is no great increase of foreign import?—There is no doubt that the American meat made up the supply.

3537. You believe that the American meat has come in very opportunely, at a time when the foreign supply has been practically stopped or restricted to slaughter at Deptford?—Yes; with the restrictions that we have had since last January, if it had not been for the supply of American meat, the price of meat must have been very materially increased.

3538. And that price has been kept down, and in some instances the consumer has benefited to the extent that you have described to the Committee?—No doubt.

3539. Supposing that to have been the case up to the time that you have just mentioned, does it not appear to you that it might be possible, if you could make the American dead-meat trade a continuous trade, to go on still without a very large amount of import from abroad?—I do not think that it would be just to foreigners. I think that we are almost as much indebted to foreigners for years past in grazing and feeding, and sending cattle to this country as we are now to the Americans.

3540. That is another point altogether. You say that, by the introduction of American meat, you have, for a certain period, been able to supply the consumers in London, although the import from abroad has been to a great extent closed, and a large proportion of that which comes has been slaughtered at the port?—Yes.

3541. When I ask you whether that being the case, if the American meat becomes a continuous supply, you will not be able to do so, you do not answer that it is impossible, but you say that it would be hard upon the foreign trader?—I think that if you shut out the continental supply, you would find that the American supply would very much go up in price. I do not think that an American is a bad tradesman, and I do not think that he would send to this country for a small profit, if it is possible to get a large one.

3542. At the same time, you are aware that the prices have not gone up during the year and a quarter that the American dead meat trade has been a continuous trade?—No; circumstances have not given them an advantage, but I believe that, if circumstances gave the Americans and their salesmen an advantage, they would be quite as ready to take the advantage as Englishmen.

5343. There was a question put to you, in answer to which you said that you yourself thought that the American meat was very good when hot, and you agreed with the witness who has already stated to the Committee that when it was cold it was not so good?—I did not find any fault with it when it was cold, but it seemed to me almost flavourless.

3544. You have also stated to the Committee now that you believe that a very large number of customers in London are being supplied with American meat because no questions are asked, as I think you said, and that American meat is sent by butchers to a very large number of people as English meat?—That is my opinion.

3545. Have

Mr. *Lyon.*

11 June 1877

Chairman—continued.

3545. Have any complaints come to your knowledge from customers as to the condition, or flavour, or quality of this meat?—No; but I believe that a great many gentlemen having large households in London have a joint of beef on the table, and they do not ask for it to come on cold, and in all probability they do not taste it cold, but it goes away to the servants.

3546. Do you not believe that the servants, the terror of all households, would probably find out if it was not as good as English beef?—I believe that it is as good.

3547. Then you admit not only that the American meat is as good as the English meat, but that it has met the want which has been created by the stoppage of the import of foreign meat?—I believe that we are very much indebted as a community to the Americans for having sent it.

3548. You are aware of the condition in which the American meat comes to the port to which it is sent; that it comes in a chamber in a certain temperature which preserves it in a condition for the market?—I should think that a great deal of it becomes spoilt in that chamber; it would be impossible for the meat being brought in a ship to Liverpool, and then being brought only from Liverpool into our market, to get into that condition between the time when it is brought out of the ship, and the time that it is brought into the market. I believe that a great deal of it came into that condition from adverse circumstances in the chamber, through its being packed too closely, and the air not being allowed to work freely around it.

3549. The cargo, that I understood you to say arrived in August in such perfect condition, came in one of those chambers, did it not?—It did.

3550. And you attribute its being in such good condition to the fact of its having been properly treated before it started?—One of the gentlemen connected with it at the time, told me that it was a very light cargo, and that they had taken very great care of it

3551. And great care having been taken, it was brought over in good condition?—It was in beautiful condition.

3552. Do you not think that by establishing arrangements, say, at Smithfield, or at other places which are centres of trade, so that the meat might be brought from abroad in that chamber, and be carried to one of those centres in the chamber in which it had travelled, and from which it could be taken out as the supply required it, you would be able, in a great measure, to get over the difficulty which you have described, of a small butcher fearing that he would not be able to supply his customers in hot weather?—I do not suppose that it would be possible to bring the chambers out of the ship with the meat in them; that is a question for the American importers themselves.

3553. If it were possible that they could so arrange the process as to deliver the meat on the London market in the temperature in which it had been carried over, it would be able to remain there, would it not, without being exposed to changes of atmosphere until it was wanted for consumption?—If it was in good condition when the box was opened, of course it would.

Mr. *Ritchie.*

3554. Did I correctly understand you to say, in answer to a question which was put to you by the right honourable gentleman, the Member for Bradford, that you found more foot-and-mouth disease amongst English cattle than amongst foreign cattle?—I did.

3555. Is that the present state of things?—I do not believe that there is any foot-and-mouth disease about now; I have not seen any for some time.

3556. Of what period were you speaking?—I was speaking of the early part of the year, soon after Christmas; I believe that a good deal of foot-and-mouth disease is brought into this country by the Irish cattle. It seems to me that the Irish cattle travel a good deal between fairs and markets before they are shipped and come to Bristol; and I believe that we have more foot-and-mouth disease amongst imported Irish cattle than amongst any cattle.

3557. As a matter of fact, foreign cattle affected with foot-and-mouth disease are not allowed to come into the London market, are they?—They are not.

3558. Do you believe that the slaughtering of the cattle at Deptford would have any effect upon the price to the consumer?—I do not know that it would. I could not say that it would not materially raise the price, certainly.

3559. Would it not, perhaps, rather have the effect of lowering the price to the consumer because of the additional safety that it would give to home-grown cattle?—I do not know that it would give additional safety.

3560. Not if the cattle were slaughtered at the point of debarcation?—I do not think so, because my opinion is that the health of foreign cattle contrasts most favourably with our own.

3561. But we know that it is a matter of fact that cattle disease comes here?—I do not know that. That is a theory which is now set forward, but do you think if there were no importation of foreign cattle, all disease would be shut out? I think not; I think our cattle would always be subject to some disease.

3562. Supposing that we take it for granted that disease is imported by means of foreign cattle, the less you move them about in this country the better it is for our own cattle, I suppose?—Yes, if they are diseased.

3563. Therefore, if it be a fact that disease is imported by means of foreign cattle, it would be to the advantage of our own cattle that foreign cattle should be slaughtered at the point of debarcation, would it not?—If there were any great fear of the disease being carried amongst them, it would.

3564. You said, did you not, that it might, perhaps, inflict some injury upon the smaller men to have cattle slaughtered at Deptford?—It would shut them out from the trade; they would not go there; they could not carry on business under such circumstances.

3565. What proportion do they have to the whole body?—I should think that they have a very large proportion.

3566. You made one statement which I should like you to explain; you said that the importation from Scotland had fallen off tremendously; is that so?—It is so.

3567. Can you give any reason for that?—It has been going for years. I should think that the

Mr. *Ritchie*—continued.

the consumption in Scotland is much greater than it used to be years ago; I believe that is one great reason.

3568. Are you aware what was the price to the consumer before the outbreak of cattle plague in 1865?—I am not.

3569. You do not know what comparison the price at that time bears to the present price?—I do not.

3570. You were going to give me the reason for the importation from Scotland having fallen off?—I believe the consumption in Scotland is much greater than it was 20 or 25 years ago. I believe that is one great reason.

3571. You do not think that the various diseases that have been prevalent have at all affected the breeding of cattle in Scotland?—I think not.

3572. But you do not know, I suppose?—I do not know; I have never heard anything of the sort, and I come in contact with men who would know.

Mr. *Lyon.*

11 June 1877.

Mr. George Rea, called in; and Examined.

Chairman.

3573. I believe you are a farmer holding a very large acreage?—Yes.

3574. Can you tell the Committee what the extent of your operations is?—I farm something like 4,000 acres of valuable ploughable or tillage land, and 1,000 acres of pasture or feeding land.

3575. Is the grazing land mixed with the arable?—No, it is old feeding land. The grazing land mixed with the cultivated land I consider as cultivated land; it comes in its rotation.

3576. Your farms are in the north, are they not?—In Northumberland, and in Scotland, and in Lancashire.

3577. Then you have large sheep pastures, too, I believe?—Yes.

3578. To what extent?—I suppose that the extent of the hill pasture that I occupy is something like from 70,000 to 80,000 acres. I have a sheep farm in Scotland of 10 or 12 miles square; I do not know the exact measurement of it.

3579. Will you give the Committee the number of head of stock that you have?—I have something like 12,000 breeding ewes, and of course the younger ages corresponding to produce that number. I have about 4,000 young ewes, ewe-hogs, or gimmers coming on to be ewes, and their lambs at the present moment; and a proportion of older sheep. Altogether I have, say, from 28,000 to 30,000 sheep.

3580. What is your system of farming with regard to sheep?—I do not buy any sheep; I breed them all. I part with the sheep at different ages according to circumstances, such as the prospect of keep and the prospect of markets. I feed a portion of the fat lambs, and I sell a portion of the store lambs. I sell a portion at all ages up to the age at which the ewes naturally go off, what we call draft ewes, at the age of four or five. I may state that I feed for the butcher part of the sheep, but not to the extent that I breed. I breed more essentially to sell for others to fatten.

3581. With regard to your cattle, will you be kind enough to give the number of your stock?—I buy no cattle except the cattle which I wish to finish to send into the fat market. I feed yearly from 150 to 200 cattle, and they are then supposed to go off from two and a-half to three years of age. I have the corresponding younger ages to keep that up, and as far as possible I breed, and wish to breed, and will breed if I find security, as many calves as it is possible for me to breed to keep up that number.

3582. Supposing that you felt the security that you would wish to feel, as I understand, you would increase your breeding of animals upon your farms?—Yes.

Chairman—continued.

3583. At present you limit your cattle for the market very much to the number that you have stated, which you buy in as lean cattle for feeding purposes?—I am obliged to buy in a portion; I have not convenience for breeding all. I should breed more and increase my appliances if I were quite secure. Two years ago, when we considered ourselves tolerably secure from cattle plague, and when the disease was not very bad, I instituted two breeding establishments for the main purpose of rearing calves, and those I am now continuing. They afford me from 60 to 70 calves a year at the present moment. I shall be obliged to augment the cattle by buying. But I ought to state, perhaps, that in Lancashire we have a very good breed of short-horned cattle; I have a portion of grass land, and I am able to keep cattle there for a limited time to suit my own convenience. I have a man stationed there whose principal occupation is to go about amongst the farmers and to buy up young cattle. These are retained on grass land that I occupy there, and are kept together until such times as I want to take them to the North. In the North, turnips are the great things that we feed cattle upon, and I have them come down at a period of the year, perhaps 60 or 80, and sometimes 100 together. After being gathered together and partially grazed in Lancashire, I have them conveyed down to Northumberland to be left over one year and grazed off the next, as the case may be.

3584. Will you describe what has been the effect of the disease on your production of meat, and your general system of farming?—In my opinion, the disease of 1865 and 1866 had a very great tendency to raise the price of meat.

3585. Do you mean the cattle plague of those years?—The cattle plague, I think, had a very great tendency to raise the price of meat. That year, as it happened, I was rather full of sheep in Lancashire. The cattle plague was so very bad in Cheshire that it decimated the country in a great measure, and the Cheshire farmers came and brought sheep in, I might say, rather improperly; they gave more than their worth; at least we thought at that time that they were buying them very dearly. The consequence was, that they put them on grass that was not fitted for them, and I believe that they lost a good many sheep. That was the first cause of it, and since that it has never ruled in the same way that it did before. I think that the outbreak of

Mr. *Rea.*

Mr. *Rea.*

11 June 1877.

Chairman—continued.

cattle plague in 1865 has been the means of raising the price of butchers' meat, and that seems to have continued since.

3586. Did it make any difference to your own system of farming that you were carrying on?—Seeing that I tried to keep myself as clear as possible from disease by not going into the market when there was disease in the country, I have not made any material alteration, though I feel that, if we have not protection and security against disease in cattle, it will be perhaps necessary to make an alteration.

3587. I understood you to say just now, that with regard to your Lancashire grass land, you have a person there who goes about purchasing and putting on that grass land young animals before they come down to you on your more northern farms; did it make any difference to you with regard to that part of your farm at the time that the disease was about?—I did not buy, of course, while the disease was about; I stocked my land with sheep. Before passing over the cattle plague, perhaps I might state to you that in May 1865 and 1866, which is the usual time of entry, I took a farm of good land for the purpose of finishing off those cattle. This disease broke out then, and for the next year I had not an animal on the place; I stocked the folds with sheep to break down the straw. As time wore on one got more confidence, and I have a portion on now.

3588. You represent that the fear of disease now, though you do not have it practically, very much diminishes the stock that you keep, and therefore the supply of the country?—I think it has that tendency.

3589. Dealing with the other diseases, pleuro-pneumonia and foot-and-mouth disease, have you had much experience with them?—I have had hardly any experience, I may say, of pleuro-pneumonia; I have generally kept free from it by being careful and keeping out of the market when it was supposed to be prevalent.

3590. Has that in any way interfered with your purchasing in the district around you?—Yes, no doubt it has. I have frequently been short of cattle on account of not thinking it prudent to buy them.

3591. In fact, the existence of these diseases in the country as they exist now, to a great extent limits the stocking of land?—I think that people would stock the land with more cattle if they had greater confidence in doing it.

3592. Have you had any losses from foot-and-mouth disease?—Yes, in both sheep and cattle. The most serious loss I had was about four or five years ago; I had from 40 to 50 cattle forward in condition in the months of September and October that I wanted to put into the market about Christmas; by some ill luck foot-and-mouth disease came amongst them (in fact, I knew whence it came), and those cattle were thrown back, and I was not able to sell them until the months of February and March, thereby having to feed them twice. I considered that the cattle were reduced in value by keeping them, from 2 *l.* to 3 *l.* a head, and it seemed to me that while they were being fed a second time it extracted from the food of the people a considerable quantity of beef.

3593. That is to say, the delays arising in the market from the existence of foot-and-mouth disease diminished the consumption, because you had to keep the cattle over a second preparing?—Quite so; while they were being kept longer than they would have been other cattle were being neglected.

3594. If they had gone off before the disease appeared you would have been able to bring another set of cattle upon the market for consumption?—Quite so.

3595. Have you thought over the possibility of attempting to stamp out pleuro-pneumonia and foot-and-mouth disease by restrictions in our country?—It is very well known that when restrictions were imposed in 1866 and 1867, the country was never more free from pleuro-pneumonia and foot-and-mouth disease.

3596. You confirm the opinion that was expressed by Professor Brown, that during the period when the cattle plague restrictions existed we very nearly stamped out pleuro-pneumonia and foot-and-mouth disease?—I think for a time we did so entirely.

3597. On that ground you would say that although the disease is generally supposed to have become almost indigenous, you believe that with a system of restrictions such as was then adopted, you would be able again to stamp it out?—At all events, it is bringing the risk to a minimum, and I think that we should be able to stamp it out. I think I am expressing the feeling of many of my neighbouring agriculturalists when I say that we should be only too glad to submit to any great restrictions in order to stamp it out.

3598. Are you aware of the evidence that has been given by Professor Brown, and the scheme by which he proposes to stamp it out?—I am in some degree.

3599. Speaking from your own great personal knowledge, and from your knowledge of the opinions of other people who are interested in farming in the country, do you think that they would be prepared, contrary to what Professor Brown stated, to submit to restrictions as to the movement of cattle throughout the country for the purpose of stamping out this disease?—Quite so. Where it was necessary, they would be only too delighted that it should be put in force.

3600. With the object before them of getting rid of a disease which practically very materially limits the stocking of their land?—It would give them very much confidence, and I think that an agriculturalist has, in some degree, a right to expect that he will be protected from disease. It is an anxiety and a care hanging over his head while any disease is going on, that I myself fancy he has no business to be subject to if there is any possibility of stamping it out; and certainly the means that have been proposed are the readiest and the most likely means of checking it and stamping it out.

3601. And where they have been attempted in other countries, such as Denmark and Schleswig-Holstein, they seem to have been effective in stamping it out?—Yes, I believe so. I am not prepared to say that it will be stamped out at once, but I think that I am justified in saying that it would be reduced to a minimum by proper restrictions.

3602. You represent that if it were possible to stamp it out, you would by doing so very much increase the supply of meat for consumption,

Chairman—continued.

tion, because you would induce farmers to increase their stock?—Yes, clearly.

3603. And you would also increase the supply by the fact that you would get the stock upon the market at the proper time, instead of having it delayed, as it very often is, upon the farms in consequence of foot-and-mouth disease coming in and throwing it back?—In speaking of foot-and-mouth disease, I do not think there is anything more annoying and destructive than it is, particularly as to breeding animals. If it gets into a large flock of ewes in the autumn or in the spring before lambing time, no one can tell the havoc that it makes amongst them, and I believe there is inherent in that stock for generations to come a weakness of constitution which otherwise would not exist.

3604. You mean that the stock itself and its subsequent produce suffer very materially from it?—Very materially.

3605. That applies equally, does it not, to breeding cattle?—Unquestionably. I believe it is equally so with cows.

3606. They often drop their calves afterwards, do they not?—I believe it is very well understood that they not only drop their calves, but that they suffer to a great extent themselves for a considerable time in their milking properties.

3607. Have you thought at all of the desirability of stopping the import from abroad, in consequence of your wish to stamp out these diseases?—I do not think we shall ever be secure until it is done, nor shall I feel any chance of security until it is done.

3608. That would come in conjunction, I suppose, with the severe regulations which you propose to carry out in the country itself?—Quite so.

3609. And if the farmers are willing to submit to those regulations, they have a right, in your opinion, to ask that they shall be protected from the importation of the disease again from foreign parts?—I think that farmers would have a great right to complain if restrictions were put on, and the fountain-head, which they consider to be the Continent, were not gone to.

3610. Do you believe that the Continent is the fountain head of pleuro-pneumonia and foot-and-mouth disease, as well as of cattle plague?—I am not prepared to say that.

3611. It is with regard to the fear that is engendered in the mind of the farmer from the importation of cattle plague that you think that importation of live animals from the Continent ought to be restricted or stopped?—I think so.

3612. And you believe that the farmers are willing, with regard to the other complaints, to submit to any regulations which have for their object the eradication of the disease?—There is no doubt of it.

Mr. *W. E. Forster.*

3613. You were a cattle breeder, I suppose, before 1865?—Yes, more or less.

3614. Had you as much land in the trade then as you have now?—Not quite so much, but nearly as much.

3615. Have you more or less cattle now upon your land than you had before 1865?—I had more land, consequently more cattle; but fewer

Mr. *W. E. Forster*—continued.

cattle in proportion to the extent of land, having stocked it more with sheep.

3616. Then you breed more animals per acre than you did before 1865?—No; I do not say that.

3617. I understood you to say that, proportionately, you had more cattle?—I have more land, and consequently more animals.

3618. Then the cattle plague of 1865 has not, in your own individual case, stopped your breeding of cattle or diminished it?—It did for a time, as I have stated. I had a farm which I had not one single animal upon, until I thought the disease was out of the country again.

3619. I understood you to say that not only had it done so at the time, but that you thought that the effect of it was still existing, and still diminishing the breeding of cattle?—People have got a little more confidence within the last two or three years with regard to cattle plague.

3620. All this was the effect of the cattle plague of 1865; do you think that the outbreak of cattle plague in 1872 had any effect in diminishing the quantity of cattle?—There was a considerable diminution at that time.

3621. The number of animals that died were not many; but do you think that the way in which the farmers were frightened, had any perceptible result in diminishing the number of cattle?—I believe the farmers would not buy cattle so freely as they would have done if that outbreak had not taken place.

3622. You remember the outbreak of 1872; do you think that that had any effect on your mind in the conduct of your own business?—No doubt. There is no outbreak of disease but what affected the mind of every farmer very severely.

3623. But do you sufficiently recollect your experience in 1872 to remember, whether the fact that there was some cattle plague in the East Riding did or did not cause you to breed less cattle in that year?—I do not think it did in that particular year.

3624. Take the outbreak of this year; do you think that it has had any effect on your trade in making you act differently from what you otherwise would have done?—There has not been time for it; we do not breed cattle in a week or in a month; we have to lay down a system to do it.

3625. I presume that you agree with most persons in supposing that the danger of that particular outbreak is very much removed; there has been no case for some time?—I shall be very glad if it is so.

3626. Do you think that the outbreak of cattle plague in the spring of this year, has at the present moment an influence on your mind to prevent your stocking your farm as usual?—It has this influence, that if I thought that there were not proper steps taken to protect the farming interest from cattle plague, I should reduce the quantity of cattle, and stock more with sheep. It is a wide question, but I think that it is just possible that the risk of it would be far more than the benefit of continuing it altogether.

3627. That is for the future; but does or does not what has actually happened this year operate upon your mind to prevent your buying stock?—Yes, it certainly does, and it has done so this spring.

Mr. *Rea.*

11 June 1877.

Mr. *W. E. Forster*—continued.

3628. And in consequence of what has happened this spring you think you will probably breed less cattle this year than you did before?—If I had not been afraid of cattle plague this spring, in all probability I should have bought within the last three months a considerable number of cattle; but in place of that I have not bought one, excepting calves, from my immediate neighbours, where I knew that there was no risk.

3269. Whereas, last year at the same time, you did buy?—Yes.

3630. Now we will take foot-and-mouth disease. Happily you have not had very much experience yourself of foot-and-mouth disease?—I have had a good deal of experience of foot-and-mouth disease.

3631. You described one particular case, and you said that you had traced where the disease came from; where did it come from?—I bought the animals in a public market.

3632-3. What sort of animals were they?—Young cattle; year old cattle.

3634. You did not trace it any further to find out where it came from?—No. I bought them in the market, and I expected that they were clear of disease or I should not have bought them; but they came home, and the disease developed itself in a short time, and affected the other cattle.

3635. Do you recollect how long the restrictions lasted with regard to the markets, and the movement of cattle at the time of the cattle plague?—I could not say positively. I do not know exactly.

3636. It was some months, was it not?—Yes, it was some months, but I do not know the exact period.

3637. There was no attempt to escape from those restrictions in your neighbourhood, was there; did any of the farmers try to avoid the restrictions?—No, I do not think they did; there was no necessity for it. After inspection by an order, cattle were allowed to move within a certain radius.

3638. Did you not hear that in some parts of the kingdom there was a good deal of difficulty in carrying out the restrictions?—There was, of course, a good deal of inconvenience occasioned at times.

3639. I suppose at that time in Northumberland you knew what a terrible disease cattle plague was?—Yes.

3640. I understand that it is your opinion that the farming community would suffer as much inconvenience whatever it was, and for as great a length of time, in order to get rid of foot-and-mouth disease, as they did in order to get rid of cattle plague?—I think that they would submit to any fair regulation that was necessary to do that.

3641. Would they submit to as much?—Yes, they would submit to all reasonable restrictions.

3642. I am afraid that I must put it in the way that I did before; whether they would submit to as much restriction as they did with regard to cattle plague?—If it was necessary they would.

3643. They would only require to be convinced that it was necessary to submit to it?—Certainly.

3644. I understood you to say that you thought the higher prices that have ruled during the last few years were a good deal owing to the cattle plague of 1865?—I think that the cattle plague of 1865 had a tendency to raise the price of beef and mutton at that time, and it has continued more or less since.

Mr. *W. E. Forster*—continued.

3645. Do you think that the cattle plague of 1865 has anything to do with the present price of beef and mutton?—I think that it has, to a certain extent.

Mr. *Wilbraham Egerton.*

3646. With regard to foot-and-mouth disease, are you in favour of greater restrictions than are at present carried out?—Yes; under proper form; under a universal form; but I think it is no good to restrict one place and not another where it has shown itself.

3647. Your point is that farmers would be willing to undergo more restrictions if foot-and-mouth disease were prevented from being imported from abroad?—If foot-and-mouth disease showed itself in a particular district, they would willingly submit to the necessary restrictions to stop it.

3648. You are aware, are you not, that many counties have not taken advantage of the Orders in Council by which they might have made greater restrictions on the movement of cattle than they have done?—I believe it is so; they might not think it necessary.

3649. As two or three years ago the farmers were in many cases not in favour of severe restriction being imposed on account of foot-and-mouth disease, do you think that their opinion has changed?—I think most decidedly so, if that was the case; but I am not aware that farmers were so much opposed to it as that dealers were opposed to it. I think that those men who dealt in cattle, and wanted to drive them about the country, were opposed to it, and not the farming interest.

3650. I argue that farmers were opposed to the restrictions because in many counties those restrictions were not strictly carried out. Are you in favour of the closing of fairs and markets for foot-and-mouth disease?—If there is disease about the district, of course I think that they should be closed.

3651. Are you prepared to advocate the closing of all fairs and markets in any county where foot-and-mouth disease exists?—For a time, because otherwise you are disseminating the disease.

3652. That has never been done hitherto, has it?—No; I think that that is a question that ought to be left for the orders of the Privy Council by their inspectors.

3653. But the orders of the Privy Council are not at present compulsory; are you in favour of compulsory orders throughout the kingdom?—Certainly.

3654. Wherever foot-and-mouth disease breaks out?—Yes; I am in favour of an universal plan to check it. I am in favour of the Order coming from the Privy Council, and I think that their inspectors should have the power to say that within the district no cattle should be moved.

3655. You are in favour of vesting all the responsibility and all the power in the Privy Council, and taking it away from the local authority?—Yes.

3656. You

Sir *Rainald Knightley.*

3656. You said, I think, as everybody knows, that the slaughter of cattle in 1866 and 1867 by diminishing the supply increased the price of meat?—I think so.

3657. You are aware, are you not, that that disease attacked breeding cows especially?—Yes.

3658. And therefore by that cause the supply of cattle was diminished not only for that year, but for several years to come?—No doubt of it.

3659. And therefore the loss to the farmers, and to the community generally, was not confined to those two years, but extended over several subsequent years?—No doubt of it.

Mr. *Jacob Bright.*

3660. I understand that you consider that at present the farmer is not enough protected in regard to diseases of cattle; is that so?—Yes.

3661. You wish him to be more protected than he is in that respect?—The farmer considers that cattle plague and other diseases have been imported, and he thinks that he has a fair right to ask to be protected from disease being imported.

3662. Will you tell me in what way you would establish more protection than you have at present?—In the first place, by prohibiting the importation of foreign cattle, and then in the next place, that if an outbreak takes place there should be a distinct and universal order to prohibit and check the movement of cattle within an infected district, and not as it has been that one local authority orders one thing, and another local authority upsets it. As it has been, one local authority has allowed cattle to be taken from one county into another, and the next local authority has not allowed it to be done; and there has not been the universal regularity that is necessary, I think, to check the disease.

3663. Then do I correctly understand that you consider that the farmers can only be properly protected, by absolutely shutting out all foreign cattle?—I think that it is a step very well worth trying, and I think it is the first step that would protect them.

3664. You think that without that there can be no proper protection?—I am afraid not; I do not see it.

3665. When you speak of shutting out foreign cattle, do you include Irish cattle?—No; I should simply leave Ireland as part of England.

3666. You would let them send over diseased cattle?—I should prohibit Ireland from importing foreign cattle, and I should use the same restrictions in Ireland as we do in England

3667. You say that you have land in Lancashire?—Yes.

3668. Probably you will know something of the people in Lancashire?—A little, not very much.

3669. If you were to shut out all foreign cattle from this country, do you think that nothing would be said in a great county like Lancashire; do you think that the people would bear it very peaceably?—I may be wrong, but it is my opinion that the introduction of the disease into England has done more to raise the price of beef, and to reduce the quantity of beef, than the introduction of foreign cattle has ever done

Mr. *Jacob Bright*—continued.

to reduce the price of it. I think that the introduction of disease has decreased the quantity of beef.

3670. Are you not aware that we had disease before we had trade in cattle from abroad?—Which disease?

3671. Various diseases; I suppose foot-and-mouth disease, at any rate, and pleuro-pneumonia. Had we not those diseases before the importation of foreign cattle?—I cannot answer that question.

3672. You never understood that in 1841 and in 1842, before free trade in cattle, we had diseases amongst our own cattle in this country?—I suppose that our cattle are subject to certain diseases, more or less.

3673. If they are subject to certain diseases, may they not be subject to foot-and-mouth disease and pleuro-pneumonia?—It may be so; I have not sufficient experience to say that.

3674. With regard to cattle plague, I suppose since the great outbreak of 1865, when we had no means of protection, because we had no legal powers then to interfere, we have had scarcely any cattle plague in this country; is it not so?—I think that with the exception of a little outbreak in 1872, there has not been so much.

3675. Have you not heard it said that the actual direct cost (I am not now speaking of the inconvenience that the farmers suffer) to the country since the outbreak of 1875 has not been perhaps more than 20,000 *l.*?—The country would submit to the cost of it much more readily if they were satisfied that means were taken to prevent it; and I am of opinion that the best means to prevent it is to prohibit the introduction of foreign cattle. I think the country would submit to the cost with greater willingness if that were done.

3676. Do you think that the people would be willing that a considerable per-centage of their whole supply of meat should be shut out in the hope that you might, but not with the certainty that you would, get rid of some of these diseases?—I suppose the people would not like to be without their food, but I do not apprehend any such thing. I think that we are capable of feeding more cattle in England, if we could go on with greater freedom; and if the evidence from America is anything like correct, we may look for such a supply of dead meat from America as will go far to make up any deficiency that may be experienced.

3677. Do you not think that people will not only want the dead meat, but the live meat also?—We have live meat in England.

3678. But I mean the live meat from abroad?—I do not think that they will; if it is shown that the dead meat is brought in in such quantities.

3679. What we want is abundance of food, and it is desirable to have meat at a moderate price?—Why not kill them and bring them as carcases? I should not prohibit their sending as much dead meat as they choose. What we want is to give every opportunity to all countries to send in dead meat, but we want to prohibit the chance of the disease coming. We want a fair field; we are not afraid of opposition, but only of disease being imported.

3680. Have you not heard it said that a cry might be raised even to shut out the dead meat,

Mr. *Rea.*

11 June 1877.

Mr. *Jacob Bright*—continued.

on the ground that it would introduce the disease as well as the live cattle?—I have not heard that.

3681. Should you be surprised to know that we have received evidence, that the day may come when we may require dead meat to be shut out also, lest it should produce disease?—I think it will be time enough to raise that question when there is any chance of its doing so. I have not heard of its doing so.

3682. Is it not a fact that dead meat from Germany is now shut out, as well as live cattle?—I am not aware that it is.

Mr. *Elliot.*

3683. When did the importation begin from the Continent?—I cannot carry the dates in my mind.

3684. Do you know when the first outbreak of cattle plague in England was?—I think it was in 1865.

3685. Was that imported?—It has always been understood so; there was no doubt that it was imported. I suppose that that has been proved.

Mr. *Ritchie.*

3686. When you speak about your belief that the people of this country would be willing to bear whatever restrictions might be necessary to keep out the cattle plague, and that with that object they would consent to the keeping out of live meat, do you mean the consumer or the farmer?—I speak more of the farming interest.

3687. Not so much of the consuming interest as of the farming interest?—I hold that by doing away with the risk of disease we should produce more beef in England, and supply the public better of course.

3688. Do you know what proportion of its meat London derives from abroad?—No, I do not.

3689. Have you any doubt that the prohibition of the importation of live animals would, at any rate, immediately have an effect upon the price of meat?—I do not see why it should, if they have dead meat.

3690. Do you believe that the importation of dead meat would be as large as the present importation of live meat?—I think that if we are to believe part of the evidence that I heard the other day it would be very much more.

3691. Would it come into operation immediately?—From what I have heard I think that within the last 20 weeks it seemed to be an increase of about 60 or 70 per cent., if I speak correctly.

3692. That is with reference to the importation of American meat. Our present supply from the Continent is altogether live animals; do you believe that if that supply were prohibited we should get immediately from the Continent the same supply of dead meat as we are now getting in live animals?—I think that they would very quickly find out the means of sending it dead if they were prohibited from sending it alive.

3693. Would not that take some time?—It might take a few weeks; it does not take long to slaughter an animal and send it across.

3694. Have you heard the evidence as to whether or not that would be a profitable thing

Mr. *Ritchie*—continued.

for the exporters on the Continent?—I am not at all prepared to give evidence about that. I do not know the relative cost of dead and live meat, but I should naturally say that the cost of bringing a carcase would be less in proportion than the cost of bringing a live animal.

3695. It would resolve itself, after all, I suppose, into a question of whether it paid the exporter on the Continent?—Yes, I should think so.

3696. But if it did not pay the exporter to send the dead meat here, it probably would not come at present?—Quite so.

3697. And if we did not receive such a supply, the immediate effect would be a large increase in the price to the consumer in London?—They are not sending it dead now, but I think, if they were prevented from sending it alive, they would very soon send it dead, if it suited their purpose; and it would suit their purpose if this was their best market.

3698. But we have it in evidence from these exporters from the Continent that it would not pay them; if that were the case, I suppose you would say that the prohibition of the importation of live animals would materially affect the price here?—If it were so it might, but I do not see why it should be so.

3699. I think you said that the farmers were desirous of being protected from cattle plague and other diseases being imported; which do you think the farmers suffer more from in this country, cattle plague or pleuro-pneumonia?—I do not know. I suppose they suffer very much from pleuro-pneumonia in some districts and from cattle plague in other districts.

3700. Do you know whether, taking your own view, that the diseases have an effect upon the breeding of stock; pleuro-pneumonia is more to be dreaded by the farmer than cattle plague?—I should say cattle plague was more to be dreaded.

3701. Is not pleuro-pneumonia always more or less in existence?—I am not aware that it is. I do not think that necessarily it is more or less in existence if proper means are taken. I never had pleuro-pneumonia.

3702. In answer to a previous question, you stated, did you not, that you were not prepared to say that pleuro-pneumonia was an imported disease?—I do not pretend to say, and I will not give an opinion, but I have always understood that it was.

3703. But I think I understood you to say that that was not of your own knowledge?—Not of my knowledge; I have been reasonably free from it, but I have always understood that it was imported.

Mr. *Pease.*

3704. Your great object in keeping out foreign cattle is to keep English herds free from disease?—Quite so.

3705. Have you heard the evidence which has been given as to the state of the cattle in Denmark and Schleswig-Holstein, that they are practically free from disease?—I think I heard that stated here on Friday.

3706. Supposing it to be the case that they are free from disease, would you prohibit their coming in?—I think so, as we have no control beyond

Mr. *Pease*—continued.

beyond that; we have no reason to know that diseased animals may not come there.

3707. Supposing that we were certified that Schleswig was free from disease in the same way as we could be certified that Aberdeenshire was free from disease, would you object any more to Schleswig cattle coming in than to Aberdeenshire cattle coming in?—I should, for the simple reason that we have command over the one and not over the other.

3708. Would that be your only reason?—I do not know that that would be my only reason, but it would be a strong reason; we should be left very much at the mercy of the foreign inspectors.

3709. And you do not trust the foreign inspectors as you do your own?—We ought not to.

3710. Supposing that you had your own inspector in Schleswig or in Denmark, would you then object?—I would.

3711. Do you merely object because the inspector is a foreigner?—I think that we should still run greater risk by any animals from the Continent.

3712. If your Englishman in Denmark certified that the cattle were free from disease, and your Englishman in Aberdeenshire certified the same thing, what would be the difference of risk?—I think it has been shown that cattle imported have very often not shown that disease until they were landed in England.

3713. Might not the same thing take place with the Aberdeenshire cattle?—If it were possible it could not continue.

3714. Why not?—Because they would be at once stopped.

3715. Could not the Schleswig cattle be stopped in the same way?—I do not know; I should not have the same confidence.

Mr. *Chamberlain.*

3716. You say that the farmers would be willing to submit to any regulations that were proved to be necessary in order to stamp out pleuro-pneumonia and foot-and-mouth disease?—Yes.

3717. Professor Brown stated that it would be essential in order that those diseases should be stamped out, that the movement of animals should be entirely prohibited in the district in which disease exists; do you think that that is a necessary regulation?—I think that where disease is, certainly they ought to be prevented from moving the animals.

3718. From moving them out of the whole district in which the disease is certified to exist?—That is for the inspectors to say.

3719. Do you think that the farmers would submit to anything that the inspectors thought necessary?—I think so, if they were reasonable persons.

3720. I think you said that when you had foot-and-mouth disease in your district you were allowed to move healthy animals with a pass?—Yes; I was speaking more of cattle plague at the time.

3721. I understood from Professor Brown that he would not allow any movement even of healthy animals, if he were attempting to stamp out disease?—If they had been in contact with unhealthy animals, I think that he would be quite right to prohibit them; I am not prepared to say where the limit is.

Mr. *Chamberlain*—continued.

3722. You would not pronounce any opinion as to whether the farmers would submit to such an extreme regulation as that?—They would submit to any regulation that was fairly necessary to check, and put down those diseases.

3723. But do you consider that those particular regulations are fairly necessary?—I must ask you whether you would take them within a radius of half a mile or a mile, or 100 miles, or how far.

3724. I think that Professor Brown proposed to divide England into 2,000 districts, with an inspector in each?—What extent would each district be?

3725. I do not know over how many miles it would extend, but it is suggested that it would be an average of seven parishes. Leaving that, supposing that, by means of these regulations they were successful in stamping out the disease for a time, might it not be re-introduced, or might it not even occur spontaneously from carelessness in the management of cattle?—That I do not know; we know that these diseases are infectious.

3726. But without infection might not pleuro-pneumonia, which is a lung disease, break out amongst cattle if they were improperly treated?—It might be so, but I never had it, and I have never had foot-and-mouth disease without being able to trace the origin of it.

3727. Have you ever heard of foot-and-mouth disease arising from bad treatment?—No.

3728. From cattle being kept in crowded or ill-ventilated sheds?—Cattle and sheep are subject to a disease called foot-rot, but that has nothing to do with foot-and-mouth disease.

3729. I think it has been stated in evidence that those diseases do arise, in towns, at all events, from bad treatment?—I suppose if an animal is confined in a place without pure air he suffers much in the same way as a human being would; but I do not apprehend that that is a thing which could be looked upon as very likely to occur.

3730. If that be so you would be subject to have those restrictions re-imposed upon you owing to carelessness or bad management of some farmer in the neighbourhood?—I think that they would willingly run the risk of that. There is a necessary and proper discretion to be applied in all those cases.

3731. You think then, on the whole, that the farmers would trust to the discretion of the inspectors?—I think so, if the system were fairly administered.

Mr. *Cameron of Lochiel.*

3732. I suppose these diseases which the honourable Member has just referred to, which are produced by bad treatment, can scarcely be classed as contagious diseases?—I do not class them as such.

3733. Therefore they would hardly come under the category of those diseases to which you referred in your former answer?—Certainly not.

3734. You are in favour of the total prohibition

Mr. *Rea.*

11 June 1877.

Mr. *Cameron of Lochiel*—continued.

tion of the importation of animals from the Continent?—Yes, precisely.

3735. You would make no exception at all?—I would make no exception at all, simply because I think that we cannot be certain without total prohibition.

3736. You think that the existing regulations could not be modified in any manner, so as to lessen the risk of importing animals from the Continent, without going the extreme length of altogether prohibiting importation?—I am not prepared to say that; I did not think that we could with safety admit them, and more than that, I do not see any reason why we should run the risk, when it is proved that we can have as much dead meat as will supply any number of people.

3737. I gather from your answers to an honourable Member, that you consider that the appointment of English inspectors in foreign ports would be attended with considerable difficulties, and that you do not see your way to making that a sufficient safeguard against the importation of disease?—I think that it would be only letting in one end of the wedge; I should be certainly opposed to that.

3738. With regard to the possibility of excluding dead meat from this country, in consequence of there being a chance of the dead meat conveying disease, you have never heard that suggested?—Never.

3739. Are you aware that dead meat is imported entirely now from America, and that they have no disease in America?—I believe they have not.

3740. And, of course, in order to bring disease over by means of dead meat, it would be necessary that the disease should exist in the country from which the dead meat came?—Unquestionably.

3741. Do you consider that there is any possibility of animals having the cattle plague, or the germs of the disease being taken to America, so as to produce the disease there?—I suppose they might import the disease, but I believe they are most arbitrary in their restrictions.

3742. Is it within the bounds of possibility, that the Americans would import live cattle into their Continent from Russia or from Germany?—I should think that they would be too much alive to their own interests to do so. I suppose that if a man wanted to take the disease to America, he could do it; but I think that it is most unlikely.

3743. With the exception of importing very high-bred short-horned bulls or other animals for the purpose of breeding, there is no importation of live animals, is there, from the Continent to America?—No.

3744. Therefore is it not impossible that the disease should exist in America and be brought to this country by mean of the dead-meat trade?—It is practically impossible.

Mr. *French.*

3745. You say that the farmers would be willing to stand any restrictions which were thought necessary in order to stamp out foot-and-mouth disease?—Yes.

3746. Do you think that the consumers of meat would be willing to stand the high price of meat which those restrictions would produce?—I think that it is not fair to say that restrictions would raise the price of meat.

Mr. *French*—continued.

3747. Do you not think that stopping the importation of continental cattle would raise the price of meat?—No, I think that we shall have beef lower in price if they follow out this dead-meat trade.

3748. You think that there is a sufficient quantity of beef in America, which is not required for their own use, to enable them to supply the increased demand which would be caused by stopping the importation of foreign cattle into England?—All the evidence given here tends to show that they have an almost unlimited supply.

3749. Is not the great supply of meat in America at present more or less produced by the depression of trade there?—No doubt that may be so to a certain extent; but I think that while it pays them better to send it to England they will continue to send it; and their resources appear to me to be so great that it will be a very long time before there is any risk of a deficiency in the supply of dead meat. It has been satisfactorily shown that it can be brought in good order and in good condition, and I do not think that there is a shadow of a chance that for a very long time there can be any deficiency in the supply of dead meat from America, always assuming that they have established the fact that they can supply it in good order, and that they are paid for it. If our markets dropped very low from the fact of our own supply being great, and if it did not pay the American to send it, he would not send it; but that would only arise from a very great drop in the price of butchers' meat in England.

3750. How many years do you think it would take to increase our own supply, so as to make up for the deficiency caused by the prohibition of live meat coming in at present from the Continent?—It would require time, but I think the American supply is increasing as fast as it is wanted.

3751. How many years do you think it would take us to increase the number of our own stock so as to be more or less independent of the American trade?—We should want two or three years to do it; but there is nothing in my mind to lead me to suppose that if you prohibit the Continent from sending in live stock, they will not send in dead meat. How is it sent from Aberdeen? I do not see any reason why it cannot be sent from any part of the Continent quite as readily as from Aberdeen.

3752. You think that it might be sent from countries on the Continent?—I see no reason why it should not.

3753. Is it not more difficult for them to get ice on the Continent than in America?—I suppose that they can get it.

3754. Did you hear the evidence of some of the gentlemen from those countries here, who say that it would so diminish the profits which they at present obtain, that they would be obliged to give up the trade if they had to send in their meat as dead meat?—I should not think so; I do not know. But why should we run a risk. I think that we ought to look to our home supply.

3755. But we should not receive that supply at

Mr. *French*—continued.

at all either as dead meat or as live stock?—I cannot see any reason why we should not receive it. They are increasing their breeding every year, and what will they do with it?

3756. They say that if the importation into this country were stopped they would be obliged to change their system of farming; if we were entirely dependent upon American meat, contingencies such as rough weather might leave the country very short of supply now and then, might they not?—I should think that rough weather would affect live cattle very much more than dead meat.

3757. But the distance would be so much shorter from the Continent than from America that they would not feel it so much?—But why should they send over live animals from America; why not continue the system which seems to have been adopted, and which answers very well.

3758. But in case of rough weather that dead meat might be so long in coming that if we were entirely dependent in our markets upon that supply, perhaps we might run very short indeed?—I think that is rather supposing a contingency which is not likely to happen; rough weather might delay a vessel a day or two, but it would not be all in one vessel or on one line. There will be many lines established, I have no doubt, to convey the American meat here, and it will become a system, and they may arrange it so as to supply the English market from more ports than one.

Mr. *John Holms.*

3759. I think that the evidence which you give goes to show that in your opinion we should entirely close the ports against the introduction of any live cattle?—Yes.

3760. And you feel that if the ports are so closed you are capable of extending your breeding in this country to such an extent as to make up for that deficiency?—I think so.

3761. Your trade has been extending lately year by year very much, has it not?—I do not quite say that; but I think there is no doubt that it would extend if we felt full security.

3762. Taking the last ten years, has not the breeding trade of this country very greatly increased?—I think so.

3763. It has increased in the face of the importation of live cattle?—I think so, although I believe that at the present moment there are fewer cattle in England than there have been for some time.

3764. Supposing that the ports were closed, that would not protect you, would it, from pleuro-pneumonia and foot-and-mouth disease?—I think that it would go very far to do so; I think that we should be able to battle with it if the ports were closed.

3765. You have just stated to an honourable Member that, in your opinion, the disease in your flocks will be inherent in them for generations?—No; the weakness from the effects of the disease.

3766. Could you tell the Committee what was the price of meat before the outbreak of cattle plague in 1865?—I suppose that it might range from 6 *d.* to 6½ *d.* per lb., but I do not know with certainty. I am giving a rough estimate.

3767. What would you say was the average price last year?—Since then it has risen very considerably. I should take it on an average that the price has been from 8 *d.* to 9 *d.* per lb.

Mr. *John Holms*—continued.

3768. Would not the direct effect of closing the ports just now be immediately to raise the price, because you say that it would take some time before the American meat could come in any quantity?—I do not think so; I think that the American meat is coming in in such quantity that it seems to meet a great deal of the deficiency.

3769. Would not the immediate effect of closing the ports now against the importation of live cattle be considerably to increase the price?—It might for a week or two, from a sort of terror and dread of its doing so.

Mr. *Anderson.*

3770. You want to stop the importation of live cattle entirely, as a permanent measure, do you, and not merely as a temporary measure?—Yes, if it is found to answer; I think that that is the first thing that we ought to do to protect England from disease.

3771. That would apply not only to the importation of fat cattle for slaughtering, but also to the importation of young stock and store cattle, and milch cows, would it not?—Certainly.

3772. At present young stock and store cattle, and milch cows, come in, to a certain extent, do they not?—I believe they do.

3773. And the farmers buy them?—They are rather foolish if they do, but I suppose some farmers must buy them.

3774. Supposing that they were no longer imported, where would those farmers get them from?—They would have to depend more upon England and upon Ireland, where there are cattle bred in great quantities.

3775. Why are they not dependent upon England and Ireland for them at present?—I think that they are in a great measure. I do not think that many young cattle are imported.

3776. Are there not many milch cows imported?—If they are I think it is a great pity, because I think the disease comes from them, to a certain extent.

3777. To whatever extent they come in the farmers would be obliged to trust more to English breeders, would they not, for the supply of those cattle?—No doubt those who depend upon that for their supply would simply breed more themselves.

3778. They do not breed more themselves at present because they can get them cheaper from abroad, I presume?—Exactly.

3779. Therefore, if you prohibited the import of live cattle the farmers who trust to buying them at present would have more to pay for them?—The farmer would breed them himself.

3780. But he does not breed them himself because he can buy them cheaper than he can breed them?—I think that it is only a drop in the bucket.

3781. Do you yourself breed only for the butcher?—Only for the butcher.

3782. You sell no young stock?—No, I sell no young stock.

3783. I think

Mr. *Rea.*

11 June 1877.

Mr. *Read.*

11 June 1877.

Colonel *Kingscote.*

3783. I think in answer to a question of the right honourable gentleman, the Member for Bradford, you misunderstood him, and therefore I will repeat the question; during the last ten or twelve years you have not bred so much stock as you would have bred otherwise, from fear of disease?—Certainly.

3784. You bought in a great many more; but if you had thought that you had been free from disease, you would have bred more?—Quite so.

3785. And that has been money out of your pocket to a large extent?—No doubt of it.

3786. And in the end, out of the pocket of the consumer; because if you had been able to breed those cattle you would have been able at equal profit to sell meat at a cheaper rate?—It must be a reasonable conclusion that, where a farmer has the opportunity and the means of breeding and rearing his cattle from first to last, he not only has a better profit, but the community are more cheaply served than if the cattle have to pass through so many hands.

3787. Understanding that you farm largely in Scotland, Northumberland, and again in Lancashire, could you not, if there were not so many restrictions upon the movement of cattle, consequent upon disease, at greater profit to yourself bring your cattle gradually down from Scotland to these low country farms and fatten them, and sell them to the public at much less cost?—No doubt. The fewer hands the cattle go through the less it must cost. If there were no middle men more of the profit would go into the hands of the farmer; and not only that, but there would be comparatively no deterioration of the stock from their going to the market and being knocked about the country. They are stopped in their growth and condition for weeks by being knocked about the country in different markets.

3788. Therefore it is that you advocate the endeavour to stamp out foot-and-mouth disease and pleuro-pneumonia by the authority of the Privy Council over those local authorities?—Yes.

3789. Because you believe that it would be efficacious, and you also believe that the farmers would submit to these restrictions?—I think so.

Mr. *Arthur Peel.*

3790. Of course you would prohibit the import of all live animals from a country where cattle plague existed?—I should prohibit the import of all live animals from countries where cattle plague existed.

3791. Supposing that the cattle plague had ceased in that foreign country, so far as all reasonable suspicion went, should you have any objection to introduce cattle from that country and slaughter them at the port of arrival?—Yes, I should.

3792. Supposing, further, that it was known that no disease at all existed in that foreign country, should you object to live imports coming into this country, after the inspector had been on board, and after the cattle had been kept in quarantine for a certain number of hours?—I think that that would be much too uncertain to run the risk of.

3793. In short, you object to the present classification of the countries, as scheduled and

Mr. *Arthur Peel*—continued.

unscheduled countries?—Quite so; I do not think that we should have security from that measure.

3794. And you think that no precautions, however wise or prudent, can guard us against the importation of disease?—I do not think that it is in our power to do so.

Mr. *Chaplin.*

3795. You consider that, at present, the breeders of cattle in England have not proper security?—I do.

3796. And in order to get that proper security, I understand that you could recommend not only the prohibition of the importation of live cattle from the Continent, but that the Privy Council should supersede the local authority?—Yes.

3797. Do you mean by that at all times, or only in cases of outbreaks of disease?—I think that it should be so arranged that the Privy Council should have an universal plan to follow out in the whole kingdom; that if an outbreak occurs their inspector should have power to use such measures as he may think fit, and to take such an area as he feels satisfied will prevent the dissemination of the disease.

3798. But in the case of an outbreak, those powers, you think, ought to be compulsory?—Unquestionably.

3799. Supposing that those two remedies were adopted, and that you had the security that you desire, it would, in your opinion, I suppose, largely increase the amount of home-bred cattle?—I think it would.

3800. To an extent sufficient to compensate us for the loss of the foreign live cattle?—I think so. I think that the introduction of disease from foreign cattle has perhaps tended so much to the diminution of the quantity of meat and to the rise of the price, as to counter-balance any benefit that has arisen from the importation of foreign cattle.

3801. Are you aware that we have had evidence to the effect that we can have an unlimited supply of good meat from America in perfect condition at all times of the year?—I am aware of that.

3802. In answer to the honourable Member for Hackney I understood you to say that the direct effect of prohibiting the importation of live cattle from the Continent would be to immediately increase the price of meat in this country?—It might be so for a week or two, but it could not be for very long if the Americans have the quantity of meat that we are led to believe; and everybody must suffer in some degree to gain a perfect end.

3803. Then taking the supply of American meat into account, if we entirely stopped the importation of live cattle from the Continent, and thereby obtained a largely increased home supply, what do you think would be the ultimate effect on the price of meat in England; would it tend to lower or to increase the price?—That is rather a wide question to answer. It would depend very much upon the supply from America. If they can at all fulfil what they say now it would lower it, no doubt.

3804. But you could not rely upon the increase in home-bred cattle to lower the price at all?—I think that we have power to increase the breed of

Mr. *Chaplin*—continued.

of cattle in England very much now with the introduction of artificial food, which every one is becoming more alive to; and I think that if cattle got above a certain price per pound, and artificial food was at a reasonable price, men who have it in their power would increase the growth of cattle in England so long as it was at a price to pay them.

3805. On the whole, then, are you of opinion that to prohibit importation from the Continent would be a benefit or a loss to the country?—I think that it would be a benefit.

Chairman.

3806. In answer to the right honourable gentleman the Member for Bradford, you stated

Chairman—continued.

that the cattle plague of 1865 had to a certain extent to do with the present price; what I infer that you meant was, that in consequence of that malady being then introduced, a very large diminution in the breeding of cattle had taken place in the country?—No doubt of it.

3807. And that where formerly there were large breeding herds, now the people with the small amount of cattle they have, get lean stock from Ireland and fatten them off quickly in consequence of their dread of this disease?—Yes, I think so; they lessen their risk.

3808. And that the reduction in the breeding herds of the country, practically implied a less supply and therefore affected the present price?—I think so.

Mr. *Rea.*

11 June 1877.

Wednesday, 13th June 1877.

MEMBERS PRESENT:

Major Allen.
Mr. Anderson.
Mr. Assheton.
Mr. Jacob Bright.
Mr. Cameron of Lochiel.
Mr. Chamberlain.
Mr. James Corry.
Mr. Dease.
Mr. Elliot.
Mr. W. E. Forster.
Mr. French.
Mr. John Holms.
Mr. King-Harman.
Colonel Kingscote.
Mr. M'Lagan.
Mr. Torr.
Mr. Murphy.
Mr. Norwood.
Mr. Arthur Peel.
Mr. Ritchie.
Sir Henry Selwin-Ibbetson.

SIR HENRY SELWIN-IBBETSON, IN THE CHAIR.

Mr. CHARLES LENNOX PEEL, called in; and Examined.

Chairman.

Mr. *Peel.* 13 June 1877.

3809. I UNDERSTAND you to be prepared now to put in the Orders that were mentioned the last time you were examined before this Committee, and an analysis of those Orders as was suggested by the right honourable gentleman the Member for Bradford?—I have put in all the Orders in Council that have been passed since the Committee sat in 1873, with the exception of a few that merely altered defined parts of ports, and declared infected places. The analysis that is asked for is the analysis of regulations which has been made by local authorities under the Cattle Plague Order of this year, which I hand in with a specimen of each kind of Order.

Chairman—continued.

3810. These really give a fair sketch of the whole proceedings of the Privy Council dealing with these diseases?—Certainly, since the sitting of the Committee of 1873.

3811. Showing where the Orders come into effect also in the local districts?—Yes; these Orders include those that I put in the other day; this is a complete set.

3812. It shows also when the Orders that were made expired?—Yes.

3813. In fact, it is a complete history of the action of the Privy Council in regard to cattle plague?—Quite so. (*The Papers were delivered in,* see *Appendix.*)

Mr. SEPTIMUS LAMBERT, junior, called in; and Examined.

Chairman.

Mr. *Lambert.*

3814. I BELIEVE that you are a Cattle Salesman in Manchester, engaged very largely in the cattle trade?—I am.

3815. Have you been for any length of time in that trade?—For 20 years.

3816. From that experience, you can speak of the trade that has existed during that time?—Yes.

3817. Has your attention been called to the introduction of the dead-meat trade from America?—Yes.

3818. Have you yourself attempted to go into that trade at all?—No.

3819. Has it come under your knowledge so that you are able to tell the Committee from experience what your opinion of it is?—Yes.

3820. Are there any depôts in Manchester which deal exclusively with that trade?—Yes.

3821. How many are there?—I think there were about 18 altogether.

3822. Have those been established there for any length of time?—About seven months.

3823. They did not begin that trade, then, in Manchester at the time that they first imported American dead meat into Liverpool?—No.

Chairman—continued.

3824. Is the trade in dead meat a large one in Manchester?—It was.

3825. At what time?—In the cold weather, during the months of January, February, and March.

3826. That is to say until very recently it was an increasing trade?—Until within the last three months.

3827. Do you mean that it began to fall off as a trade in the months of April and May and the present month?—Yes.

3828. Up to that time can you give the Committee any idea of the quantities that were imported into Manchester for sale?—I cannot.

3829. You yourself have not dealt in that particular branch of the trade, and therefore you can only speak from general observation of the fact that it has been carried on, and that, in your opinion, it has diminished recently?—Yes.

3830. Are you able to speak as to the condition in which that meat has arrived at Manchester?

Chairman—continued.

chester?—During the cold weather it arrived in good condition.

3831. The first cargoes of it, when it came over in the winter, were able to compete fairly in the market with the English supply?—Yes.

3832. Can you speak as to the quality of the meat that then arrived?—The quality was very mixed; some lots were mixed; some was very good, and some was very inferior indeed.

3833. Were you able to judge of whether the different qualities came in the same cargo, or whether they formed parts of different cargoes?—I examined carcases of meat in the different stores in Manchester, and I found that some of them were bulls, some old cows, and some of them bullocks.

3834. What you mean is that they had sent over a mixed lot of cattle?—Yes.

3835. And the difference in quality arose from that, and not from any deterioration in the meat?—Not in the cold weather.

3836. Since the hot weather came, has there been much of this American meat condemned in Manchester?—Most of the stores have been closed lately in Manchester. The principal store in Cross-street Manchester, was, after an attempt to form it into a limited liability company had failed, was advertised, and sold by auction, with the fittings and fixtures last Friday week.

3837. Was that store established by the importers of the dead meat into the country, or by a private company, who, seeing this trade commencing, thought that they would avail themselves of it?—By a private company.

3838. This one out of the 18 places where the meat has been sold, as I understand you, has already become bankrupt?—Not bankrupt, but it has closed; and this company is the owner of most of the 18 stores in Manchester.

3839. You put that before the Committee as showing that they have found the trade falling off, and that fewer outlets were sufficient for it?—Yes, the excitement of the Amerian meat trade has quite died away, and people are altogether ceasing to eat it in Manchester. Hotels and restaurants never gave a second order for it.

3840. And yet you describe the meat when it arrives in fair condition, as it did for a considerable number of months, as competing fairly with the English supply?—When the first excitement was on about it, people rushed in to eat it, but when they had once tasted it, they did not want it any more.

3841. Have you had any personal experience of it?—No.

3842. You do not speak as other witnesses have done from having tasted it, and finding that when it got cold it was not so good?—I have heard everyone say that when it is cold, it has no taste at all.

3843. You were not present during the examination of the witnesses the other day, I think?—No.

3844. A witness who is a butcher in London, stated in evidence before this Committee, that a very considerable proportion of the meat supplied in the west end of town was American meat supplied as English meat; and he stated that no complaints had come from any of the customers where that meat had been so supplied, showing that at all events the cargoes that were sent to London had not been so flavourless or so different in their quality as you represent them to have been in Manchester?—That would be in the cold weather.

Chairman—continued.

3845. That took place during the months of May and June, the present month; that is his experience, speaking as a practical man in the trade in London; but that is not your experience of what has taken place in Manchester?—It is not. In London, American beef has been sold as low as 3 *d.* per lb. in those months.

3846. It has been stated also in evidence here by importers, that the reason of a very large portion of the supply that has come over having deteriorated in quality, and not standing the change of atmosphere so well, has been the fact that they are at present experimenting rather than sending a steady trade, in order to see how closely they can pack, to what extent they can do away with ice and the other adjuncts, so as to get the meat over in the cheapest possible form; do you believe that that may be the reason why the Manchester supply has fallen off in quality?—No. I have had great experience of the meat trade, and I think that meat can never be moved after it has been in ice. Meat decomposes rapidly after having been subjected to the action of ice.

3847. Are you aware of the method by which this meat is brought over to this country?—Yes, I have read of it.

3848. Are you aware that, being in ice, as you have described, is not part of that method?—It is subjected to the action of ice; I know that it is not in ice.

3849. Are you aware that it is stated that the meat is never, either by being placed in contact with ice, or by being in the atmosphere which the ice affects, brought below a temperature of 34° or 36°, and that therefore it is never frozen?—34°, I believe, is the lowest.

3850. Therefore the meat is never really brought into a freezing condition?—No.

3851. Are you aware that the process is to chill it steadily through, so as to get out the animal heat, and that the statement is that, that having been done and the meat having been so prepared, it takes longer to decompose that meat when it is exposed to the air than it does to decompose a fresh killed animal?—That has to be proved. The Manchester inspector of meat seized only last Friday 24 quarters of American beef recently landed.

3852. But you have no means of telling this Committee whether that formed a portion of a cargo which had been generally condemned, or whether it was part of a cargo of which other parts were in good condition?—Some parts he told me were in good condition, and some parts in bad condition.

3853. I want to get what your own opinion is with regard to this point. Supposing that the trade becomes a sufficiently remunerative one, to induce them to send over a really prime quality of meat such as has been stated to arrive, instead of what I understand you to say was a mixed sort of lot in which old cows and bulls and bullocks were mixed up together, do you believe that that would be equally distasteful to the public?—I do not believe that American meat can ever be sent over to be sold except it is sold within two days after it arrives. All people who have stores in Manchester have told me that unless it is sold in two days, the gravy runs from it, and it changes colour and has the appearance of smothered beef, and the people will not buy it.

3854. How

Mr. *Lambert.*

13 June 1877.

Chairman—continued.

3854. How long is it exposed on the railroad after it has been removed from the cold air chambers of the ship in which it travels?—To get to Manchester it would take 12 hours at least.

3855. Therefore, that means that after it has been three days out of the atmosphere in which it is brought over, it will not stand competition with English killed meat?—No.

3856. You speak of that more from hearsay than from experience, do you not?—I speak from noticing the beef, and from the experience of men who are in the trade.

3857. And of people who have those stores in Manchester?—Yes.

3858. But you are not able to say whether, as has been stated to the Committee, the worst parts of the cargoes which have come over to Liverpool, which they could not sell, or thought they could not sell at the port, have been forwarded to other places for the purpose of getting a market for it; you have had no direct consignment of a whole cargo to Manchester, have you?—No.

3859. You do not think that the supply which has been sold in Manchester may be in some way similarly affected to that which has been described as being sold in London; that is to say, a supply which, from the want of preparation or from competition in the way of cheapening the transit, did not arrive at Liverpool in the best condition; and that they kept at Liverpool, or at the port of arrival, the best parts of the cargo, and anything that they thought was not likely to sell well, they sent forward into the country?—The Manchester buyers go down to Liverpool and buy it themselves from the agents.

3860. Purchasing it themselves out of the cargoes?—Yes.

3861. From that, I suppose that you would consider that this dead-meat trade cannot be a permanent trade competing with the trade in live animals killed in this country?—Certainly not.

3862. Have you dealt at all with the import of foreign cattle?—We import a great many foreign sheep to Manchester every season.

3863. That import is at present very much limited, I presume, in consequence of the slaughtering at Deptford?—The foreign cattle and sheep for Manchester are slaughtered at Sunderland, West Hartlepool, and the east ports.

3864. Those animals that came from Germany, as you are probably aware, are slaughtered at the port of London?—Yes.

3865. Has that continued from the beginning of the cattle plague breaking out?—Yes.

3866. That is a period of nearly three months, is it not?—More, I believe.

3867. For a period of three months you have had all the sheep upon which you depend slaughtered at the port?—Yes.

3868. Have you found that that has injured your trade in Manchester?—Very greatly.

3869. Could you tell the Committee how it affects it?—I can give the Committee the numbers of sheep that have been imported from Hamburg to Manchester during the years when the restrictions were off the cattle traffic. In 1871, when the restrictions were off the cattle traffic, the number of sheep imported from Hamburg to Manchester by Sunderland and West Hartlepool was 30,050.

Colonel *Kingscote.*

3870. Were those alive?—They were alive. That was when there was free transit. In 1872, owing to an order for slaughtering the sheep affected with foot-and-mouth disease, 4,158 were exported from Hamburg to Manchester. In 1873, when the foot-and-mouth disease was not prevalent, 27,518 sheep were imported from Hamburg to Manchester by Sunderland and West Hartlepool alone.

Chairman.

3871. And those came through?—They came through. There was no cattle plague restriction, the foot-and-mouth disease was not prevalent at that time in Germany.

3872. And the sheep were allowed to pass freely?—The sheep were allowed to pass freely after inspection and 12 hours' detention. In 1874 26,042 sheep were imported through Sunderland and West Hartlepool. The numbers brought to the other ports I have not been able to get, on account of so many different agencies being employed.

3873. You do not purchase in London and take through, do you?—Yes, we often sell sheep consigned to the London market and bought by Manchester dealers and brought down. In 1875, when foot-and-mouth disease was prevalent in Germany, 4,210 sheep were exported from Hamburg to Manchester. In 1876, foot-and-mouth disease being then prevalent, 3,960 sheep were imported from Hamburg, against 30,000 in 1871. In 1877, when all foreign stock had to be slaughtered at the port of landing, 2,904 were imported. All these figures refer to the first six months of the year, when the principal foreign supply comes to Manchester.

3874. When you speak of the 2,904 in the last six months, those were dead carcases?—Those were consignments direct from Hamburg to Manchester, but they were obliged to be slaughtered at the port of landing.

3875. And that represents the difference of supply to Manchester of sheep from abroad, as between the free circulation of sheep and the slaughter at the port?—Yes.

3876. Last year they were not under restrictions, were they?—Except that foot-and-mouth disease was present, and if one sheep in a cargo was diseased the whole had to be slaughtered.

3877. But a great number, even in that year, might have circulated through the country?—Three thousand nine hundred and sixty were all that were consigned to Manchester.

3878. But what do you represent caused the difference between the 30,000, which you have described in one year, and that 3,000 in another year?—Foot-and-mouth disease was prevalent, and the dread of having to have them slaughtered at the port of landing lessened the number.

3879. The dread of having to slaughter the whole of the cargo in case one sheep showed a sign of disease stopped the traffic?—Yes.

3880. During the last two years, at least, the trade has been almost practically destroyed?—Yes.

3881. How have you met the supply of Manchester during that time?—During that time the principal supply came from London to Manchester as dead meat; that is to say, they bought the beasts alive in the Islington Market, and sent them down to Manchester.

3882. You have been able to supply the wants of

Chairman—continued.

of your population, although the free circulation of foreign sheep was prohibited?—We have been able to supply them at a higher rate; the cost of the transit of foreign sheep from London to Manchester is ½ *d.* per pound on the carcase.

3883. Is that in addition to your charge?—That is an additional tax, an addition to the cost.

3884. Addititional to what it would have been had you been able to import that same article alive?—Yes; then there is the dealer's profit, which you may reckon another ½ *d.* per pound; that makes it 1 *d.* per extra.

3885. Has the price of mutton risen in that proportion in Manchester in consequence of those restrictions?—Yes.

3886. I suppose that sheep are your principal import from abroad; you do not depend very much upon cattle?—No, very few foreign cattle come to Manchester; Ireland competes with the foreign cattle.

3887. Therefore, if it were possible to allow the circulation of sheep, as far as Manchester is concerned, the markets would not suffer by any restrictions that were placed upon the cattle?—Not so much so; very little.

3888. I suppose that the dead-meat trade that you have described, coming in as it did at the moment when restriction existed on the import of live cattle, to a certain extent, assisted you to tide over the difficulty?—Yes.

3889. And it reduced the price which would otherwise have gone up higher?—Certainly.

3890. You would represent, then, to the Committee, that whilst from the experience which you have had, and from what you have been told by persons engaged in the trade, you do not think that, so far as the Manchester knowledge of the American meat trade has gone, it would ever become a permanent trade which would take its place in the consumption of that district; you believe that to keep prices at the proper level you are very much dependent upon the free import of sheep, at all events, from foreign parts?—Yes.

3891. Is there any other point which you wish to put before the Committee?—I wish to call the attention of the Committee to the fact that I appear here as a witness with the authority of the Salford Markets Committee as representing the council on their behalf.

3892. That is one of the largest markets in the north, is it not?—It is the largest market in the north.

3893. As representing the authorities of that market, would you wish to describe to the Committee the reasons why the import of foreign sheep is necessary for that market?—Yes. In 1857 the number of sheep offered for sale in the Salford Cattle Market was 305,044; and in 1876 the number of sheep offered for sale was 673,971; that is to say, in 19 years the number more than doubled itself.

3894. That shows that you depend every year more upon this import of foreign sheep?—Yes. The foreign sheep are suitable for the wants of the Lancashire operatives; they have small joints, and full of lean flesh, and the people of Lancashire are now getting so much wages that they will only eat the joints. A man wants a joint of some sort; he does not want any rough meat.

3895. You mean that, in consequence of the improvement of the condition of the general population, you are more dependent than you were upon the small lean sheep that you get from abroad?—Yes. Where one man ate meat 20 years ago, I think 10 eat it now in Lancashire.

3896. I understood you to say, that during the last year and a-half, in which you have not been able to get a sufficient amount of import of this kind, you have depended entirely upon the home supply in the London market?—Very much upon the foreign and home supply in the London market.

3897. Although on account of the carriage and other charges the prices have been raised, have you found any falling off in the consumption of meat from people not liking the home animal?—No, they have been getting so much wages that they can afford to buy it. Now they cannot, and it will fall off. The people are getting poorer, and they will not eat so much meat as they have done.

3898. What you would represent, is that they will not buy the English animal, which does not suit them so well as the foreign animal?—There is not a sufficient supply of the English animals to feed them.

3899. But I understand you that during the last 18 months there has been a supply, and that that was a time when this falling off of wages had not taken place?—During the last 18 months wages have fallen off considerably in Lancashire.

3900. Has there been any diminution of consumption during that time?—Yes.

3901. Can you give the amount of consumption in Manchester during the last year or 18 months, as compared with the previous 18 months, when the import of 30,000 sheep took place?—I can give you for the first six months of this year the number of sheep offered for sale in the Salford Cattle Market. The number was 280,368; and in 1871, when the free import of sheep was allowed, it was 356,487. I am speaking now of the time when foreign sheep were imported, in the first six months of the year.

3902. I understand you to be dealing with the first six months of the year in each case, because that is the time when the trade is largest?—Yes; that is the time when most of the sheep come in from abroad those are English and foreign sheep.

3903. You have given us the amounts during the six months of 1877, and the six months in 1871; in 1871 you had free import, and in 1877 you had these restrictions?—Yes. Then I can give you the number of foreign sheep shown in the Salford Market in those years. During the same period in 1871, there were 30,050 foreign sheep; in 1876 there were 3,960; and in 1877, 2,904 altogether were consigned to Manchester; but the latter were compelled to be slaughtered.

3904. You represent that, in 1871, the wages had not risen so as to enable the people to indulge as much in meat as they did subsequently in 1872 and 1873?—I think that the wages were getting very high about 1871.

3905. And you think that in 1876-77, the consumption of meat by those classes has fallen off?—Yes; the consumption has fallen off in 1876-77.

3906. I presume that that is attributable in some degree to the greater cost of the article, and probably also to the fact that they did not get the article that they wished?—Yes, and to the bad state of trade.

3907. Is there any other point that you wish to

Mr. *Lambert*.

13 June 1877.

Chairman—continued.

to lay before the Committee?—I should like to speak with regard to the present restrictions on the movements of cattle in this country.

3908. I suppose your great object is to get as large a supply as you possibly can to deal with?—Yes.

3909. You are aware that the two diseases, pleuro-pneumonia and foot-and-mouth disease, have been very rife lately in the country, and that restrictions have been enforced in many parts of the country in consequence?—Yes, but I wish to speak particularly about the cattle plague.

3910. Before going to that, do you think the general restrictions for the purpose of stamping out pleuro-pneumonia and food-and-mouth disease would, if they succeeded, benefit the trade?—As regards pleuro-pneumonia, I think you can stamp it out, but I do not think you can stamp out foot-and-mouth disease.

3911. Do you think that any great inconvenience to the trade or hardship on the people, looking at the result aimed at, that is to say, the stamping out of the disease would be caused by placing very stringent regulations for that purpose upon the movement of cattle?—You could not be too strict in my opinion for pleuro-pneumonia.

3912. And those strict regulations, having for their object the stamping out of the disease, would, if they succeeded, be a benefit to the country generally, by increasing the amount of the home supply?—Yes.

3913. With regard to cattle plague, and the restrictions that are in force on that point, what would you represent to the Committee?—I speak as representing the general opinion of people engaged in the cattle trade; everyone is harassed at present by the restrictions of different local authorities, what is the law in one place is not the law in another.

3914. Then do you represent to the Committee that you think that it would be advantageous to do away with the jurisdiction of the local authorities in questions of cattle plague, and to place it all in the hands of the central authority?—Yes.

3915. And that the inspectors should be subject to the authority of the Privy Council?—Yes.

3916. So that uniformity of regulations might prevail generally?—That is my opinion exactly.

3917. Have you at all considered the question of the regulations that should be enforced with regard to the foreign import?—I think that the regulation which is at present in force of 12 hours' quarantine is sufficient; but I think that the governments of the different countries ought to agree amongst themselves to give one another notice of the breaking out of any infectious or contagious disease. The limitation, suppression, and final extinction of contagious animal diseases, should be regarded by every government as a great work to be accomplished in the general interests of civilisation and humanity.

3918. You think that the present international regulations, as they are called, with regard to telegraphing, should be extended?—Yes, and made binding by a treaty of some kind.

3919. You think that it ought to be made as absolutely certain as it could be that telegraphic warning from the spot where the disease first broke out should be at once communicated to other countries?—Yes.

3920. And you think that that being the case, and proper precautions being taken in foreign countries, you might relax the existing restrictions against cattle plague?—Yes.

3921. You think that 12 hours' quarantine for that purpose would be sufficient?—Yes; provided that they send honest information.

3922. I understood you before to say that you think it would be a great advantage to the trade, and that that object being in view, it would create no material inconvenience if strict regulations were established in this country for the purpose of stamping out pleuro-pneumonia?—Yes.

3923. If we did that, do you think that we should be justified in having sufficiently strict regulations to prevent the import of pleuro-pneumonia from abroad?—Yes.

3924. Pleuro-pneumonia is a disease of which it is very difficult to fix the period of incubation, is it not?—Yes.

3925. And therefore, although the 12 hours' quarantine and the restrictions which you say would be sufficient against the importation of cattle plague, would guard us in that case, do you think that they would guard us against the introduction of pleuro-pneumonia?—They might if you were warned by telegram of its existence in a country.

3926. When you were warned by telegram of its existence in a country, you think that the regulations ought to prohibit the whole import from that country until the disease was stamped out there?—Yes, if pleuro-pneumonia was very rife there. And the government of that country would not take precautions against movements of infected cattle.

3927. Dealing with the Netherlands, where there is a very large amount of pleuro-pneumonia, you think that we should be justified in restricting the import from that country until they could give us a clean bill of health?—I think so.

3928. Supposing, always, that the restrictions were adopted in this country also for the purpose of stamping it out?—Yes. With regard to pleuro-pneumonia, I have had great experience among cattle affected with that disease, and I think that our own regulations at present are not sufficiently stringent as regards reporting.

3929. Would you compensate differently?—If you do not compensate the people will not report.

3930. Do you think that the compensation for declared cases of pleuro-pneumonia should be larger than it is at present?—I think it is quite large enough; but I say that the penalty for not reporting is not sufficient.

3931. You would arrive at the end by inflicting more severe penalties?—I would.

3932. In fact, I suppose you would tell the Committee that you think that any restrictions really having for their object the permanent stamping out of the disease ought to be adopted?—Yes. Pleuro-pneumonia is principally kept up in town dairies; and I think that no fresh cattle ought to be allowed to mix with infected cattle. If a dairyman has a case of pleuro-pneumonia, as the law is now, he can bring 10 fresh cattle among his stock, and add fresh fuel to the fire.

3933. Have you many dairies in Manchester?—I keep 40 milch cows myself.

3934. And you are prepared to recommend that certain restrictions should be established with regard to dairy stock?—I am.

3935. I suppose you would put them all under inspection?

Chairman—continued.

inspection?—I would have inspection of town dairies.

3936. Supposing that the disease showed itself, would you stop all additions to that stock until it was declared to be disinfected?—I would not stop all additions to it; I would allow owners to renew their stock, but they would not allow them to mix fresh stock with the infected stock as they do now.

3937. I suppose that your dairies are carried on in the same way as they are here?—There are no dairies in Manchester in the town.

3938. But you look upon the dairies in towns as the hotbed of disease as has been described?—Yes, as the hotbed of pleuro-pneumonia.

3939. And you think that they ought not to be allowed to continue there except under the strongest possible restrictions?—Yes.

3940. Those restrictions must necessarily prevent the taking in of fresh stock as soon as the outbreak took place?—Yes; fresh stock to be mixed with infected.

3941. As soon as the outbreak took place, you would of course not allow any animal to leave that place?—Only for immediate slaughter.

3942. Subject them always to constant inspection by the proper authorities so as to see that they were properly conducting their business?—Yes.

3943. I understand you to say that you had had considerable experience in pleuro pneumonia yourself?—Yes.

3944. And you think that dairies should be subjected to stronger restrictions than other places, from the fact of their being liable to spread the disease?—Yes; town dairies.

3945. Have you any knowledge of the importation of cows from Holland for dairy purposes?—We do not import any into Lancashire from Holland. Another subject about which I should like to speak is inoculation for pleuro-pneumonia. I think that that ought to be compulsory when pleuro-pneumonia breaks out in a dairy stock.

3946. You are aware that there are very different opinions as to the effect of inoculation, and that it has been tried in some countries, and that pleuro-pneumonia remains still a very highly developed disease in those countries?—Yes.

3947. Have you tried inoculation?—I have not tried it, but on the next outbreak I have, I am so convinced of the efficacy of it, that I shall inoculate all my cattle. You get rid of the disease in a short time, and you are able to bring fresh stock upon your premises. You may kill 10 per cent., but pleuro-pneumonia, as a rule, takes 60 per cent.

3948. You have not practical experience of inoculation?—No, I have not, it is from reading.

3949. And you have such faith in it that you propose to try it yourself?—Yes.

3950. Would you say that it ought to be a part of the law until you have made the experiment, and ascertained whether your theory is correct?—I am so convinced from hearing people describe it who have tried it, that I believe it would be a very good law. You can never tell when you are rid of pleuro-pneumonia. If it once gets into your stock it may lurk about your place for two years.

3951. I understand you say that, whilst you are in favour of doing away, as far as possible, with

Chairman—continued.

restrictions against the foreign trade, you think that those restrictions should be still continued in the case of pleuro-pneumonia, and that they should be adopted also in this country, with a view of stamping out a disease which has diminished very largely the home supply, and probably also the foreign supply, of the country?—I think so.

3952. I understand you to say that you think it is possible to stamp it out?—I do not think it would be possible except extending over a number of years.

3953. You agree with Professor Browne that it would take some years to eradicate it, but you think that the restrictions which would have to be borne for years would be well worth enduring for the end to be attained?—Yes.

3954. Do you wish to say anything with regard to foot-and-mouth disease?—With reference to foot-and-mouth disease, I think that the law at present is harassing and vexatious in every way.

3955. Do you attach as much importance to foot-and-mouth disease as you seem to attach to pleuro-pneumonia?—Not the least. I do not anything of foot-and-mouth disease. I think that continual centres of infection has been engendered and kept up by the present law.

3956. In what way?—I will give you an instance. You have a farm, and foot-and-mouth disease breaks out upon it; you are not allowed to remove your cattle for slaughter; first one takes the disease and then another, and a continued centre of infection is kept up.

3957. Do you not believe that it is possible to disinfect the place?—I believe that it is utterly impossible to stamp out foot-and-mouth disease except with cattle plague rules, and it is not worth the while of the country to do such a thing.

3958. You say that you have had experience of pleuro-pneumonia, and that you have yourself animals of your own?—Yes.

3959. Have you suffered from foot-and-mouth disease?—Yes.

3960. When you have had the foot-and-mouth disease in your herds have you not found that it caused a great deterioration of your stock?—Excepting in milch cows the deterioration is very little indeed; in the case of milch cows it is great.

3961. Is that not only from the destruction of the milk for the time, and also from the fear of their subsequent calving?—It injures the milk, glands, and the teats.

3962. Have you had many cows drop their calves after they have had the disease?—In some years; I think about the year 1873 we had a great many; but latterly the outbreaks have not been so bad.

3963. All that, when it does come, of course is a great practical loss as well as detrimental to the cows themselves?—Yes.

3964. Do you think that with regard to your fatting stock, that the foot-and-mouth disease is not very much to be dreaded?—Not so much.

3965. Of course it depreciates your stock for a time, and stops your profit for a certain period?—Yes.

3966. You have to feed twice?—No, not twice; I think perhaps that 1 *l.* in the extreme cases would cover the loss.

3967. You do not think that it throws the con-

Mr *Lambert.*

13 June 1877.

Chairman—continued.

dition of the animals so far back that the first condition is practically lost?—No.

3968. Still, to that extent it is a loss on each animal?—Yes.

3969. In addition to the loss to the supply of the country, you have the fact that you have to keep that stock on your farm as one supply instead of putting on another supply afterwards?—Yes.

3970. So that the foot-and-mouth disease diminishes the supply?—Yes, to a certain extent, but very little.

3971. But you think, notwithstanding that and notwithstanding the deterioration of stock, it is not a disease the severity of which you dread, or which you think it is worth enduring any restrictions for?—My opinion, and the opinion of all practical men in the cattle trade that I have ever talked to, is that it ought to be taken out of the Act altogether.

3972. You would have foot-and mouth disease perfectly unrestricted?—Except with regard to travelling on the high road, or being shown at store fairs; I would not allow them to be exposed in a store cattle fair.

3973. That allows a very large remainder, as I may call it, of restrictions against foot-and-mouth disease. You would approve of the restrictions forbidding movements either to markets or along the roads in cases of foot-and-mouth disease?—Yes, store cattle markets.

3974. What other restrictions are there which you would relax as regards foot-and-mouth disease?—The restrictions at present are not of the least good. In some store cattle markets they take one cow out of a lot and let the others go over the country.

3975. Then instead of relaxing the restrictions in regard to foot-and-mouth disease, you would establish more stringent ones?—I would not allow anyone to expose for sale in an open store market, any cattle suffering from foot-and-mouth disease under a severe penalty, but I do not apply this remark to fat cattle markets.

3976. You would adopt, with regard to foot-and-mouth disease, when declared, the same restrictions as with regard to pleuro-pneumonia, only that you would not compel the slaughtering of cattle?—At present the regulations with regard to foot-and-mouth disease are regulations and restrictions on the circulation of cattle; those you propose to continue?—At present if you own two fields, one on each side of the road, you are obliged to keep your cows in those fields, and you cannot bring those cows across the road to your house.

3977. You would allow a person to move them on his farm as he pleased, so long as he did not take them along a public road or send them to market?—Yes.

3978. But still you do not think that would be entirely safe to withdraw all restrictions as to foot-and-mouth disease, and to allow animals to circulate as people pleased?—It is the opinion of every practical man that foot-and-mouth disease will never be stamped out in this country; but I think those regulations would check it in a great measure.

3979. My attention has been called to the fact that in case of foot-and-mouth disease, it is contrary to the law at present to expose animals in markets and to move them on roads?—It is.

3980. As I understand you, you would not

Chairman—continued.

withdraw those restrictions?—That is the law at present.

3981. You would not relax that law at present with regard to foot-and-mouth disease, but you would strengthen the law with regard to pleuro-pneumonia?—Yes; I mean to say that no restrictions that you can put on, except total stoppage of cattle traffic, will stamp out foot-and-mouth disease, and it is not worth the country's while to do it; the inconvenience would be greater than the loss.

3982. Then you would leave the restrictions just as they are?—In store cattle markets you can show a lot of beasts and take one out and let the whole lot go away, and that is no restriction at all.

3983. What you want is, in fact, that there should be uniformity of restrictions throughout the country, limiting those restrictions as much as possible in case of foot-and-mouth disease, for which you do not think strong restrictions are necessary or advisable?—Yes.

3984. But, when you come to deal with the other two diseases, you are quite prepared to say that very stringent regulations and restrictions ought to be imposed?—Certainly.

3985. Is there any other point upon which you wish to speak to the Committee?—I think not.

Major *Allen.*

3986. I understood you to say that the import of sheep took place principally in the first six months of the year?—Yes.

3987. How is the market supplied during the other six months in the year?—From Ireland chiefly.

3988. Do you get enough from Ireland during those six months?—Yes, from Ireland and from the north of England.

3989. Supposing that we could stamp out pleuro-pneumonia, do you think that we could grow meat enough in this country for the wants of the people?—Most certainly not.

3990. So that what you wish is to perfect free trade, more especially in sheep?—Yes.

3991. You say that you have no dairies in Manchester?—No.

3992. Do you keep all your cows in sheds, or are they roaming about?—They are kept in sheds, and are turned out on the grass in the summer. Manchester is principally supplied with milk from Cheshire by train.

Mr. *Arthur Peel.*

3993. You said, did you not, that the great majority of your American dead-meat depôts were shut up in Manchester?—They are.

3994. Can you speak at all with reference to Liverpool?—I cannot speak with reference to Liverpool.

3995. You do not know whether it is true that any of the stores there have been shut up?—I have heard Liverpool men say so in the markets; I attend Liverpool market every Monday.

3996. And you think, broadly speaking, that meat deteriorates when it is in contact with ice or when it is subject to the action of ice?—My experience is, that the American meat deteriorates in two days when it is exposed to the atmosphere.

3997. What is the length of transit of animals from

Mr. *Arthur Peel*—continued.

from Sunderland and Hartlepool to Manchester?—I should think from about 14 to 16 hours.

3998. How is the meat treated in hot weather?—It often comes very bad in hot weather.

3999. Is there any ice in the vans?—No.

4000. Can you speak as to the quality of the American cattle which the dead-meat trade represents; is it as good as the quality of the meat which is imported alive?—Yes; some of it is very good indeed, and could not be better.

4001. We have had it in evidence that the pick of the American meat is sent to us as dead meat, but that some of the live stock that is sent to us is of inferior quality; do you agree with that?—No. I saw 285 American bullocks in Liverpool on Monday, and they were all in perfectly good condition; there was not a scratch or a bruise of any kind upon them.

4002. Where did they come from?—I do not know exactly. They were under three different people, all Americans. I am certain that the American live trade would work, but the American dead-meat trade never would work. They can bring them alive in good condition.

4003. Can you give us any facts as to the number of live cattle now coming from America?—I have not any facts, but, according to the Manchester papers of last week, about 1,500 American cattle arrived alive in seven days.

4004. Were they of the best quality?—Of the best quality; 200 of them were sold in Liverpool at 32 *l.* each.

4005. What would that represent per pound?—About $8\frac{1}{2}$ *d.*

4006. What was the American dead meat selling at at the same time?—About $5\frac{1}{2}$ *d.* or $5\frac{3}{4}$ *d.* per pound.

4007. What was the price of home-killed meat at that time at Manchester?—It was, beef $8\frac{1}{2}$ *d.*, mutton $9\frac{1}{2}$ *d.* per pound for the carcase of English meat last week in Manchester.

4008. You said that you thought that the foot-and-mouth disease was kept up by the present law; did you make that statement simply with reference to the difficulty of moving cattle affected by foot-and-mouth disease on your own farm when the disease broke out?—Yes.

4009. In short, it is only in that way that you would like to see any relaxation of the restriction?—At present we cannot remove them even to a slaughter-house along the road in a float. If you have this disease, they must all go through it, and perhaps ruin you. I would allow them to be moved in a float or low cart to a slaughter-house.

4010. Along a public road?—Yes.

4011. You think that there would be no danger in it?—Not the least.

Colonel *Kingscote*.

4012. I think you say that this dead-meat trade could never answer?—Not in the hot weather.

4013. Are you not aware that Mr. Lyon, who is a large butcher in the metropolis, said in his evidence before this Committee that in the very hottest weather of last August he saw American meat that had come over in the best state he had seen it in at all?—It might come over and arrive all right, but in two days it would be putrid.

4014. Evidence has been given quite to the contrary; but you still say, although you have never tasted the American meat, that it is your

Colonel *Kingscote*—continued.

opinion that the trade cannot possibly answer?—I give it as my own opinion, and I go by the fact that the principal stores are closing.

4015. Were those stores started by butchers, or by people who, seeing a new trade springing up, thought they would dabble in it, knowing nothing about it?—They called themselves the "American Meat Company"; I do not know who they were.

4016. They were not butchers?—Yes; they were assisted by journeymen butchers of the town.

4017. Is it not a fact that the butchers now buy this American meat and sell it largely?—Not in Manchester.

4018. Do you feel confident of that?—I am certain of it.

4019. Are you aware that it is done in London?—It may be so in London.

4020. And also in Liverpool?—Very few do it in Liverpool. I know nearly all the butchers in Liverpool, and I do not know a single Liverpool butcher who sells the American meat at all.

4021. You cannot deny the fact that so many tons of this meat come over every week?—So many tons come over, and so many tons are destroyed. I see in a paper that I have before me, that American meat has been selling at 3 *d.* per lb. in London.

4022. Do you believe that the whole of this meat comes to London direct?—It comes through Liverpool, I believe, most of it.

4023. And none of it is sold in Liverpool or in Manchester?—A lot of it goes to Leeds and Sheffield, and different markets; it does not all come to London.

4024. But still at Liverpool and Manchester you say that none has been sold?—Yes; a great quantity has been sold every week.

4025. Then who sells it, because you say that these companies are broken up, and that the butchers do not sell it?—Anyone can sell it; I do not know a single Manchester butcher who sells the American dead meat.

4026. Is any sold in Manchester?—Yes; there is some sold, but very little. The last two months it has begun to fall off rapidly.

4027. I think you said just now that the people in Manchester are not buying nearly the quantity of meat that they did, because they were poorer?—I cannot say why it is; I said that there was not the quantity. It is the difference in price; the price is higher, and they cannot afford to buy it.

4028. I thought you said they were buying less meat in Manchester now than they were?—There is less meat comes into Manchester altogether, and there must be less sold.

4029. That might account for there not being such a demand for American meat, might it not?—I should think that there is more demand for American when there is less of other meat.

4030. Did I correctly understand you to say that the consumers preferred the foreign sheep to any English sheep?—No; I said that the Lancashire operatives, the lower class of people, like the foreign sheep because they are more suitable for their wants.

4031. Because they like the smaller joints?—They like the smaller joints; they are full of lean flesh.

4032. Do you think that the Lancashire operatives dislike the American dead meat?—It is a

Mr. *Lambert.*

13 June 1877.

Colonel *Kingscote*—continued.

proof that they do not like it, when the trade has fallen off.

4033. You have never embarked in the trade yourself?—No.

4034. And you do not intend to do so?—I should do so quickly enough if I thought there was any money to be got out of it.

4035. You have given rather a decided opinion about inoculation for pleuro-pneumonia, and also about the diseases of animals; have you ever been bred up to any veterinary learning?—I am a member of the Royal College of Veterinary Surgeons, but I do not practice. I was educated at Alfort, near Paris, under Professor Bouley.

4036. With regard to foot-and-mouth disease, did I correctly understand you to say, that you think so lightly of it that you would do away with all exceptions, excepting those as to moving animals along roads and exposing them in fairs and markets?—Yes, store stock fairs.

4037. Do you not consider that foot-and-mouth disease entails a very great loss upon this country throughout the year?—It brings a loss.

4038. And a very heavy loss?—Yes.

4039. Do you not think that it would be very much in the interest, not only of the producers of cattle, but of the consumers of meat, if foot-and-mouth disease could be put an end to in this country?—You cannot put an end to it, in my opinion; I think that it is indigenous to this country, and that with the movement of cattle it will always break out. It always breaks out in the hot wet weather at the fall of the year. There is generally more foot-and-mouth disease then than at any other time.

4040. You think that it breaks out spontaneously?—Yes.

Mr. *John Holms.*

4041. I think you said that you have seen some live American cattle at Liverpool?—Yes.

4042. And you said that they looked very well?—Yes, very well indeed.

4043. Did they look as well as English beasts?—Quite as well, and in much better condition than some Irish cattle.

4044. Were they in better condition than Continental cattle?—Much better.

4045. If these American cattle come alive and are of so high a quality, and if they could be killed on the other side and carefully preserved and brought over here, the meat would be as good meat as the English meat?—I say that American beef is quite as good as English beef; I do not say anything against American beef.

4046. The whole question, then, is a matter of science and experience as to how to kill it, preserve it, and bring it over?—Yes.

4047. Have you tasted the very best American beef?—I have never tasted any at all.

4048. And yet you say, I think, that it is not good?—I give it as my opinion from hearing people speak of it who have tasted it.

4049. Do you know whether there is any loss of weight in live cattle coming a long distance; that is to say, if cattle were put on board a vessel abroad, and brought here and killed at the time they ordinarily do kill them, is there any real loss of weight?—It depends upon how the cattle stand the voyage. If they eat and drink and do well and are not sick, they do not lose weight,

Mr. *John Holms*—continued.

but if they cannot eat and drink they must lose flesh.

4050. But from you own experience, is there a loss?—I should say that there is a loss in weight, decidedly.

4051. To what extent?—I do not see how you could get at it to prove it. There must be a loss. A man travelling loses weight himself if he is off his food.

4052. But you could not on that subject give any specific figures to guide the Committee?—No, I could not.

4053. Would you consider that the loss by carriage by sea would be greater or less than the loss by carriage by rail; that is to say, would live cattle coming, say from Aberdeen to London by rail, lose more or less than cattle coming, say from Hamburg to London by sea?—I should say they would lose less; the journey is shorter and quicker

4054. But they would lose something?—Yes; they would lose a little.

4055. You could not fix any amount in that case either?—No.

4056. What is the ordinary way of buying and selling live cattle in this country; is there any fixed mode of arriving at what you consider to be the value?—No; there is no fixed mode. A man has to buy by his intelligence. His intelligence tells him what to give. There is no measuring, or weighing, or anything like that in this country.

4057. Are you aware that in America they fix it by the live weight?—Yes.

4058. But you do not do so here?—No.

Mr. *Norwood.*

4059. Have you had any business in cattle alive or dead from the Continent?—Yes.

4060. Would it be desirable, in your opinion, to stop the importation of live cattle?—I think not.

4061. You think that would be a very great disadvantage to the country?—Yes; I think so.

4062. These cattle are useful, and come over in fair condition?—Yes.

Mr. *French.*

4063. You say that you are in favour of imposing heavy penalties upon persons exposing for sale in the market cattle that are suffering from foot-and-mouth disease; what would you propose to do with cattle amongst which foot-and-mouth disease broke out when they were in transit?—I should allow them to take them to some farm until they recovered.

4064. Do you keep any sheep at all?—Yes.

4065. Have you ever suffered from foot-and-mouth disease amongst your sheep?—Yes.

4066. Did you find the loss which you suffered from the effects of foot-and-mouth disease amongst the sheep greater or less than amongst the horned cattle?—The loss amongst sheep is very slight compared with the loss amongst horned cattle. It is nothing at all amongst sheep.

4067. Have you had it amongst breeding sheep?—Yes; amongst breeding ewes. The loss would be greater there.

4068. Do you think that it would be possible to stamp out foot-and-mouth disease by restricting the movement of cattle?—It would; but it is not worth while. The remedy would be a great deal

worse

Mr. *French*—continued.

worse than the disease, and the disease being indigenous would break out again.

4069. Do you not think that foot-and-mouth disease is carried from farm to farm by other means than by cattle?—I am certain that it is carried by hares. I have had it brought by hares myself on my own farm.

Mr. *King-Harman.*

4070. You say that at one period the American dead meat was selling in the Manchester market at from 5 *d.* to 5 ½ *d.* per lb. at the same time that the live cattle from America were selling at about 8 *d.* per lb.?—That was last week.

4071. What difference would the offal make on that?—They do not give the offal with the carcase.

4072. But the American beast was sold as he stood?—The offal would make from 1 *d.* to ¾ *d.* per lb.

4073. Then the dead American meat was bought by the salesmen?—Yes.

4074. And the live animal was bought by the retailers, I suppose?—Yes.

4075. Would not that account to a very considerable extent for the difference between the 5 *d.* and the 8 *d.*?—No; the butchers buy the live animal, and they buy the dead carcase in the same way.

4076. But there is another profit to be taken out, is there not?—No; the American dead meat comes direct from the agent to the retailer.

4077. What would you say that the live animal loses a day in travelling after leaving home?—I could not tell; it would be hard work to tell that.

4078. Would it lose a butcher's stone, 8 lbs.?—I should think it would lose more.

4079. Would it lose 14 lbs.?—I cannot tell; I do not see how you can get practically at it.

4080. But giving an approximate idea, would you say that it would lose over 8 lbs.?—Yes, I should certainly say that it would lose over 8 lbs.; from the urine and the fœcal matter from a beast you lose over that weight.

Mr. *M'Lagan.*

4081. I suppose that cattle will lose weight in travelling according to the quantity of food or water that they take, and if they are well provided with these on the journey they will lose less?—Yes.

4082. Is your trade principally that of selling live cattle?—Yes.

4083. Are they generally consigned to you, or do you purchase the stock?—They are all consigned to us.

4084. And therefore any law that would prohibit the importation of live stock would interfere very much with your trade, would it not?—No, it would not interfere with our trade. When we sell dead stock we get double commission; we charge double for selling the carcases that we do for selling the live stock; when we have any stopped at the East ports we always slaughter them and sell them, and we get double commission.

4085. And therefore it is a matter of indifference to you whether you sell live stock or dead?—It is no matter at all to me.

4086. You stated the number of sheep that were sold at Salford during the first six months of 1871, and during the corresponding six months of 1877; do you know what was the price of meat

Mr. *M'Lagan*—continued.

in the first six months of 1871?—I could not state that; but meat is at present dearer than it ever has been in my recollection.

4087. Even though the consumption is not so great?—Even though the consumption is not so great; the supply is not so great.

4088. But I thought you said also that the consumption is not so great?—It cannot be so great, because there is not a sufficient supply, and if people have not it they cannot eat it.

4089. As I understood you, the consumers in Manchester prefer the foreign sheep because they like a small joint better than a large joint?—Yes.

4090. Did I correctly understand you to say that the meat was more juicy?—As a rule there is more lean and less fat; it is more suitable for their wants.

4091. And it is during the winter months when they get that mutton?—It is from January to June.

4092. During the second six months of the year they get sheep from Ireland and from the North of England?—Yes.

4093. Is it because they are compelled to eat the sheep from Ireland and the North of England that they eat them, or would they not prefer the foreign sheep then if they could get them?—It is because Ireland can compete with any country. The Irish sheep can drive out the foreign sheep because they can afford to sell them in the grass season at a less price.

4094. The kind of sheep that you get from Ireland and from the North of England are quite different from those which you get from abroad, are they not?—Not quite different. A great many small mountain-sheep come from Ireland. Those from the North of England are mostly lean sheep. They are sheep full of lean mutton; the proportion of lean is greater than of fat.

4095. They are not the Leicester stock?—No. Some of them are a cross of the Leicester, but they are principally lean sheep.

4096. So far as your experience has gone, I understand you to say you do not think that the importation of dead meat from America will succeed?—Decidedly not; that is my opinion.

4097. How long will meat killed in this country keep in winter?—I have kept a leg of mutton six weeks myself.

4098. In the slaughter-houses in Manchester, are any provisions made for keeping the temperature low?—The public slaughter-houses in Manchester are models; they are recently built, and are made on the most improved principle.

4099. Are you aware that in the slaughter-houses in America, where the dead meat is produced that is sent to this country, the temperature is very much reduced, so as to preserve the meat as much as possible?—Yes.

4100. Have you adopted in Manchester the means that are adopted in America for keeping down the temperature?—No, it is not worth the while there; the meat gets sold more quickly.

4101. The meat, however, that is killed in a slaughter-house where the temperature is very much reduced by artificial means, is more likely to keep long than when those means are not adopted, is it not?—Yes.

4102. Therefore, would you not say that the American dead meat has a better chance of keeping longer than any meat which is killed in this country, so far as you know, even in the best slaughter-houses?—No, it has not. American

Mr. *Lambert.*

13 June 1877.

Mr. *M'Lagan*—continued.

dead meat decomposes more quickly than English meat.

4103. But if it is killed in a cooler slaughter-house it is more likely to keep longer than any that is killed in this country, is it not?—If it was kept in that temperature it would keep.

4104. It is carried directly from this slaughter-house, not to a freezing temperature, but to a cold temperature, is it not?—Yes.

4105. Do you see any difference between the temperature on board a ship and the temperature in an ordinary butcher's shop?—I believe, from what I have read, that the temperature that this beef comes in is from 34 degrees to 36 degrees.

4106. And in a butcher's shop, in Manchester, it is much higher, is it not?—In a slaughter-house it is generally about 40 degrees; they contrive to place them out of the sun.

4107. And therefore the American beef, so far as we have gone, has that advantage over the home-killed meat; but when you bring it into a butcher's shop the temperature is much higher there, is it not?—Yes.

4108. And still the American beef is kept in a temperature of 34 degrees on board ship?—I believe so.

4109. Therefore everything seems to be in favour of the American beef as regards temperature, and the care that is taken of it until it comes to this country?—Yes.

4110. Do you see any reason why, when you bring it to this country, it should keep so much shorter a time than the meat which is killed in this country?—I could not explain to you the reason, but I know as a fact that it does not keep so long. It easily becomes like smothered beef, of a brick-red colour.

4111. Perhaps that is owing to the operation not being properly performed. How long has this trade been in existence?—I think about a year.

4112. Have you ever seen any trade so rapidly developed in the same time as this American dead-meat trade has done?—The stoppage of the importation of German stock has been in favour of it.

4113. But it has been very rapidly developed, has it not?—On account of the stoppage of the German stock, which has raised prices in this country; that has been in favour of the American meat trade.

4114. You say that you are a veterinary surgeon, and you have, of course studied chemistry and other sciences; could you, from your knowledge of science, have foretold about two years ago that we should get into this country thousands of tons of beef every week from America in very good condition?—Yes; I believe it was foretold about five years ago by Professor Gamgee that this could be done.

4115. By means of freezing?—Yes.

4116. And you are, therefore, not at all surprised that we get the quantity that we do get?—No.

4117. Then you would not be surprised if, in another year after this, the means of importing American beef should be so much improved that we should get it in much better condition than we get it in now?—No.

4118. You think that we should be quite justified in supposing that we should be likely to get American beef in a year or two's time in as

Mr. *M'Lagan*—continued.

good order as we have any English beef?—Yes, in the cold weather.

4119. But it makes no difference, if it is kept always in the same temperature, whether the weather is cold or hot, does it?—They are obliged to expose it to people to sell it.

4120. But you have the same inconvenience with regard to your home-killed beef?—Yes; but they can kill home-killed beef just to suit their convenience. A man can kill one beast or two, just as he has to sell it; but if he gets 20 carcases of beef he must sell it, or it goes bad.

4121. Do you think that if this trade is developed the salesmen, or the importers of this beef, will not adopt means for keeping the beef in this country and selling it as it is wanted?—They will try to do so.

4122. If they can keep the American beef on board ship at a temperature of 34 degrees, do you think that they will not construct cellars or buildings in which they can keep the beef at the same temperature here, and take it out as it is wanted?—It will be regulated by the price, of course.

4123. And therefore there is nothing impossible in that?—There is nothing impossible in it.

4124. If the trade is once fairly established we may look, may we not, to that being done, and to the meat being distributed to the people as it is wanted, in good condition?—Yes, if it pays them to send it.

4125. You do something with store-cattle, do you not?—Yes.

4126. And, notwithstanding that, you are strongly in favour of the restrictions which exist at the present time with regard to foot-and-mouth disease and pleuro-pneumonia?—Yes.

4127. I think you misunderstood a question which was put to you by the honourable Member opposite; I think you said that you cannot stamp out foot-and-mouth disease?—I say that you can stamp it out, but that the remedy would be worse than the disease.

4128. I thought you said that it was indigenous?—You could stamp it out by keeping cattle from travelling, but it would break out again.

4129. And therefore you could not stamp it out as you could the cattle plague?—No; in my opinion it is indigenous to the country.

4130. Do you sell more English cattle and sheep than you do foreign cattle and sheep?—Yes, the foreign stock that we sell are only about one-eight of the whole.

4131. Therefore it would be your interest to have as much home stock as possible?—Yes.

4132. In fact, your business depends very much upon that?—Yes.

Mr. *Jacob Bright.*

4133. You seem to have taken great interest in this question of American dead meat?—I have.

4134. Do you know when it first began to come to this country?—I think it was about last August.

4135. Then that has not been 12 months?—No.

4136. Do I correctly understand from you that a great deal of it has been condemned throughout the whole period of the import?—Yes, at times; but only in the hot weather.

4137. You are not aware that it has been condemned

Mr. *Jacob Bright*—continued.

condemned in the cold weather?—I believe some has been condemned in London; I have heard so.

4138. This year I suppose we have not had above a fortnight of hot weather?—In Manchester we have only had about three or four hot days.

4139. In that case, if it has only been condemned in the hot weather, very little of it must have been condemned?—Yes.

4140. Should you be surprised if I told you that a friend of mine in London buys nothing else for his house but American beef and gets it for 8½ *d.* a lb., and that he buys it because he considers it so much better that the English beef; and should you be surprised to know that he does that throughout the hot weather we have been having?—I should not be surprised, because he can pick his beef, and pick it fresh.

4141. We have had evidence that the trade began at a much earlier period than you spoke of. You have expressed a strong opinion with regard to the restrictions which should be put upon cattle affected with pleuro-pneumonia; do you want stronger restrictions than those which we have already got?—Yes, we want heavier penalties.

4142. With reference to the import of cattle, do you want any other restriction with regard to pleuro-pneumonia than those which we have already got?—I have said that if the Governments would warn one another of an outbreak the present restrictions would be sufficient.

4143. You are not disposed to ask for more restrictions with regard to that disease?—No.

4144. And in any case would you not think that there ought to be the same restrictions at home with regard to the movement of cattle in reference to that disease?—I believe the restrictions are as stringent at home now as they are with regard to cattle from abroad.

4145. Then you are not as anxious to increase the restriction that are put upon the importation of cattle?—No.

4146. I ask you if you are in favour of further restrictions, and, if so, what those restrictions should be?—As regards the home stock, I am in favour of a heavier penalty being imposed upon anyone not reporting pleuro-pneumonia at once. With regard to the importation of cattle, I said that if each foreign government warned this Government by telegram when an outbreak occurred, I think that the present restrictions would be sufficient.

4147. You do not see any advantage in adding to those restrictions?—No.

Mr. *Assheton.*

4148. I think I understood you to say that the sheep from the Continent, which used to be imported alive to Manchester through Sunderland and West Hartlepool have, for the last three months, been slaughtered at those ports?—Yes.

4149. And I think you say that the result is, that the meat from those sheep is sold at a dearer price in Manchester?—The result is that the quantity of meat has diminished.

4150. Has the meat that has come been sold at a higher or a lower price than it used to be sold at before it was slaughtered at the ports?—The dead meat was sold at a much lower price at one time this spring on account of the very bad state in which it arrived.

Mr. *Assheton*—continued.

4151. Was it sold at Manchester at a lower price in the form of carcases than in the form of live beasts?—Yes.

4152. Do I correctly understand you to think that it is desirable that the supply should come to Manchester in the form of live sheep instead of in the form of carcases?—Yes, very desirable.

4153. Why so?—Because the facts show that when you begin to slaughter you stop the trade altogether; the import drops off from 30,000 to 2,000.

4154. Can you account for that?—It is because it does not pay the exporter to send them. He can send them alive to the Paris market now without the risk of a dead-meat trade.

4155. Then does it cost more to bring a live sheep to Sunderland and kill it, and then to bring the carcase on to Manchester, than it does to bring the live sheep straight through to Manchester?—Yes; it costs about 2 *s.* a head more.

4156. Then do I correctly understand you to say that the carcases are much more expensive to convey than the live sheep?—They are not more expensive, but the expenses at the port are greater. The charge for slaughtering, and the wharfage, and the landing, and the other charges, are very great.

4157. Are the expenses of butchering greater at Sunderland than they would be at Manchester?—Yes; it is a precarious trade, and the butchers sometimes strike, and you have to pay them any price to kill the sheep. If there is a large supply they strike, and will not kill them under a certain price.

4158. Did I correctly understand you to say that if the meat came in the form of carcases, you got double the commission on it that you did if it came in the form of live sheep?—Yes, exactly double.

4159. That would rather enhance the price in Manchester, would it not?—The commission would not amount to one-eighth of a penny per pound.

4160. I did not quite understand the answer which you gave just now, that you managed to keep a temperature of 40 degrees in the Manchester slaughter-houses, and yet that you have no artificial means of cooling; what did you mean by that?—I am talking of the public slaughter-houses, which are built so as to be protected from the south-west. The heat of the sun never gets on them; they are protected and ventilated so that no sun gets near them, and the roofs are whitewashed.

4161. I do not want to catch you in any trap, but I do not understand how, without artificial means and ice, you are able to keep any slaughter-house, however well made, at a temperature of 40 degrees at all times of the year?—I do not say that you can in hot weather, without artificial means.

4162. I understood you wrongly then?—Yes.

Mr. *W. E. Forster.*

4163. Does any dead meat come into the Manchester market except American dead meat?—During the cattle-plague, the German and Dutch beef from the Continent of Europe came there.

4164. At what port was it landed?—Princi-

Mr. Lambert.

13 June 1877.

Mr. *W. E. Forster*—continued.

pally at Sunderland and West Hartlepool, and some at Grimsby.

4165. In what state does it get to your market?—It has been slaughtered at those ports.

4166. Is there any dead meat that is exported from any foreign country besides America, that is killed before it leaves the country?—No, it never comes to Manchester.

4167. Then your experience of what you may call the dead-meat trade as exported from a foreign country, is confined to the trade from America?—Yes.

4168. In what months do you think that you have had the largest import of this dead meat?—About January, February, March, and April, I think, into Manchester.

4169. Do you think that it had much effect upon the price?—Most certainly it had a great effect.

4170. Do you imagine that the supply of dead meat can be relied upon to replace the supply of live cattle that come from the Continent?—I do not think it can.

4171. What effect do you think the stoppage of the import of live cattle would have upon the Manchester market?—It would cause a rapid rise in the prices.

4172. I think I understood you to say that you thought it would apply more to sheep than to cattle?—Yes, as regards Manchester. Very few German beasts came to Manchester even at the time when there were no restrictions.

4173. Nevertheless, if you got home animals that would otherwise go to the places to which those German cattle go, you would feel it in Manchester just as much?—Yes.

4174. A good deal of the meat that you consume comes from Ireland, I suppose?—The principal supply to Lancashire in the season when they are fed on grass in the summer months, from June to Christmas, is Irish.

4175. As regard foot-and-mouth disease, do you think that you have got much of it from the Irish animals?—Not lately; Ireland has been entirely free these last two months; it was very prevalent about January last.

4176. I understand you to say that you would not recommend any regulation with regard to foot-and-mouth disease, except stopping the sale in a public place or the carriage of animals infected with the disease?—I would not recommend that they should be reported as at present. The police come on to your place and carry it from one place to another.

4177. The Committee of the House of Commons, in 1873, came to this conclusion: "Many witnesses have been examined with regard to this disease, especially as to its recent prevalence, both in Great Britain and Ireland, and their opinions have been conflicting both as regards the amount of loss it causes and the measures which should be adopted for its diminution. Some agriculturists have recommended very stringent measures such as the stoppage of all fairs and markets, and of the movement of animals, except by license as during the prevalence of the cattle plague. On the other hand, there has been evidence of much weight, both by agriculturists and by professional witnesses, tending to show that such enactments would meet with strong opposition and would be difficult, if not impossible, to carry out. Your Committee have come to the conclusion that it is

Mr. *W. E. Forster*—continued.

hopeless to attempt to extirpate or even materially to check this disease, unless the above-mentioned stringent measures are strictly enforced." And then they go on to say that they think that the public would not bear the enforcement of those measures; that is your view, is it not?—That is my opinion.

4178. With regard to pleuro-pneumonia, I did not quite understand whether you would wish the import of all live cattle to be prohibited from any country in which pleuro-pneumonia existed?—You would have to prohibit it from almost everywhere, if you did that. I said that when the disease was very rife in a country and the government of that country did not take means to prevent infected herds travelling, I should prohibit the importation of live cattle from that country.

4179. But the fact that pleuro-pneumonia was not exterminated in that country would not make you prohibit the import of live cattle from it?—No.

4180. I suppose you are aware that at the present moment the restrictions, with reference to animals affected by pleuro-pneumonia that are imported from abroad, are more severe than in cases in which it is found in a home-herd in this respect; that if one animal in a cargo is found to have pleuro-pneumonia, all the rest of the animals are ordered to be slaughtered; whereas the most that is ever done with the home-herds is that those that have come in contact with the infected animals are isolated for a certain time?—Yes.

4181. You are also aware that, with regard to foot and mouth disease, the same regulation applies; that if one of the foreign animals has it, all the rest are slaughtered?—Yes.

4182. With that difference between the treatment of foreign animals and home animals, do you recommend any further restrictions with regard to the foreign animals?—No.

Chairman.

4183. I did not understand you to state what the price of meat had ruled at in Manchester during the last six months?—During the last six months the whole carcase of beef of the best quality has been 8½ *d.* per pound, and mutton has been 9½ *d.* per pound.

4184. Can you compare that with the six months which you quoted in 1871, and give us the price which ruled then?—It was much lower. It is very much higher than it has ever before been in my recollection.

4185. Do you attribute that to the stoppage of that supply?—Yes.

4186. That is to say with regard to the price of mutton?—Yes.

4187. With regard to beef, I understood you to say that the foreign import did not much affect Manchester?—It does not.

4188. But the price of mutton has risen in consequence of the stoppage of the free circulation of sheep?—Yes.

4189. Can you tell the Committee whether, in Manchester, the proportion of foreign mutton to home mutton, is larger than the proportion of foreign cattle to home cattle?—In the first six months of the year the foreign import of sheep exposed for sale in the market, when there is no restriction, is about one-third of the total number. Very little foreign beef comes to Manchester at all.

4190. I suppose

Mr. *Lambert.*

13 June 1877.

Chairman—continued.

4190. I suppose that the price of the home supply, naturally varies very much according to the feed of the surrounding districts; when you are short of feed in the surrounding districts, the supply is short, and consequently the price of the home supply rises?—Yes.

4191. And that might account for the rise in the price of cattle, as we have had one or two years of very short feed?—Yes.

4192. I understand you to say that you have taken the first six months of the year and compared them, because then the import principally takes place?—Yes.

4193. Taking the last six months, when you depend upon the home supply for your sales, does the price vary with the period at which the foreign supply is coming in?—As a rule, the beef and mutton both fall in price towards the autumn.

4194. But when the home supply comes into the market the price is reduced?—When the home supply comes into the market the grass fed cattle and sheep come in, and the price is reduced.

Chairman—continued.

We cannot feed either sheep or cattle in this country in sufficient quantities to supply the people in winter time. Mr. Hall, of Liverpool, has asked me to make a statement about the weight of a bullock's liver and heart, about which he was examined. He says that he has had the livers and hearts of 20 American bullocks weighed, and that they average exactly 18 lbs. in weight. He says that it has been stated here that the average weight was 40 lbs.

4195. Was not 40 lbs. mentioned in the evidence as the weight of eatable offal, of which the heart and liver only forms a part?—I do not know. He has written to me this morning, and asked me to mention it.

4196. I think that he must have misunderstood the evidence, because, so far as I understood it, it included everything except the head and the tail?—The head with tongue in it would weigh nearly 40 lbs. It would be only the heart and the liver that was weighed.

4197. However, whatever it is, there is evidently a misapprehension?—Yes.

Mr. Archibald Hamilton, called in; and Examined.

Mr. *Hamilton.*

Chairman.

4198. You are a Flesher, in Glasgow, I believe?—Yes.

4199. Have you been for a long time in the trade?—Yes.

4200. How long?—Since I was a boy; 30 years.

4201. You have been dealing largely during the whole of that time as a butcher?—Yes.

4202. Would you tell the Committee whether for your ordinary supplies, you have generally depended upon Scotch animals, or upon foreign imported animals, or upon Irish animals?—The trade has undergone a great change since the cattle plague of 1865. We used not to kill any beef for the dead-meat market before that, but it has reduced the thing to something of the same sort as it is in London. Now, we have a dead-meat market in Glasgow; and, as wholesale butchers, we buy and supply the dead-meat market with cattle.

4203. And you purchase principally from the home trade?—Yes.

4204. Not from foreign countries?—From both occasionally.

4205. Do you get any of the Denmark cattle?—Yes.

4206. Has the trade from Denmark increased lately?—Yes.

4207. Can you give the Committee any idea of the proportion of the foreign cattle as compared with the home cattle that you slaughter for the dead-meat market?—We only get the foreign cattle during a season; we do not get any during the winter months; and I suppose that during the four or five months that we get them they would be about one-sixth or one-seventh part of the average supply in the Glasgow market at that time.

4208. Have you found that the cattle coming from those districts come in such a condition and in such order that they fairly compete with the other meat in the market?—Yes, they sell readily.

Chairman—continued.

4209. They are a supply upon which you can rely for a good sale?—Yes.

4210. In killing wholesale for the dead-meat market do you find any difficulty in slaughtering during the hot times of the year?—No, we can kill them at any time we find it convenient.

4211. I suppose that you kill largely for the daily supply?—Yes.

4212. And you have no difficulty in dealing with your home cattle in killing for that dead-meat market?—Yes.

4213. With regard to this American meat, has your attention been called to that?—Yes.

4214. Have you yourself dealt in that meat?—Yes.

4215. To any great extent?—Yes.

4216. Is that through the consignments of Mr. Bell?—Yes.

4217. Can you state the condition in which that meat has arrived generally?—Yes.

4218. In what condition has it arrived?—In very good order, indeed.

4219. Has that been so as a rule, or have the consignments varied?—As a rule I have had those consignments in very good condition.

4220. To what extent have you had them?—Last week I bought 10,000 lbs. weight of it.

4221. Is it a steady trade, or does it vary?—The week previously it would be a little less; but I have been doing a trade of from 6,000 lbs. or 7,000 lbs. up to 10,000 lbs., these two or three months past.

4222. So that you have been now for some time steadily dealing in this American meat?—For the last 12 months.

4223. And that would include periods of hot weather last year, and the short time of hot weather that we have had this summer?—Yes.

4224. Have you found any difficulty in dealing with the meat when the weather has been hot?—If you buy too much you take your chance of the market.

Mr. *Hamilton.*

13 June 1877.

Chairman—continued.

4225. What has been your experience with regard to the time for which you can keep this American dead meat after it has been taken out of the refrigerators in which it has travelled?—It will keep nearly as long as the home meat, so far as taint is concerned, but it loses colour.

4226. You would endorse what Mr. Gillett, of Liverpool, stated here the other day, viz., that after meat that he had inspected was taken out of the cold chamber he could hang it as against the fresh killed meat?—I do, from practical knowledge.

4227. From that practical knowledge, you believe that this trade, even in hot weather, will become a permanent supply to the country?—Yes.

4228. You say that the consignments that have been imported by Messrs. Bell, with whom you have dealt, have not varied in condition, as has been described to take place in other districts?—We have two lines of vessels from New York, and one brings the meat in better order than the other; but the latter one has only been recently started.

4229. Do both of them come direct to Glasgow?—Yes, the Anchor Line, and what they call the States Line. One brings better meat than the other.

4230. But the fact of their being able to bring a continuous supply of meat in good condition leads you to think that, as soon as the conditions of the trade are properly ascertained, they will be able to bring over meat in such a condition as to compete in the market?—That is already proved.

4231. And it is proved to your satisfaction also that that meat will keep, even after it is taken away from the influence of the cold atmosphere in which it is brought over, as against English meat?—Yes, but it loses colour; it will scarcely compete with fresh meat to bring the same price.

4232. That would be a salesman's difficulty; but have you found that your customers to whom this meat has been supplied have complained of the quality or condition of the meat?—No.

4233. They have taken it in the same way that they take your Scotch meat, or English meat, or Irish meat; and they have been so satisfied with it that no complaints as to its quality have ever been made?—No.

4234. Therefore, although it may not look to a butcher's eye in quite as good condition, practically, for consumption it is equally good with the home meat?—Quite so.

4235. In giving this opinion, which is a very valuable one, are you speaking solely from your own experience, or do you come here representing the trade generally who have dealt in this meat at Glasgow?—From both.

4236. Do you represent more than your own individual experience of the trade?—Yes; I can show you a letter that I have here (*handing in a letter*).

4237. This is a letter from one Mr. Eastman, of New York, who consigns nearly four-fifths of the whole of the beef to Messrs. John Bell & Sons, and it is an entire contradiction to the opinion which has been expressed that this supply would not be a permanent one?—Clearly.

4238. It is stated by the exporter in America, and endorsed by the agent in Glasgow, Mr. Bell, and by your own opinion, not only that the trade will be a continuous one, but that the meat will be brought over in such a condition as to be absolutely serviceable for consumption even during the hot weather?—It is quite likely.

Chairman—continued.

4239. Do you think that it arrives in such a condition as to be able to travel after it is taken out of these refrigerators, and to be sent as a saleable commodity to retail butchers' shops over the country?—Certainly it would, but the weather affects it. If the weather is hot it is dangerous; but I have sent many thousands of pounds of it to the London market myself.

4240. I will not ask at what prices it has been sold, but may I ask if it has fetched a reasonably remunerative price?—Sometimes I have got a good profit, and at other times the market was bad, and I lost heavily; it is very uncertain.

4241. Were those losses, in your opinion, in consequence of the deterioration of the meat from its travelling, or of the fact that the market at the time it arrived happened to be glutted?—The loss arose from the fact that the market at the time that the meat arrived happened to be glutted.

4242. Not from the meat arriving in a condition of depreciated value from its journey?—No.

4243. You would tell the Committee that you have faith, then, in the travelling properties of this meat, even after it has been exposed to the atmospheric influence of this country?—Quite so.

4244. It has been stated by one witness here, I think by Mr. Hall, that the meat, as soon as it is taken out of the refrigerators, was so damp as to spoil its quality for the market; is that your opinion?—It is damp, and it will keep nicely for, it may be, a couple of days; but after that, although it is quite fresh for eating, it will lose its colour; it begins to get a darkish colour, from having been so long in the refrigerator.

4245. Fresh-killed meat in hot weather also assumes that darker colour, does it not?—It will keep a fresh colour longer.

4246. It has been stated by one of the witnesses from America that the reason for its keeping was that the animal heat had been cooled out by the process of preparation, and that, therefore, the atmosphere here did not affect it in the same way as it affected English killed beef, where the animal heat remained in the heart of the joint, and the outside affected by the atmosphere dried; is that your opinion?—It is a thoroughly sound opinion.

4247. Therefore that also tends to show that the American meat can compete, from the process by which it is prepared, with the fresh-killed meat?—There is no doubt of it.

4248. Is there any other point which you would wish to put before the Committee?—I have no suggestion to make. I am only a poor butcher, but anything that you have to ask I shall be glad to answer.

4249. Is there any suggestion that you would wish to make with regard to the American live animal trade?—They complain greatly in Glasgow of the detention that the American cattle are subject to. When they arrive at Glasgow they have to stand over twelve hours; and if they have been 12 or 14 days on the voyage, the sooner they are taken off to good feeding quarters the better.

4250. You

Chairman—continued.

4250. You have been dealing in the import of live cattle from America?—Yes.

4251. Have the animals from America or Canada come over to Glasgow in good order?—I am authorised by Messrs. Bell to say, that previously to last Wednesday they imported, in 15 days, 457 bullocks; and out of that number there were only two deaths, which arose solely from stress of weather.

4252. And they had bad weather on some of those voyages?—They may have had occasionally a stormy day.

4253. Would it not be a very losing concern to send over those animals in the winter months?—It is highly dangerous in the winter; it is only in the summer season that they would send live animals.

4254. And in stormy weather, or in weather in which you are liable to heavy gales, it would be almost impossible to bring over American live meat at a profit?—It would be very dangerous.

4255. But at a time of the year when you are not subject to storms, they arrive in very good order?—In very good order, generally.

4256. And they are a good sound animal?—They are a good sound animal.

4257. The last witness stated that the American meat which he had seen which had come over to this country had been of very varied quality; that some of the import that he had had under his notice was the meat of old bulls and cows as well as of bullocks; has that been your experience?—I have been attending the market closely for the past 12 months, since the American meat trade has been in operation, and I think that on only one or, it may be, two occasions has there been a bull amongst the lot; they have been invariably of the very best quality.

4258. The meat that has come under your notice has been not only in good condition, but of the best quality?—Of the very best quality.

4259. With regard to the live meat, you would suggest that, for what it is worth as an import, which depends, of course, upon the weather, it should not be so restricted as it is at present?—Certainly.

4260. And that no advantage is gained by the detention which it has to undergo, but rather that the meat in the beast is deteriorated by it?—Quite so.

4261. Is there any other suggestion that you would like to make?—We do not like the restrictions at Glasgow at all, we are altogether against them.

4262. I suppose that you are one of those people who like restrictions never to apply at home?—My opinion is that foot-and-mouth disease, particularly, is the direct result of cruelty and bad usage. It is all a great mistake to suppose that it is not brought on by that; it is entirely the result of the bad usage of the cattle.

4263. Do you speak of this from practical experience?—Yes.

4264. Have you seen much of the foot-and-mouth disease?—I have been more or less closely connected with it during all the period that I have been a butcher.

4265. Having seen a great deal of foot-and-mouth disease, you believe that it is produced in many cases by the condition of blood in which the animal is from ill-usage?—I believe that that was the origin of the disease; it is still very contagious; it is just a fever.

Chairman—continued.

4266. At the same time, I suppose, that that would hardly account for the breaking-out of the complaint that occurs among herds where they are neither driven to market nor subject to any particular hardship?—But it may have been brought to them; it is very contagious.

4267. You think that if it was stamped out as a disease it would be reproduced by ill-treatment?—Certainly it would.

4268. Then you are not in favour, I suppose, of any strong restrictions being enforced for the purpose of stamping out foot-and-mouth disease?—Not foot-and-mouth disease; but for cattle plague and pleuro-pneumonia I am.

4269. You are in favour of stricter regulations for the purpose of stamping out either cattle plague or pleuro-pneumonia, the object being to get rid of a disease which diminishes the supply in this country?—Clearly.

4270. And you think, from your knowledge and experience, that such restrictions would be submitted to if you could attain that object?—Yes, with regard to cattle plague and pleuro-pneumonia.

4271. You think that your trade and the consumer's interest suffer by these diseases being allowed to continue in this country?—I believe that the country suffers generally.

4272. Whilst you think that people would submit to strong restrictions for the purpose of getting rid of cattle plague and pleuro-pneumonia, in the case of foot-and-mouth disease you do not approve of additional restrictions?—I do not.

4273. And you do not think that it would be stamped out by those restrictions?—I do not, and there is no science in stamping out at all.

Major *Allen.*

4274. Would you do away with all restrictions in the case of foot and mouth disease?—I would not allow cattle affected with it to be exposed in markets or fairs; but they should be taken to the slaughter-houses without any restrictions to be killed.

4275. Would you allow the animals suffering from-foot-and mouth disease to travel along a highway to a slaughter-house to be killed?—If it was convenient.

4276. Convenient to whom?—I mean if the slaughter-house was not far away, if the danger was reduced to a minimum.

Mr. *Arthur Peel.*

4277. You said that of the two lines that brought American meat, one brought much better meat than the other; can you account for that in any way?—One I think is a better patent than the other. There is some little difference in the mode of fitting up the chamber.

4278. You think that the quality of the meat might be the same in both cases?—I suppose it would.

4279. At all events you think that there is a better arrangement in the one case than the other?—Yes.

4280. You said that foot-and-mouth disease was the direct result of cruelty and ill-usage; have you any suggestion to make as regards the transit of cattle by railway?—It is principally by

Mr. *Hamilton.*

13 June 1877.

Mr. *Arthur Peel*—continued.

by the Irish boats; they are, I consider, the greatest propagators of the disease.

4281. And you think that the steamboat cattle traffic between Ireland and this country is very deficient in proper arrangements?—Certainly.

4282. Between what ports?—We get a great many cattle from Dublin to Glasgow, and from Sligo, and Londonderry, and a few from Belfast.

4283. As to the railway traffic, is there any cruelty to your knowledge?—It is considerably less on the railways. I think if you look at the Report of the Select Committee of 1873, you will find that Professor Fergusson of Dublin says that, although water and fodder was provided at the port of Dublin, the dealers would not allow their beasts to take it for fear of giving them what you call "the scour."

4284. Have you seen cattle landed from Ireland?—Yes.

4285. Have you seen any bad instances?—The cattle are in such a state of thirst that they fly to the nearest gutters and suck up whatever they can get in the shape of water.

4286. You have seen the boats in a bad condition?—There are too many cattle on boar The steam from the beast's breath and other excrescences is dreadful when the hold is opened.

4287. Where are they carried?—Mostly in the hold.

4288. Are they not carried on deck?—Some are.

4289. With a shelter?—The shelter is not very sufficient.

Colonel *Kingscote.*

4290. You are speaking of the different steamers that come to Glasgow only?—Yes.

4291. From your practical experience and knowledge?—Yes, I have seen the cattle landed frequently.

4292. Is it your opinion that, although the cattle are inspected by inspectors before they are put on board the steamers, there is sufficient time between their leaving Ireland and their landing in Glasgow, for foot-and-mouth disease to be generated on board those steamers from what you have described as overcrowding and want of proper arrangements?—Yes, they will be frequently about 18 hours coming from Dublin to Glasgow, and during that time I understand they get nothing.

4293. And you think that that is sufficient to generate foot-and-mouth disease, or at all events, for the disease to develop itself within a week or 10 days?—Very likely it would do so.

4294. Do you consider that that is a source of danger of spreading foot-and-mouth disease throughout England?—Yes, distinctly.

4295. I suppose that the cattle that come from those steamers are not all slaughtered at Glasgow?—No.

4296. Some of them go into the country?—Yes, they do.

4297. And you think that foot-and-mouth disease is propagated in that way?—I think that that is the origin of it, added to the bad usuage they may have got. They may have travelled many miles before, for they are hurried up to the boat, and as Professor Fergusson says, they are not allowed to have food or water for the fear of their scouring.

4298. Are those boats thoroughly disinfected and cleansed after the cattle leave them, or may the seeds of foot-and-mouth disease be left on board of them?—That is a scientific question which I should not like to answer.

Colonel *Kingscote*—continued.

4299. I understand you to think very lightly of foot-and-mouth disease?—Yes.

4300. Have you ever had experience of it among breeding animals?—I have had some experience of it among grazing animals; they soon get over it, if it is a light attack.

4301. Does it not throw them back sometimes?—Yes.

4302. Is it not a loss to your pocket?—It is a loss.

4303. You know nothing about the loss to breeding animals?—No, I am not a breeder.

Mr. *Anderson.*

4304. Are you not chairman of the United Association of Fleshers in Glasgow?—I am not the chairman at the present time, but I am a member of the society.

4305. Were you not specially selected by the association to come up to give evidence upon this occasion?—Yes.

4306. So that, in fact, you are representing them here?—Yes.

4307. And the opinions that you have been giving us about the American dead-meat trade are not entirely your individual opinions, but they are really the opinions of the Glasgow trade?—Clearly.

4308. The Glasgow trade having a great deal of experience in the matter?—Yes.

4309. When the butchers get American meat to sell, do they sell it without any distinction from English meat?—Yes.

4310. They buy American meat and they buy home meat from the wholesale dealers, and then they hang it up in the shops, and sell it without reference to what it is?—Quite so.

4311. It is not specially ticketed "American"?—No; it is not necessary.

4312. Does it bring the same price as the home-killed beef?—Scarcely.

4313. But the reason for its bringing less money is not because it is stated to be American meat, but simply because it does not look quite so nice?—Exactly.

4314. Have you had any experience of attempting to cure that meat?—I have cured a deal of it.

4315. When it comes into this country from America, is it still in a state fit for curing?—Yes.

4316. I am not sure whether you were present; when evidence was given us by one of the witnesses that it was not fit for curing, that he had endeavoured to supply one of the steamboat companies with meat for their own use that they themselves had brought over, and that they had had to discontinue it because it was utterly unfit for them?—I did not hear that, and I dissent from it.

4317. You have tried it, and it is quite good for curing?—I have tried it, and it is quite good for curing.

4318. With regard to the steam traffic from Ireland to Glasgow, who is responsible for the badness of the arrangements there?—I do not know.

4319. But you understand that the arrangements for carrying on that traffic are thoroughly bad?

Mr. *Anderson*—continued.

bad?—They overcrowd the boats frequently, and the cattle are far too long a time in the vessel without being fed and attended to.

4320. But you do not know who is really to blame for it?—I do not.

4321. These malpractices continue even at the present day, I understand?—Certainly; the reason, I think, why the foreign cattle are less subject to foot-and-mouth disease than the Irish cattle are is, that they get better attention on board the steamers. They have a longer voyage to undergo, and they are better cared for on board the vessel, and they come in better order than the Irish cattle.

4322. Are there not better arrangements made for taking care of them on the way?—Yes.

4323. But you know no reason, do you, why better arrangements might not be made for the shorter voyage?—Clearly not.

4324. It is simply that they aim at cutting the expenses down too low?—That is so.

Mr. *John Holms.*

4325. You say that you have had experience of the American meat in Glasgow from the very first?—Yes, from 12 months ago.

4326. Was it as good at first as it is now?—Just about the same.

4327. Have you any knowledge about the meat that arrives at Liverpool?—I have not.

4328. Is it the case that some arrangements are made, or are being made for bringing dead meat from Austria into Glasgow?—I have not heard of that.

4329. We have had evidence here, that meat which is killed in cold weather, keeps about six weeks; is that so?—That is all a mistake; it depends upon the weather of course, but in cold weather meat can be kept freely in this country for a fortnight or thereabouts.

4330. And in hot weather, how long will it keep?—About a week is enough then.

Mr. *Chamberlain.*

4331. What is the lowest price at which the American meat has been sold in Glasgow?—On only one occasion it was sold at 1¾ *d.* per lb. for fore quarters.

4332. Has it often been sold below 5 *d.* per lb.?—It has never been sold on an average of the carcase below 5 *d.* per lb., I believe, that is the hind and the fore quarters together.

4333. What does it generally fetch?—About 6 *d.* to 5½ *d.* per lb.

4334. And you think that that is a price which pays the American exporter?—I am authorised by the party who sends it to say, that the trade is going to continue, so that it is likely that it pays.

4335. You say that you yourself have incurred some losses in sending American meat to London?—I have.

4336. And you say that that was owing to its arriving at a time when there was a glut of meat upon the market?—Clearly so.

4337. That will continually occur in the case of the dead meat trade, will it not?—Yes, it is likely to happen.

4338. And you think that, in spite of the continual recurrence of occasions of loss like that, the trade will still go on?—Yes. It may be just double one morning what it is another.

Mr. *Chamberlain*—continued.

4339. The profits on good days will pay for the losses on bad days?—Yes.

4340. Has the introduction of American meat into Glasgow reduced the price of meat there?—Imperceptibly as yet.

4341. You do not think that you could do without the supply of live cattle?—No, we need the live cattle.

4342–3. You do not suggest that the dead-meat trade would ever be a substitute for the trade in live catle?—No. Between American meat alive and American meat dead of the same quality, there is 14 *s.* difference in value.

4344. You think that the two trades would go on together?—Yes.

4345. And you think that in the supply of a great town like Glasgow, you could not safely rely upon the dead-meat trade alone?—No, you need both.

Mr. *French.*

4346. I understood you to say that you had had a very long experience of foot-and-mouth disease?—Yes.

4347. Do you think that foot-and-mouth disease is produced by the ill-treatment of the animal as much as by contagion?—I think ill-treatment causes it first, but it is very contagious; it is difficult to say which it comes from.

4348. Have you ever known an instance in which ill-treatment has produced foot-and-mouth disease without contagion?—Cattle shipped at Dublin have been certified to be perfectly sound, and when they came to Glasgow they were suffering from foot-and-mouth disease. That may have been an overlook on the part of the inspector.

4349. Have you ever known an instance besides that?—I suppose that there have been frequent instances of it.

4350. You never knew one yourself?—No, I do not import.

4351. Have you ever had an instance come under your knowledge of an animal that got foot-and-mouth disease merely from being ill-treated?—The cattle are certified to be sound when they are shipped, and I have seen them with the foot-and-mouth disease on the very day they were landed.

Mr. *Ritchie.*

4352. What proportion does the importation of American meat bear to the consumption at Glasgow?—The Messrs. Bell have imported 12,000,000 lbs. during the last 12 months.

4353. What was the consumption of meat altogether in Glasgow during that time?—I never summed up what the total consumption would be.

4354. You do not know what proportion the American dead meat bears to the consumption in Glasgow?—It might be one-sixth or one-seventh.

4355. Do you believe that it is as much as one-sixth or one-seventh?—I should think so from the number of cattle killed.

4356. You are not prepared to speak as to that?—No.

4357. What effect do you think that it would have upon the price of meat in Glasgow if the importation of live animals were prohibited?—It would be likely to raise the price.

4358. You do not believe that it would be

Mr. *Hamilton.*

13 June 1877.

Mr. *Ritchie*—continued.

made up by the increased importation of dead meat?—No, because the dead meat sells at a cheaper price than the same article killed in Glasgow.

Mr. *King-Harman.*

4359. In the case of those American cattle that you import, have you to finish them after they land?—No, they are well finished.

4360. But you say that they have been so many days on board ship, and then they have to remain 12 hours before they can be removed; do you move them then straight to the slaughter-house, or do you put them on the grass?—It is advisable to give them a little feeding to replenish them after being so long on board.

4361. But that is simply to freshen them after the voyage, and not that they want any extra finish?—Yes.

4362. In the same way with the Danish cattle; do you have to finish them at all?—No, they are all ready. They are in a little fever, and they are better for being rested.

4363. Were there not two or three instances, when the dead-meat trade was first started, in which cargoes came in bad order to Glasgow; was there not a whole cargo lost on one or two occasions?—No.

4364. Not during the very hot weather of last year?—No, there was only one occasion where a cargo was sold at a reduced price.

4365. Was none condemned?—None was condemned.

Mr. *Dease.*

4366. Do you buy any large quantity of Irish cattle?—Yes.

4367. Do they hold a high place in the market at Glasgow?—They are regarded as very useful beasts.

4368. Is it your opinion that beef could, with advantage be imported from Ireland in a dead state, as it now is from America?—The thing is practicable, but I do not think that it would pay. Dead meat brings about 1 *d.* to 1½ *d.* per pound, according to circumstances, less than the same articles killed fresh would do; and that is a serious tax.

4369. It would be, then, a direct loss?—Certainly it would.

4370. Would the difference of the offal make up that loss?—There is too much made of the offal, the offal is but a small thing. The offal consists more of the hide and tallow, which is always saleable, and the balance, the tripe and the heart, and so on, is made up into preserved meat. Too much is made of that question altogether.

4371. How much would the offal of a beast weighing say, 6 cwt. be worth?—Just about 3 *l.* It averages about 1 *d.* per pound on the weight of the animal.

4372. That would make up the difference in value between the live and dead meat, would it not?—No; I am not speaking of the value of the carcase irrespective of the offal. Were we to get beef from Ireland in the carcase it would be 1 *d.* per pound less than the animal would bring in the market, and then 1 *d.* to ¾ *d.* less again.

4373. It is your opinion, therefore, that it would be a direct loss to import the meat in a dead state from Ireland?—Certainly.

Mr. *James Corry.*

4374. Is it from Canada or from the United States that the live stock is imported?—From both.

4375. Are you aware whether arrangements are being made to carry on that importation of live stock all the year round?—It is only during the summer season that it can be imported with safety; the weather is so boisterous during winter that it would be very unsafe, and the insurance would be very high.

4376. Then you do not think that it would be possible during the winter months to import live stock to compete with the dead-meat trade?—No, it must be stopped during the winter months.

4377. The difference of freight would be very considerable between the live stock and the dead meat, would it not?—Very, and that is where the difficulty is.

4378. Are you aware whether they are fitting up the ships in that trade for carrying live stock?—I have heard so.

4379. You do not know of your own knowledge?—No.

4380. You say that, of the live stock when killed in Glasgow, the meat brings about 1 ½ *d.* per pound more than the imported dead meat?—Yes.

4381. Does that represent the difference in freight?—Yes, just about that.

4382. What is the freight of the dead meat from the United States to Glasgow?—I fancy it is about 7 *s.* or 8 *s.* per cwt., all expenses round.

4383. What is it on the live stock?—I am told that it costs from 8 *l.* to 10 *l.* a bullock to bring them.

4384. What is the average value of the bullocks when they are landed in Glasgow?—About 25 *l.* apiece.

4385. You have no fear but that a trade from America will be continued to Glasgow, both in dead meat and live stock?—Not the slightest; I have written authority from the folks in New York to say so.

4386. I suppose that the Messrs. Bell are the largest importers?—They are the only importers; that is to say, they are agents for the importers.

Mr. *M'Lagan.*

4387. Have you any experience of the importation of dead meat from any other country than America?—No, none comes to Glasgow.

4388. Does any dead meat come from the north of Scotland to Glasgow?—A small supply, but very trifling.

4389. How does that sell?—It sells pretty fairly, but at a little reduction from what our own killed meat brings; it sells at a lower value.

4390. You are aware, are you not, that large quantities of meat are sent from Scotland to London?—Yes.

4391. Does it bring less in the London market than the beef from the Scotch cattle that are sent and killed in London?—I am told not.

4392. Then, if it makes no difference in the price of the meat sold in London whether the meat from Scotland is sent dead or alive to London, why should it make a difference in the price whether dead meat is sent from Ireland to Glasgow, or whether live stock are sent from Ireland to Glasgow?—In London they want the meat every

Mr. *M'Lagan*—continued.

every morning for these cookshops, and what not, and they just buy one day's supply, consequently if there is an overstock to-morrow the price may fall from 20 to 30 per cent., and on the following day it may rise as much. The thing is very unequal and very uncertain. It is more advisable altogether to have the live cattle.

4393. I understand from the answer which you gave to the honourable Member on my left, that the difference between the prices of the dead and live meat in Glasgow arises not so much from the deterioration in the quality of the dead meat as from the loss that is sustained from the meat not being sold in time in Glasgow?—Exactly.

4394. But if there was a sufficient demand in Glasgow the meat would arrive quite as fresh from Ireland, if it was sent dead from Ireland, would it not?—It would arrive, perhaps, not quite so fresh as meat which is killed there.

4395. It would not make much difference in the value, would it?—It makes a difference in the value.

4396. The bloom would be off it, I suppose?—That is it.

4397. From the success of the importation of American dead meat into Glasgow, you think that it might be extended with great advantage to the public in this country?—Yes.

4398. Not only from America, but also from other parts of the world?—More so from America on account of the great difference of the freight in live and dead meat; the difference in freight, say from Germany, would not be very much, but from the long voyage of the live cattle, and being attended by bullock men, and getting fodder for 14 or 16 days, the freight is a very serious thing; it costs over 1 *l.* per cwt. to bring them from New York.

4399. Is there not a great difference also in the freight from Hamburg, and also from other ports of the Continent, between dead meat and live cattle?—No, dead meat comes to Glasgow from Hamburg.

4400. Why should there not be the same difference in the freight of dead meat and of live cattle from other countries, as well as from America?—The reason is that they can bring the meat from New York at about from 7 *s.* or 8 *s.* per cwt., and I fancy it would cost as much, or perhaps more, to bring it from Hamburg.

4401. Supposing, then, that the freight should be in proportion to the distance from Hamburg, do you see any reason why we should not extend the dead-meat trade to the Continent, as well as to America?—It would not pay.

4402. If the freight was in proportion, would it not pay?—No.

4403. Then you think that America is the only country from which we may expect to have dead meat, so far as your experience and knowledge go?—Clearly so.

4404. Do you think that the American dead-meat trade could be extended so much as to make us quite independent of having any live stock at all from America?—You would have plenty of meat, but people would prefer fresh killed meat.

4405. But you think that we can get abundance of that second quality of meat from America to supply the people of Glasgow with good sound meat?—No doubt; there is no fear of starvation, but they prefer fresh killed meat.

4406. Without any importation of live stock whatever?—There is no doubt of it.

Mr. *Torr.*

4407. You said, did you not, that there was a difference of 1½ *d.* per pound between the dead meat and the live meat?—That is in reference to the American meat. I proved it last week when I bought both the live and dead meat, and that is the difference that I paid; so that it is no matter of opinion, but a certainty.

4408. Is the quality of those two meats the same?—Yes, I believe they are equal.

4409. The quality of the dead meat is as good as the quality of the live meat?—Yes, the beasts were originally equally good.

4410. And yet there is a difference of 1½ *d.* per pound?—Yes.

4411. How do you account for that?—From the fact of its being 14 or 15 days killed.

4412. Do you not think that a good portion of that 1½ *d.* is from prejudice?—I am referring to the market value. The meat in Glasgow is all sold by public roup, and those are the prices that it fetched.

4413. Do you not think that when the public of Glasgow have got accustomed to this dead meat imported from America, the difference between the price of the two articles will diminish?—The Glasgow folks have had a large experience, 12,000,000 lbs. have been imported, and they have had it for a full year there.

4414. But you admit that probably the dead meat will improve in its mode of transit?—It is quite likely that it may be improved upon, but I could not hazard an opinion. It comes in very good order just now.

4415. If it were to improve in condition, the difference in price between the live and dead meat would naturally diminish, would it not?—One would argue that; but fresh meat always commands a relatively higher price than meat which has been killed a fortnight will command.

4416. Do you know sufficient of the dead-meat trade with America to say whether it has been a paying or a losing trade?—It is a delicate question. I do not know sufficient of the facts. I do not myself import; I buy at the public auctions and sell it again.

Chairman.

4417. With reference to what I understood you to say in answer to the honourable Member for Glasgow, with regard to the carrying trade from Ireland, you are aware that within the last few years certain alterations have been made in that trade, and that an inspection takes place now with regard to those vessels for the purpose of seeing that what you describe as over crowding does not take place, and seeing also that the fittings are proper; when the vessel comes in she is liable to be inspected to see that she has fulfilled the conditions for the proper carrying of cattle?—They are very necessary.

4418. Are you aware that that has been the case since 1874?—Yes, I believe it is the case.

4419. Are you aware that those fittings, and the condition of the vessels, has very materially improved since 1874?—I believe that they have improved a little, but there is still more improvement needed.

Mr. *Hamilton.*

13 June 1877.

Chairman—continued.

4420. The condition of those vessels has not been allowed to remain what it was, but they have been regulated by inspection and improved for this carrying trade?—I suppose so.

4421. I understood you just now to say that the fresh meat commands, as a rule, a higher price, and that people prefer fresh killed meat?—Certainly.

4422. I understood you, in answer to a previous question, to say that a very large amount of this American meat was sold to the customers, and that no difference was discovered by them as between the American meat and the Scotch or English meat?—It is sold at a lower price than Scotch beef.

4423. Do you mean to say that you sell to the customers this American meat at a lower price than the Scotch meat?—Certainly.

4424. And that they have it with a knowledge that it is American meat, and buy it because it is cheaper?—Yes.

4425. It is not, as was suggested by a witness from London the other day, substituted for Scotch and English meat, and sold as such?—Nothing of that kind; we are too honest in Glasgow for that.

4426. It has been stated that the meat is in such good order that the consumers do not detect the difference as between American and English meat; is that the case in Glasgow?—A person on having no experience could not be expected to detect the difference, but a butcher or a man of capacity would know at once.

Chairman—continued.

4427. The consumer is not in a position to decide as to whether the joint which is sent to him by a butcher is American or English beef, because, as you say, the American meat is of equally good quality?—They will soon learn.

4428. But at the present moment they have not discovered that?—Plenty of people can detect the difference.

4429. The consumers can?—Yes.

4430. You believe that that will prevent its coming into competition at the same price with English and Scotch beef?—It will sell as American meat at its relative value, but not as home meat.

4431. And yet it is in sufficiently good order, and it keeps as long as the English killed meat, and is of sufficiently good quality to compete with it in the market?—Yes, at its price. You know there is no beef so good as the Scotch beef, and it will not bring the same price as that.

Mr. JOHN PRINCE SHELDON, called in; and Examined.

Mr. *Sheldon.*

Chairman.

4432. I BELIEVE you live in Staffordshire?—I do, close to the borders of Derbyshire.

4433. What is your occupation?—I am a Farmer.

4434. Are you a dairy farmer or a grazier?—Both.

4435. Are you at all acquainted with the American system of farming?—I have passed a few weeks in the States, and the time was principally passed in examining the American system of farming.

4436. You have, in fact, studied the system under which they farm there?—Yes, to greater or lesser extent.

4437. Have you investigated this American meat trade?—I have in England, but not in the States.

4438. And you have been collecting statistics, I think, relating to it?—Yes.

4439. The object of that has been with the view of making a report upon it to the Royal Agricultural Society, has it not?—It has.

4440. Can you give the Committee, from your experience in America, any idea as to the number of cattle, sheep, and pigs in the United States?—In round numbers there are 28,000,000 cattle of all kinds in the States; 36,000,000 sheep, and 26,000,000 pigs.

4441. What number would that give as available annually for slaughter?—It would give something like 8,000,000 cattle annually available for slaughter, 12,000,000 sheep, and 20,000,000 pigs.

4442. Can you state what the average weight of the animals was?—Those that are sent to England average about one-third of a ton net; about three to a ton.

4443. Can you state what available balance there is for export from America?—If the Americans were to eat as much as we do in England, that is, 100 lbs. per head of the population, they could, out of their surplus stock spare us considerably more meat than we in England eat altogether.

Chairman—continued.

4444. What is the present population of the United States?—It is estimated to be now 44,000,000.

4445. Did you at all make yourself acquainted with the cost of rearing and feeding a bullock in America?—No, but I have reliable information as to the cost from men in America.

4446. Is that information obtained from men upon whose accuracy you can depend?—Yes, one of them is Professor Morrow of the Illinois Industrial University, and if you will allow me I will read a short extract from his letter on that point. He says, "Corn can be produced for, say from 20 to 25 cents per bushel of 56 lbs. of shelled corn. A steer weighing 1,500 lbs. will have eaten about 100 bushels of corn. This has been fed to him unground, unshelled, and often unhusked; the stalks, if they have been kept in good condition, being valued as not far inferior to hay. The only other food has been grass in summer and a little hay in bad weather in winter. This steer will be worth here from 75 dollars to 90 dollars, and will give a good profit. Or a steer, two years old, thin in flesh, may be purchased now for about 30, weighing say 900 lbs. During the summer he will be grazed, and next winter will be fed, perhaps 35 or 40 bushels of corn, and be sold either during the winter or in summer for about 60 dollars or perhaps 70 dollars;" that is to say, from 12 *l.* to 14 *l.* From the Province of Ontario, I have a calculation that the cost of raising and fattening a steer

Chairman—continued.

a steer, which, when fat, would weigh 1,600 lbs. gross, would amount to 66 dollars or 13 *l.* 4 *s.* A beast of that size, net weight, would weigh 912 lbs., and that at 6 *d.* per lb., would come to a little over 22 *l.* 10 *s.*

4447. We may take that then to be the average cost of a fed bullock?—Yes, I think from 60 to 70 dollars.

4448. There is a considerable railway transit before you bring him to the slaughter-house, is there not?—Yes, there is a considerable railway transit. From Chicago to New York, which is a distance of 900 to 1,000 miles, the railway transit amounts to eight dollars per head of cattle, or 32 *s.* That does not include feeding and attention on the way.

4449. Can you state what the actual cost, including everything, would add to the purchase price of a beast before you got him to New York?—Certainly not more than 2 *l.* per beast, including freight.

4450. Then there is the process of slaughtering and packing in New York?—Slaughtering alone is estimated to cost, on the average, 25 cents, or about 1 *s.* per head, and the packing will be about the same, I presume.

4451. That is the process by which the beasts are prepared there before they are sent over?—Yes. The slaughtering alone would cost 1 *s.*, and the process perhaps another 1 *s.*

4452. Would that include the whole cost before the carcase was placed on board ship?—Yes, I believe so.

4453. You have, I suppose, gone into the question of the way in which they bring over the meat at present from America?—Yes, I have inspected the meat on board several ships in Liverpool.

4454. We have had it described in evidence here, that the process of refrigerating the meat after slaughter takes place before they put it on board ship for transit to this country?—Yes, the carcases, after the beasts are killed, are prepared on shore, and they sometimes remain there for two or three days before they are but on board ship.

4455. I want to know what the cost of all this preliminary process would be which you would have to add to the cost of the live meat?—I have not been able to ascertain the exact cost of that preliminary process, but it cannot be much, taking it on the average.

4456. Then there is the freight on the dead meat; what is that?—The ocean transit of dead meat costs about 30 *s.* per carcase, or about a half-penny per pound.

4457. Does that cover the expense of the displacement by the chamber in which the meat is conveyed, and the ice and everything that maintains the temperature during the passage?—That is based upon the ship's measurement of displacement. One carcase weighing one-third of a ton is supposed to occupy what is called a ton space on board ship; there is so much space lost in hanging.

4458. It has been stated in evidence before this Committee that certain cargoes have arrived when not too closely packed in perfect order, but that again when the trade in America wish, for the purpose of reducing the price, to send over too large a supply, you get the meat too closely packed, and deterioration takes place; do you agree in that?—That is a mistake; in the

Chairman—continued.

cargoes I have inspected the quarters were packed closely, "interlocked," to avoid bruising by the roll and pitch of the ship.

4459. I wanted to know whether you were giving this allowance of space on the idea that it was one of the cargoes that arrived in perfect condition?—This would be an average estimate, of course; sometimes the meat would be packed closely, and at other times it would not; but its being packed closely does not interfere with the keeping properties of the meat.

4460. You say that one carcase is calculated to occupy a ton of space; is that calculation framed upon a cargo which has come over, and which experience has shown to have been delivered in good condition?—I could not say that.

4461. But you do not know whether that allowance of space is the proper allowance?—I cannot say that, but I presume that it is.

4462. We have got the average price of the animal to be 14 *l.*?—Yes.

4463. We have got the carriage of it to New York to be about 2 *l.*, including all expenses?—Yes.

4464. Then there are the expenses of about 2 *s.*, or something more, to get the carcase on board the ship?—Yes.

4465. And then there is carriage of the carcase in the ship to this country?—The carriage from New York to this country is about 30 *s.* on the average.

4466. That brings it to about 18 *l.*, does it not?—Yes, about 18 *l.*; that might be taken as the fair average, I think, for the delivery in Liverpool.

4467. Could you compare that with the cost of bringing over the live animal?—I have done so. The charges of the steam-ship companies per head of live cattle are 35 dollars, or 7 *l.*

4468. Is that the regular price, or is it a Canadian price?—That is the Canadian price.

4469. I think we understood a witness to say that it was less from other parts?—I should doubt it, because the distance is shorter from the Canadian ports than from the United States ports.

4470. It was stated that competition, or something of that kind, had reduced it to 5 *l.* or 6 *l.*; are you aware whether that is so?—I have my information from three or four different sources, and they exactly agree that it is 35 dollars, or 7 *l.* per head; besides which, the exporter has to pay 3 dollars per head for fittings on board, and 5 dollars per head for attendance and food; that brings it to 43 dollars, or 8 *l.* 12 *s.*

4471. And you would have to add that to the 16 *l.* which it had cost to rear and fatten the beast, and to bring it to New York?—Yes.

4472. So that the profit on the dead meat to the exporter is very considerable?—Very considerable.

4473. Can you tell the Committee whether there is more than one process in use by which the meat is being sent over from that country?—There are two or three rival processes still in use, and one or two have been discontinued, I understand; but I have only personally inspected one of them, which is generally taken to be the best.

4474. At what port?—At Liverpool.

4475. Is that the process that was described to the Committee the other day by Mr. Gillett as the one by which the chamber was kept cool

Mr. Sheldon.

13 June 1877.

Chairman—continued.

by ice being forced through tubes?—No; it is not that process.

4476. What is the process which you yourself have inspected?—It is generally known as the "dry air" process. The air is made to pass through the ice-room, and then it is made to pass through the meat-room, and a continuous circulation of air is kept up in that way.

4477. Have you tested the meat coming over under this process, as compared with the meat which is sent over by the other process?—I have not.

4478. But you can speak with regard to the condition in which the meat arrives under the process that you have inspected?—Yes; I have been present when the meat-room has been opened at Liverpool.

4479. Would you describe to the Committee whether the meat was in sound condition when it was brought out?—Yes; the meat was simply in perfect condition. There was scarcely even a faint odour that was disagreeable; certainly not more than you would find in an ordinary butcher's shop, and scarcely so much. The meat was quite firm, and not discoloured; and the juices of the meat I found had not run so as to discolor the cloth which is wrapped round the meat.

4480. Do you know whether the same process is adopted in America with regard to this import that has been described as regards the preparation of the meat after the slaughter?—Yes; it is used in the preparation of the meat, I know; but whether it is used by all I do not know.

4481. In both cases the meat after slaughter is cooled down before it is put on board the ship?—Yes; in all cases it is cooled down.

4482. So as to get rid of the animal heat, which might otherwise produce deterioration?—Yes.

4483. You state that you have tested this particular mode of bringing it over?—Yes; I have examined and inspected the ship, and the meat rooms, and the meat itself.

4484. But you do not compare it with the other mode?—I cannot. I have not inspected the other at present.

4485. I understood you to say that you inspected the meat on arrival, and that then there were no signs of its being in any way the worse for its voyage?—Not the slightest signs.

4486. Did you follow that meat at all, so as to be able to test whether, after it had left that chamber, it could resist the new atmospheric influence?—Yes, I did in one case. I went over the steam-ship "Celtic," in Liverpool, in March; and on the following day, in Manchester, I purchased, for experiment, a piece of beef that was brought over by that ship. I was careful, of course, first to ascertain that the meat had been brought by that ship. I took the meat home, and kept it for several days before cooking it, and it was kept several days afterwards before it was finished, and I invited several friends to taste it, and, both warm and cold, the meat was very good.

4487. You did not discover in it what has been described by one witness as any falling off in flavour when the meat got cold after being cooked?—No, it did not fall off at all; it ate like ordinary good English beef when it was cold.

4488. There was nothing in what you saw to lead you to think that it would not be able to compete fairly with English meat in the market?—I considered, and so did my friends, that it would compete on even terms with English beef, so far as quality and flavour went, from a consumer's point of view.

Chairman—continued.

4489. In the time during which you hung this meat, after having purchased it, did you see any sign of its deteriorating or decaying?—There was no distinct sign of decay beyond the fatty portions of it becoming a little discolored; they went a little reddish.

4490. You have never tested the thing so as to see whether the same thing happened to fresh killed meat when hung?—Not to the extent that it does to the American meat.

4491. Was the experiment which you made tested during the hot weather, or in the cold months?—It was in the month of March, but not in good keeping weather just then.

4492. Was it in what people call muggy weather?—In muggy weather.

4493. During the time that it remained exposed to the air, and therefore exposed to the new atmospheric influence, you saw no signs to convince you that it could not come as an article of food into this country?—No, not any.

4494. And you say, also, that its cooking qualities are not inferior to those of English killed meat?—It is quite up to the average of English beef, I think.

4495. Under those circumstances what do you, yourself, after looking at the whole question, consider will be the future of this trade?—The trade is destined to increase to an extent that I am not able to give an opinion of at all; but certainly to a very large extent.

4496. I understand you to found your opinion upon the fact that they have in America a supply which is almost unlimited, and far in excess of their own actual wants for consumption, and that they can produce it at such a price as to be able to send it over here at a remunerative profit to compete with the English beef?—Undoubtedly. For a long time to come the American production of meat may be considered to be practically unlimited, and at the present prices they will send it over to us very freely.

4497. I suppose you mean by the present prices a price of between $5\frac{1}{2}$ *d.* and 6 *d.*, which they have described to be remunerative?—Yes.

4498. Do you think that at a price of 6 *d.* per pound the Americans will be able to keep the market fully supplied?—Yes, at the present prices as they go; of course they fluctuate a little, but, taking them altogether at the present prices, when the arrangements are completed, the Americans will send us, I think, as much meat as we want.

4499. What, in your opinion, was the reason of the losses that have been stated to have been incurred on a number of cargoes that have come over in consequence of the meat not being in good condition; was it from an accident, or was it one of those permanent conditions to which the trade will always be liable?—You could only regard it as a permanent condition, in so far as a possible accident may be so regarded, as a thing that will occur now and then; but I believe that in almost if not in all the cases in which meat has turned bad on board ship it has been owing hitherto either to an accident or to an insufficient supply of ice.

4500. In fact, you endorse the statement which has been made that the trade is in its infancy, and making

Chairman—continued.

making experiments?—Yes, they are gradually feeling their way now.

4501. And, therefore, when it does occasionally happen that a cargo comes over in bad condition, it is not from a fault in the system under which it might be sent, but it is from one of the accidents of the undeveloped condition of the trade?—It is from no fault that can be attached to the system, but from some details having perhaps been overlooked, or from some accident.

4502. Do you think that experience will in time do away with these defects, and that a permanent trade, without fluctuations from such losses, will be secured?—In my own mind, I have not the slightest doubt of that.

4503. Do you think that these prices, when the trade is so secured, will be maintained in England?—That depends upon the amount of meat that the Americans send to us; of course if they send to us a very great quantity the prices will go down.

4504. In your own judgment, from the way you have studied it, do you think that this is merely an experiment to establishing a market, or do you think that it is a permanent remunerative price, which will keep the trade in existence, when once it is established?—I think that the trade has already passed out of the boundary of experiment, and has become an established branch of commerce.

4505. And you do not think that when once the trade is established, and there is some dependence upon it in this country, the prices will then rush up suddenly?—I do not think it is at all likely that they will.

4506. But it will be still sufficiently remunerative in America to make it worth their while to send the meat over at the same prices?—Yes, I think so.

4507. Have you any statistics which you could give the Committee which would confirm your opinion that this trade would be a permanent one?—I have some figures which I think will tend to show that the trade is no longer an experimental one. The first American dead meat was sent over from New York in October 1875, to the amount of 36,000 lbs. weight; it was the same amount the following month; and in December it went up to 134,000 lbs. weight of fresh beef.

4508. Are you thinking of the whole import into the country, or only of the import into Liverpool?—I am speaking of the whole export from America to this country. In January it went up to 162,000 lbs.; in February it was 292,000 lbs.; in March it was 302,000 lbs.; in April it was 1,256,000 lbs.; in May it was 1,012,000 lbs.; in June it was 1,140,000 lbs.; in July it was 1,170,200 lbs.; in August it was 1,365,000 lbs.; in September it was 2,451,550 lbs.; in October it was 2,569,075 lbs.; in November it was 2,974,480 lbs.; in December it was 3,036,900 lbs.; in January of the present year, it was 1,796,000 lbs.; in February it was 3,605,610 lbs.; in March it was 6,262,355 lbs.; and in April it was 6,022,013 lbs. That is from New York alone. The export of mutton does not appear to be sufficiently important to induce the Government at Washington to give the statistics of it at present. From Philadelphia the trade commenced last October, the trade from New York having commenced in the previous

Chairman—continued.

October. From Philadelphia last October were sent 150,610 lbs.; in November, 1,219,500 lbs.; in December, 737,500 lbs.; in January, 776,450 lbs.; in February, 1,348,000 lbs; and March, 445,500 lbs.; and in April 2,546,200 lbs. were sent.

4509. Those figures show a steady progress in this trade?—Yes, except for fluctuations.

4510. And they show also, that during the hot weather no perceptible difference has been made, because the progress was still steady?—Yes.

4511. In your opinion, does the hot weather make any real difference in the possibility of this trade becoming permanent?—Not the slightest, so far as transit is concerned.

4512. Do you agree with the witness who stated that the cargo that came over in the best condition, came over in the hottest weather of last year, both in New York and in England?—I believe it is quite possible that the best cargo might have come then.

4513. There is nothing in fact in the nature of the weather to interfere with the trade?—Not in the slightest.

4514. Have you at all thought of the question as to the importation of live cattle from the continent?—Being a farmer myself, I am naturally interested in that question.

4515. What are your own views upon it?—I consider that the importation of cattle into England, from the continent, ought to be totally prohibited.

4516. You found that opinion upon the ground of wishing, by that prohibition, to eradicate cattle diseases from this country?—Yes, on that ground, and, of course, on that ground alone.

4517. And you believe that those restrictions would really eradicate those diseases?—Yes, I believe that those contagious diseases would soon pass away from this country, if the importation of cattle were prohibited.

Mr. *Ritchie.*

4518. Are you referring to cattle plague, or to the other diseases as well?—To cattle plague more particularly, but I would include also the others.

4519. Of course you are aware of the fact that pleuro-pneumonia and foot-and-mouth disease are very widely spread throughout the country now?—Yes, I am quite aware that those two diseases may almost be considered as naturalised to the country now, and I am afraid that cattle plague will soon be naturalised to the country unless something is done to prevent its re-introduction.

4520. I understand you to say that you think that the importation of cattle should be absolutely stopped, in consequence of the danger of the importation of cattle plague?—Yes.

4521. Dealing with the other two diseases, pleuro-pneumonia and foot-and-mouth disease, do you think that the importation of cattle should be stopped also in consequence of them?—I do not think that it is so necessary with regard to those two diseases as with regard to cattle plague.

4522. It is solely on the ground of protecting the country against cattle plague that you would impose these restrictions?—Mostly on that ground.

4523. I suppose you would admit that the

Mr. *Sheldon.*

13 June 1877.

Mr. *Ritchie*—continued.

country is at present in a great measure dependent upon the foreign supply?—Yes, and it always will be, so long as our own flocks and herds are destroyed by diseases coming from foreign countries.

4524. But it would take some time in case of any restrictions being imposed before our own flocks and herds could be increased very largely I suppose?—Yes, it would take us some time, and it would require a good deal of care, to eradictate those diseases which have become almost natural to the country now, such as foot-and-mouth disease and pleuro-pneumonia.

4525. Supposing restrictions to be imposed in this country to stamp out those diseases, and your idea being carried out of stopping the import from abroad, how would you propose to meet the consumption in the country during the interval between the time of your stopping the import and the growth of your home supply?—They must send us their meat dead as the Americans do.

4526. Do you believe that that trade could be created on the Continent?—I cannot see why it should not be created on the Continent.

4527. I suppose you would admit that the possibility of a dead-meat trade would depend upon the value of the animal on the Continent combined with the cost of sending the dead meat to this country?—It would equally so depend, I presume, in the live cattle trade.

4528. But where it is possible to get a remunerative trade out of the American meat in consequence of the price of the live animals in that country, it might not be possible to make it a remunerative trade from the Continent if the price of the live animal is very much higher there?—I do not see what that has to do with it at all, because they can certainly bring it cheaper dead than alive.

4529. It was stated in evidence before the Committee of 1873 that the trade between the Continent and this country fluctuated according to the price here and the prices in Paris, and that a load of animals would come as far as Mayence, and wait for a telegram showing what the prices were, before it was directed to either one capital or the other; supposing that the import to this country was entirely stopped, and that we trusted to the dead meat, would not the whole stock go into the open market, which would be the Paris market?—The Paris market would not require the whole of the stock; but even if they took it all, after a short time the prices would go down so low that the Germans would soon begin to try the dead-meat trade with us.

4530. You believe that they would after a time be forced into a dead-meat trade with this country?—I do; and I believe that in a very few years they would wonder why on earth they had not taken it up before.

4531. Do you think that the people of this country during that interval, would suffer from the want of a supply, whilst the new trade was being brought into existence?—I do not think that they would suffer long, for the Germans would very quickly begin the new trade, I believe. They are rather fond of English gold and they would have it.

Mr. *Assheton.*

4532. I want to ask you some questions about

Mr. *Assheton*—continued.

foot-and-mouth disease in your capacity as a dairy farmer and as a grazier; I hope you have not got the disease at present on your farm?—No, I have not got it now, I am thankful to say.

4533. I presume you do not wish to have it?—Not in the slightest.

4534. One or two witnesses, and especially a German gentleman, spoke very slightingly indeed of the disease; he said that it was here to-day and gone to-morrow, and he did not seem to care very much whether it came to his stock or not; is that your view of the disease?—No, indeed it is not. I should rather keep it at a very respectable distance, if possible.

4535. Supposing that you unfortunately heard that the disease had broken out in your dairy stock, how much a head should you think you would be a loser by?—A great deal depends on the time of the year when you have it. If I had it now, I should reckon the loss to be very great, because the cattle are in full flow of milk just now. I had it last autumn but one, but then the loss was not so great as it would have been if I had had it earlier; the weather was also colder, which helped me; but at that time I reckoned the loss at not less than 4*l.* per head on the dairy stock.

4536. Supposing that it should attack your grazing stock, your stock of beasts, say half fat now, how much a head would it take off them?—I do not think that it would take so much, but it would take a great deal off them; it would throw them back a greater or less time in their feeding, and you lose that time, which is money. But it is very difficult to give an estimate with regard to feeding stock in that way. Some have it very badly too, and others have it mildly.

4537. If you had it all round would 2*l.* per head pay you for the loss?—I should not consider that 2*l.* a head was sufficient for the loss.

4538. You are aware that there are certain restrictions now in the country in consequence of foot-and-mouth disease; do you as a farmer complain of those restrictions?—I hardly know what to say to that. We do complain of them certainly, but we should not complain of them, if, by having them kept on for a time, we could do away with their future necessity. I mean that if we did not get these diseases imported from the Continent in the future, if we could depend upon not having any foreign diseases brought to us by live stock in the future, we should be quite willing to submit to a good deal of inconvenience now in order to get rid of those that we already have. Looking thus to the future, we should be satisfied with the present.

4539. Should you like to hear that the present restrictions as to the movement of cattle affected with foot-and-mouth disease, and as to the holding of fairs in certain districts, were all removed?—Decidedly not.

4540. I understand that you and your fellow farmers would submit to even greater restrictions if you thought that there was some chance of eradicating the disease?—Yes; we would submit to almost anything for a while.

Mr. *Jacob Bright.*

4541. You have spoken a good deal in your evidence about the imported diseases, have you not?—I have.

4542. Do

Mr. *Jacob Bright*—continued.

4542. Do you assume that all cattle diseases come from abroad?—I assume that they either do or have done at some time or other.

4543. What makes you assume that?—I believe it is understood so or admitted so by the veterinary faculty.

4544. That is to say, it is not on your own knowledge, but you assume it from what you have heard?—I assume it from the investigations of other men.

4545. Are you not aware that even among the veterinary witnesses of whom you speak, there is a considerable difference of opinion, and that there is no great certainty as to whence these diseases come?—I am not aware that there is any great difference of opinion between the best authorities on that subject. I have not myself come across any such difference of opinion.

4546. Has it not been a matter of dispute as to whether the cattle plague of 1865 came to this country, or originated in this country?—I have never heard that it was doubted that it came from Germany.

4547. You have never heard that there are countries on the Continent which believe that they got it from us?—I have never heard that.

4548. Did you ever hear of a terrible cattle plague that occurred in this country 100 years ago?—Yes; I have heard that spoken of.

4549. It was a cattle plague that produced great devastation?—Yes.

4550. You are aware that there was such a cattle plague?—I have simply heard it casually spoken of. I have never seen any statistics or any particular information about it.

4551. Are you aware that that plague sprung up in the middle of England; I believe in the county of Warwickshire?—I have understood that that plague also came from the Continent.

4552. Can you tell us how it came?—No, I have no idea; and probably no one has now.

4553. If it sprung up in the middle of England, when we had no trade in cattle with the Continent, you would think it rather curious, would you not?—If it were distinctly proved to have done so I certainly should think it curious.

4554. You would think it curious that it should have come from the Continent and sprung up in the middle of England without our having any trade connection in cattle with the Continent?—It might have sprung up there as well as in any other part of England, if cattle came from the Continent.

4555. Many things are possible?—We can only speak as to possibility with regard to 100 years ago.

4556. We have some history about it?—The history about it, I believe, is very imperfect, and very obscure, and not to be depended upon.

4557. You assume absolutely that all diseases of cattle must come from abroad; did you ever hear of any disease of cattle in this country in the years just preceding the time when we admitted foreign cattle; I mean in the years 1840, 1841, and 1842?—Are you speaking now of any other diseases besides the three that I have been talking about?

4558. I am not speaking at the moment about cattle plague, but of cattle diseases, foot-and-mouth disease, and pleuro-pneumonia?—I am not aware that either of those diseases was in the country previously to 1840 or 1841.

Mr. *Jacob Bright*—continued

4559. You are not aware that they were in the country previously to our free importation of cattle?—No; from the best information that I can obtain the first case of pleuro-pneumonia occurred in Ireland about the year 1840 or 1841.

4560. You admit that?—That is from the best information I can obtain on the subject.

4561. Was not that before we imported cattle from abroad?—The disease on that occasion was introduced by some cows which came over from Holland, and it is distinctly traced to have come by them.

4562. Where did you ascertain that fact?—It is now some two years since I had occasion to ascertain it, and I forget the authorities, but I could find them out.

4563. If we had no connection whatever with the cattle trade of the Continent, would you expect this country to have complete immunity with regard to the diseases of cattle?—I could not say that with certainty. I do not know whether we have not played with an edged tool until we have got very severely cut. I am afraid that we have allowed these diseases to come from the Continent so long that they have become indigenous to the country at last. Still, I hope, they may be stamped out with proper care and sufficient restrictions; but no restrictions have hitherto been sufficient.

4564. You do not propose to shut out foreign cattle on account of foot-and-mouth disease and pleuro-pneumonia?—Not so much on account of those diseases as on account of cattle plague.

4565. Would you shut out foreign cattle on account of those diseases?—Yes; I think that those two diseases provide sufficient reasons for totally shutting out Continental cattle.

4566. You would shut out foreign cattle totally, even if there was no such thing as cattle plague?—Yes; I think that the other two diseases provide sufficient reason for that.

4567. Of course you would think yourself ten times more justified in shutting out cattle plague?—Very much more so, certainly.

4568. But for foot-and-mouth disease and pleuro-pneumonia, you would absolutely shut out foreign cattle from this country?—Yes.

4569. You would shut them out from the countries that are even freer from disease than our own; you would shut them out from a country that is absolutely free from disease?—No; if you could prove that a country was absolutely free, I would not prohibit the importation of live cattle from it.

4570. Then you would not shut out all cattle for pleuro-pneumonia and foot-and-mouth disease?—Yes, I would, for this very reason, that you could not prove that a country was totally free.

4571. Then you would and you would not at the same time?—No, I do not say that; or I did not intend to, at all events.

4572. Would you or would you not?—I would shut them out, decidedly, for this reason, that you could not be sure that the countries from which you would like them to come would be free from disease. At the same time, if you could distinctly prove that a given country was perfectly free from disease of all kinds, then I would

Mr. *Sheldon*.

13 June 1877.

Mr. *Sheldon.*

13 June 1877.

Mr. *Jacob Bright*—continued.

would not shut the cattle out from that country. That is my yes and no.

4573. If you had the power to do it, you would shut them out to-morrow?—Yes, I would, decidedly; not in the interests of the farmers alone, but in the interests of the general meat-consuming public.

4574. Do you know what is the proportion of meat that comes from abroad?—I do not know; it is given variously at from 5 to 10 per cent. of our consumption.

4575. If you take away 5 or 10 per cent. of any important article of consumption, it has a great effect upon the price, has it not?—I do not see that it would now, because a new trade with America has risen up, which would easily supply that want, and more.

4576. Do you know what proportion of our meat supply comes in the shape of dead meat from America?—No; I have not carried out those figures, but it would be a very easy matter to do so.

4577. Then how can you offer an opinion that the American dead meat would fill up this vacancy?—Because I know that America has resources which would enable her to send us far more than we get from the whole Continent of Europe.

4578. Still, we have had no great quantity yet. The meat of the cattle that come from abroad is vastly more in quantity than any dead meat supplied from America?—The Americans have hitherto been feeling their way in this trade, and now that they begin to feel their feet on the bottom, the trade will shortly branch out into very large proportions.

4579. Seeing that you would shut out cattle from every country in the world because of foot-and-mouth disease and pleuro-pneumonia, what restrictions would you adopt in this country to get rid of those diseases?—I should adopt those which are at present in force, until the diseases had vanished.

4580. But would those restrictions which are at present in force get rid of the disease?—That is more than I can say. I hope they would.

4581. Would you adopt any more?—I would try these first, and if they did not succeed, I would try something more severe.

4582. If you shut out the cattle from the different countries of the world for foot-and-mouth disease and pleuro-pneumonia, do you fancy that there is no portion of the population of this country that would have something rather unpleasant to say about that?—Yes, no doubt they would; they always speak unpleasantly about a thing that touches their pockets, and that they do not thoroughly understand.

4583. You think that they do not understand it?—I believe that they have not worked up the bearings of these diseases upon the meat supply of this country; they look at it purely from their own stand-point, which is a thoroughly selfish one as a rule.

4584. They look at it from the consumer's stand-point?—Yes, they are not producers, and therefore they have no sympathy with the producer's stand-point.

4585. In fact, they want to get meat at the market price of the world?—Yes, but they take just the wrong way to do it.

Mr. *Jacob Bright*—continued.

4586. That may be your view; you may be right, or they may be right?—I admit that I may be perfectly wrong, but those are my views.

4587. However, you would take strong measures, and you would for much smaller diseases than the cattle plague imperil the meat supply of this country?—I do not consider in my own mind that it would imperil it by any means, but the contrary. I cannot regard it in that light. I think it is an entirely imaginary grievance to regard it in that light.

Mr. *Torr.*

4588. Your simple idea is, that if you could stamp out the diseases which you think are imported from abroad, instead of imperilling the meat supply of this country you would make it a more permanent one?—Yes; and ultimately (and soon, I hope,) you would reduce the price of beef to the consumer.

4589. As my honourable friend put to you, there would be rather a serious gap to get over as between now and the time when your measures shall have increased the home supply?—Yes; I admit that there is a serious gap to get over, but we shall never get over it unless we try.

4590. But you meet it by saying that this new source of supply from America would cart us over that gap?—Yes; I believe it is able to do so.

4591. You have given the Committee some very valuable statistics, and probably the Committee would like to know what was your object in getting these statistics?—I have been asked by the Royal Agricultural Society to do so.

4592. It was not with the object of laying them before this Committee?—I commenced these investigations a considerable time before this Committee was thought of, or before I knew of it, at all events. They were got together solely for the Royal Agricultural Society, and it is only some two or three weeks ago at the utmost that I had it intimated that it was possible that I might have to give some evidence before this Committee.

4593. You do not think that an additional price would need to be paid in this country for the dead meat supplied from America, to ensure its permanency?—No; from the best information that I can gather on the other side, at the present prices they are prepared to send us very large quantities, and it pays them very well.

4594. It is not likely that the price in New York will rise to an extent that would diminish the export?—I do not see how it is possible to raise the prices seriously by any means.

4595. Do you think that an increased export of meat from America would tend to raise the freights on the different lines of steamers to this country?—I think it is likely that it may raise the freights a little, but the Americans are not calculating at all upon a rise of freights.

4596. A steamer can bring over a much larger amount of dead meat than she can of live meat, can she not?—Yes; a very great deal more.

4597. From America and from the Continent?—Yes.

4598. And consequently at a much cheaper rate?—Yes.

4599. What

Mr. *Dease.*

4599. What difference in the retail price of meat per lb. between New York and London?—I am not aware what the retail price is now in New York, but I think that the retail prices in New York bear no relation whatever to the wholesale prices.

4600. What is the difference between the wholesale prices in New York and London?—I do not know what the wholesale price in London now is. In Chicago, for the week ending May the 19th, choice graded steers were worth 5 dollars 40 cents. to 5 dollars 60 cents. per 100 lbs. gross weight; that amounts in net weight to 4¾ *d.* per lb.

Mr. *King-Harman.*

4601. You say that in the States there are 28,000,000 cattle, in round numbers?—Yes.

4602. Does that include Texas?—That includes Texas.

4603. You said that that would leave available 8,000,000 for slaughter?—Yes.

4604. Do you consider that that surplus arises from an accumulation of animals in consequence of their not having had a market in the States for years, and that the animals have been slaughtered for hide and tallow?—There is no accumulation since 1870 to the present time; the numbers stand about the same; they accumulated rapidly until the year 1870; since then they have been knocking the bull calves on the head a good deal in America, simply because they were worth more money dead than alive; they wanted them out of the way.

4605. Then if the idea was put abroad that the large supplies of meat coming to us arise from a surplus which is now being diminished by the exports from America, that would be an erroneous impression?—The exports from America cannot be looked upon as sensibly diminishing the stock of cattle in America. We have only had some 53,000 cattle in the way of dead meat from America, and that is a mere drop in the bucket.

4606. You stated, I think, that you considered "that the Americans would be able, after feeding themselves, to export more meat than we at present consume in England at the rate of 100 lbs. per head of the population?"—Yes.

4607. Do you consider that they can breed sufficient to keep that up?—Yes, and to double it after a time, and more than that.

4608. And in that 28,000,000 you only include the States?—Yes, the States and territories.

4609. You have not included South America, Buenos Ayres, and so on?—No, nor Canada.

4610. Have you read the evidence of Professor Brown and Professor Simonds?—No, I have not.

4611. You say that you are not aware that pleuro-pneumonia and foot-and-mouth disease appeared in this country when imports were prohibited, that is to say, that they appeared about 1841 or 1842?—I understand that pleuro-pneumonia appeared first in this country about the year 1840 or 1841.

4612. And you have heard that accounted for by the import into Ireland of Dutch cattle?—Yes.

Mr. *Elliot.*

4613. You say that you would undergo very grave restrictions to get rid of the disease that now exists in this country?—Indeed, I would.

Mr. *Elliot*—continued.

4614. Would you rather undergo the restrictions of the Privy Council, or of the local authority?—I do not know that I should distinguish much between them; I should not care how severe they were so long as they effected the object in view. They must be made sufficiently severe to effect that object, I think.

Mr. *Ritchie.*

4615. I understand from your evidence that you do not agree with Professor Brown in his answer to this question: "I understood you to say that if your idea of prohibiting the importation of live stock from Germany were carried out, the probability is that it would raise the price of meat?—I think there is a doubt that it would raise the price of meat; it might raise it, but I do not think that it could raise it much, and I doubt if it would raise it at all, especially after a little time.

4616. I understand you to say that absolutely, in your opinion, it would not raise the price of meat?—Eventually, I feel confident that it would not raise it, but lower it.

4617. And your reason for thinking that is, that the supply which we now receive from the Continent alive would probably come dead, in addition to the supply that would come from America?—Yes, at all events a good portion of it would come dead.

4618. I think you said that your reason for believing so was because they can send it cheaper dead than alive from the Continent?—Yes, and because they want our money too.

4619. If they can send it cheaper dead than alive from the Continent, why do they not do it?—It is a difficult matter to get out of an old habit, even if it is a bad one.

4620. Do you not think that a man's pocket very soon brings him to the knowledge of whether a habit is prejudicial or otherwise to his own interests?—If a man's pocket does not suffer very much, it very often happens that the habit is stronger than the pocket.

4621. Then your opinion is, that the reason why they do not send it dead from the Continent is, that they have got into some bad habit of sending it alive?—I do not say that the habit of sending it alive is necessarily a bad one, but I say that the habit of sending it dead would be better.

4622. Surely it is a bad habit to send it alive, if they can send it dead cheaper?—Yes, it is in that sense, no doubt.

4623. And therefore, according to you, we may put it down as being simply a prejudice or a bad habit of theirs?—An old-fashioned habit.

4624. Have you heard the evidence which we have had from the Continent upon that question?—No, I have not been here before to-day.

4625. Have you read the evidence?—I have read a little of it, but not any from the Continent.

4626. You are not aware that we have had evidence from the Continent, which goes to prove that it would be much more expensive for them to send it dead than alive?—I was not aware that you had had that evidence.

4627. You stated that one of the conditions which

Mr. *Sheldon.*

13 June 1877.

Mr. *Sheldon.*

13 June 1877.

Mr. *Ritchie*—continued.

which would enable them to send meat from the Continent cheaper dead than alive was, you imagine, that the freight was less?—Yes, decidedly.

4628. But you acknowledge that other elements enter into the question besides freight?—Yes.

4629. Ice is very necessary, I suppose?—Yes.

4630. Are you aware that in some years there is great difficulty in obtaining ice, say in Denmark?—Yes, I am.

4631. And of course if they had to go to considerable expense to obtain ice, it would add materially to the cost of sending dead meat here?—Yes; but shortly they will be able to get ice by artificial means, I hope at a sufficiently low rate, or to adopt some other process which will obviate the necessity of ice.

4632. Assuming that this difficulty in obtaining ice at low prices exists, that would materially increase the cost of sending dead meat there, would it not?—Yes; it would of course.

4633. Again, is not the offal a very important element in the question; if they had not a good market for offal over there, would not that materially increase the cost to the exporter of the dead meat?—Why could he not send the offal as well if he wanted to?

4634. Do you not think that a considerable portion of the offal would be difficult to bring and sell in good condition here?—Not more difficult than the meat itself, I think. I do not see why it should be.

4635. Did you hear the evidence which we had given by the last witness, in which he stated, although he spoke very highly of the American imported meat, that notwithstanding that it was very good, people would pay more for fresh meat?—Ah, there is the old habit you see.

4636. Some people may think that it is a very good old habit?—Of course they think it is a good one; they think everything good that they like, whether it is good or bad.

4637. If it be true as a matter of fact that the consumer is willing to give, say 1 *d.* a lb. more for fresh meat than for imported dead meat, of course that has to be taken ultimately out of the pockets of the exporters, I suppose?—I do not know; they would divide it perhaps.

4638. If a man were exporting meat it would be a matter of great consideration to him, of course, to know what price the meat would realise in the market to which he exported it?—Yes; undoubtedly that would be one of his chief considerations.

4639. And therefore, if experience showed him that he could only obtain 1 *d.* per lb, less for it at the market to which he sent it in a dead state, the loss of that 1 *d.* would be one of the additional expenses which he would incur in sending it dead?—If he thought that many people would be foolish enough to pay a fictitious price for home-killed meat, it would not alter the matter at all.

4640. Surely, if an animal brings in 1 *d.* per lb. more alive than it would bring if it were dead (it does not matter for what reason, whether it was fictitious, or whether it was a prejudice, or whatever it was), that would add very materially, would it not, to his expense in sending the meat over dead?—Yes, of course it would add that much to it.

4641. And whereas it might be a paying trade for him to send the animals alive, it might, under the circumstances that I have stated, be a losing trade for him if he sent them dead?—Yes; but in this case I think that we are conjuring up a phantom, and then getting frightened at it.

4642. That is a matter of opinion, but I put it to you as a matter of fact. Supposing it to be a fact that the dead meat is not worth so much as the live meat, that is so much against a man sending it dead?—Of course it is.

4643. If that be the case, it might pay him to send it alive, and it might not pay him to send it dead?—It might, or it might not.

4644. And you will acknowledge that is, after all, a question of paying or not paying, as to whether we shall obtain large importations?—Yes; but with regard to the exporters, it is a pure matter of pounds, shillings, and pence; I do not believe that they have any feeling of philanthropy about the matter at all.

Mr. *Murphy.*

4645. I think you stated that you made inquiries some time since as to the importation into Ireland of pleuro-pneumonia by means of Dutch cattle?—I did.

4646. How long is it since you made those inquiries?—Some two years. I was writing an article upon the subject.

4647. I take it for granted that you have notes of these inquiries, and of the results of the inquiries?—I am not sure that I have any notes, but I have the authorities and the article itself.

4648. You could produce them, of course?—I could.

4649. Do you recollect in what part of the country that importation took place?—So far as my memory carries me, the cattle were landed at Cork.

4650. Did you pursue your inquiry as to what the consequences of that importation were?—Not specially so.

4651. Did the result of your inquiry inform you that these cattle had pleuro-pneumonia when they were imported?—No, they had it when they landed or shortly after; at all events they brought it.

4652. The result of your inquiry was that they brought it?—That was the result of my inquiry.

4653. You did not inquire how long they were in the country before the symptoms showed themselves?—I am not sure whether I did or not.

4654. Then you cannot tell whether or not they imported pleuro-pneumonia; that is to say, whether they had it when they landed, or whether the lung disease which broke out amongst them was in consequence of the change of climate and the change of treatment which those cattle experienced in Ireland from what they had in their own country?—I do not know to what cause it was owing, but one is about the same as the other in gravity.

4655. Did you inquire how long it lasted, or whether it spread?—I forget now how far it spread then, but we have never been entirely free from it since; with very few exceptions, at all events. It has broken out occasionally ever since in differents parts of the country.

4656. In England?—In England and in Ireland.

4657. I am talking of the locality itself, Cork, where

Mr. *Murphy*—continued.

where you say it was landed; can you trace any affinity between the landing of cattle in Cork and the breaking out of the disease in this country and in other parts of Ireland?—I have not done so.

4658. You cannot give us any specific information upon the fact, further than that you heard that certain cattle were landed at Cork, and that pleuro-pneumonia broke out amongst them?—Yes; and that certain authorities whom I consulted at that time concurred in the opinion which I have stated.

4659. And you can produce those authorities, if necessary?—I can.

Mr. *French.*

4660. In giving the quantities of iced meat imported from America, there was a great falling off in January of this year; how do you account for that falling off?—I do not know; it is one of those curious fluctuations in commerce that you cannot account for; I think there was no special reason beyond the fact that there was a fluctuation in the market.

4661. Has foot-and-mouth disease, or anything of that kind ever been known in America at all?—I believe not; I am not aware of its ever having been known in America.

4662. You have suffered yourself from foot-and-mouth disease, amongst your cattle?—Yes, I have.

4663. Do you think that restrictions on the movement of cattle would be sufficient to stop the spread of that disease?—Yes; I believe they do stop it in the neighbourhoods where they are in force, to a great extent, at all events; they may not utterly stop it, but they have a great effect in stopping it.

4664. Have you always been able to trace the origin of foot-and-mouth disease amongst your own stock when you have got it?—No; I have not been sure that I have traced it correctly; on the last occasion that I had it I was not sure where it came from.

4665. Have you ever heard that hares and rabbits, and other animals, suffer from foot-and-mouth disease?—I am not aware of it; it is not generally accepted in my neighbourhood that they do.

4666. Have you never heard that hares get it and bring it about from one farm to another?—I have heard of their carrying the virus upon their feet, but not that they suffered from it.

4667. Do you think it possible that a hare may carry the virus from one farm to another, and thus spread the disease?—I think it is possible, but I should not like to give any decided opinion upon the subject.

4668. Supposing that to be possible, then any restriction upon the movement of cattle would not be sufficient to prevent the disease spreading to other farms?—No; but in a case like that I should restrict the movement of the hares also.

4669. How would you manage that?—I think I could manage it. The cattle are more important than the hares, I hope.

4670. It might be carried by any animal, such as dogs, or anything of that sort?—I should equally restrict the movement of dogs, I think.

4671. Then you would not allow dogs or animals of any kind to be moved about in the neighbourhood where foot-and-mouth disease

Mr. *French*—continued.

existed?—Any dogs would come on my premises at their peril.

4672. Would you propose that the restrictions should be so severe as to prevent the movement of any animals whatever?—It is difficult to say what one would do, but one would use every possible precaution against the spread of the disease; the disease itself is of far more importance to us than the precautions which we should have to take to prevent it.

4673. Do you think that it is indigenous to the country now?—I am rather inclined to think that it is; I hope not.

4674. You think it might be liable to break out again, even after we have succeeded in stamping it out?—But if we stamped it out two or three times in succession in that way, possibly it might lose its indigenous character if it has it.

Mr. *Cameron of Lochiel.*

4675. At present the people on the continent have the power of sending the cattle either dead or alive, whichever they like, of course?—Yes.

4676. And they prefer sending it alive?—They prefer it, because they are accustomed to it.

4677. I suppose that if you prohibited them from sending it alive they would then have the option of either sending it dead or of not sending it at all?—Yes.

4678. Do you think it possible that any difficulties which they at present foresee in the way of sending dead meat might in that case be overcome?—Yes, I quite believe, with the evidence of the American meat trade before us, that this difficulty would be overcome with regard to the continent.

4679. I suppose that you, as a farmer, do not much care whether they send their meat dead or alive; all you wish is, that you may not get the disease through their sending the cattle into this country?—I do not care how much cattle they send us if they send us no disease.

Mr. *Arthur Peel.*

4680. If there was no cattle plague in a foreign country would you not think that the provisions of slaughtering animals at the port at which they arrive would be a sufficient protection against pleuro-pneumonia and foot-and-mouth disease?—I do not know what to think about it; I daresay that it would be a more sufficient protection against pleuro-pneumonia and against foot-and-mouth disease than against cattle plague.

4681. I should like to have your opinion upon that point, if you are able to give one, because I understood you in an earlier portion of your evidence to say that you were for the total prohibition of the live-meat trade?—I do not think that it would be sufficiently safe to do it, for the men who kill the animals are so careless, as a rule; they run about the country without having taken sufficient precautions to disinfect themselves.

4682. You do not think that precautions might be taken to insure that these two diseases (I am not speaking of cattle plague) might not be spread?—Perhaps they might, but it would not be worth while to be at the trouble of taking all those precautions, instead of simply conveying the dead meat over the sea.

4683. But if the dead-meat trade was not

Mr. *Sheldon.*

13 June 1877.

Mr. *Sheldon.*

13 June 1877.

Mr. *Arthur Peel*—continued.

established I suppose you would hold very different views from what you have already stated to the Committee; you have expressed an opinion that the trade in live animals should be totally prohibited; but I suppose you have come more readily to that view in consequence of what you regard as the establishment of the dead-meat trade?—Yes, decidedly.

4684. If the dead-meat trade was proved to you not to be likely to establish itself you would not speak so positively about the prohibition of foreign cattle?—No I should not speak quite so positively at all events, because I should wonder where the supply was to come from but for that.

Mr. *Arthur Peel*—continued.

Major *Allen.*

4685. Are you aware whether they have refrigerators on the railways in America, and whether they bring all their meat from the west up to New York?—I believe that New York is principally supplied from the surrounding district.

Friday, 15*th June* 1877.

MEMBERS PRESENT:

Major Allen.
Mr. Anderson.
Mr. Assheton.
Mr. Jacob Bright.
Mr. Cameron of Lochiel.
Mr. Chamberlain.
Mr. James Corry.
Mr. Dease.
Mr. Wilbraham Egerton.
Mr. Elliot.
Mr. W. E. Forster.
Mr. French.
Sir George Jenkinson.
Mr. King Harman.
Colonel Kingscote.
Mr. M'Lagan.
Mr. Murphy.
Sir Rainald Knightley.
Mr. Norwood.
Mr. Arthur Peel.
Sir Henry Selwin Ibbetson.
Mr. Torr.

SIR HENRY SELWIN IBBETSON, IN THE CHAIR.

Mr. JACOB WILSON, called in; and Examined.

Chairman.

4686. I BELIEVE you live at Woodhorn Manor, Morpeth, Northumberland?—I do.

4687. And you are a tenant farmer in that county?—I am.

4688. Have you had the management, also, of several estates in that county?—I have.

4689. And I believe you are also the Secretary to the Northumberland Agricultural Society?—I am.

4690. Are you a member of the Council of the Royal Agricultural Society of England?—I am.

4691. And they have, I believe, deputed you to give evidence before this Committee as representing their opinions?—They have.

4692. The Committee are aware, I believe, that the Royal Agricultural Society passed a resolution some time before this Committee was appointed, which resolution was forwarded to the Privy Council, and which was the motive power that set this inquiry in motion?—They did.

4693. Have you before you the terms of that resolution?—I was the mover of it myself. It was to this effect: "That seeing that the precautions hitherto adopted for preventing the outbreaks of rinderpest and other contagious diseases of animals in Great Britain have not been successful, it is the opinion of this council that nothing short of the total prohibition of the importation of live stock from European ports will meet the exigencies of the case;" and following upon that was another motion: "That uniform and compulsory measures be enforced throughout the kingdom for the suppression of contagious diseases of cattle generally." Was that resolution passed on the first outbreak of cattle plague this year, imported by the "Castor." It was passed in the first week in March.

4694-5. That was subsequently to the cattle plague being brought into the country?—It was.

Chairman—continued.

4696. Did the Royal Agricultural Society take any further steps as the disease spread in London?—Yes; on the further outbreak at Willesden, the council of the Royal Agricultural Society considered it to be their duty to represent to the Privy Council their opinion to the effect that the authority hitherto exercised by the local authorities in Middlesex and the Home Counties, ought to be superseded by the Privy Council itself.

4697. That was in consequence of the disease spreading in the way it did in the metropolitan district?—Yes, especially the outbreaks at Willesden, when it got so far.

4698. That was from a fear on the part of the Royal Agricultural Society that, spreading rapidly as it was, it was getting very near the country districts?—Yes, and getting beyond the limits and control of the Metropolitan Police District.

4699. Was that from a fear that the local authorities might not have sufficient means at their disposal to cope with the rapid spread of the disease?—Not necessarily that they had not the power, but that they did not exercise it in a manner which seemed satisfactory.

4700. It was from the fear that, although the power existed, the local authorities were not sufficiently alarmed by the nature of the disease?—Yes, that was our impression.

4701. Looking at the resolution, which you state was moved by yourself and unanimously adopted by the council, I see that it recommends total prohibition of the importation of live stock from European ports; would you give the Committee the reasons, if you are aware of them, which led the Royal Agricultural Society to adopt so strong a resolution as total prohibition?—The reasons were, simply, that notwithstanding inspection and slaughter at the ports of debarkation, those precautions had not been sufficient to prevent the spread of cattle plague, and other

Mr. *Wilson*.

15 June 1877.

Chairman—continued.

infectious diseases, in this country; and if I might be permitted to say further, I would draw the attention of the Committee to the return moved for by the honourable Member for Northallerton, which showed that, during the past three years, out of 12,380 cargoes landed, one was affected with cattle plague, 13 with pleuro-pneumonia, and 1,381 with foot-and-mouth disease. When you consider that those cargoes were the only ones detected, and that exporters are as much alive to detection as we are, it is quite possible that a certain number of diseased animals may have been kept back from cargoes or thrown overboard, and animals landed in this country in which disease could not possibly be detected. We are corroborated in that opinion by the very important evidence which was given by Professor Müller the other day, who showed that, notwithstanding the restrictive measures adopted and about to be adopted by the German Government upon the frontier of Russia, from which country, no doubt, they receive cattle plague, they will still be liable to cattle being smuggled into the country, and so escape detection; and, as they cannot detect the disease under at least three days, it is very possible that that would give time enough to allow the cattle to run through the length and breadth of Germany.

4702. But I understand you to say that this resolution was passed at a time when the council would not be aware of any fresh restrictions being contemplated by Germany?—That was so.

4703. And therefore that resolution was passed on the existing German regulations?—Yes.

4704. In consequence of the difficulty, as it appeared to the council, of detecting the introduction of cattle plague into Germany, they passed a resolution recommending that, so long as that was the case, the total importation should be stopped, as our security was so slight?—It was partly that, and also from the practical proof that, with all the precautions and inspection, cattle plague had got into the country.

4705. Are you aware of what were stated to be the proposals as to fresh restrictions likely to be adopted by the German Government?—Yes; I heard that.

4706. I think Professor Müller, who was corroborated by the Baron von Behr, stated that they proposed not only to maintain their zone, as they describe it, over which cattle would have to be driven, rendering their being smuggled across much more difficult, but that the transit of cattle should be limited to places 50 miles distant, as the Baron described it (there was some discrepancy as to the distance, but he put it down at 50 miles) from the frontier line; you are aware that that was one of the proposals?—Yes.

4707. Another proposal was, that on the first sign of an outbreak of cattle plague crossing this zone, all markets for exportation should be absolutely stopped?—Yes.

4708. And that the telegraphic communication should be made more direct instead of round about, as it is now, through a central authority?—Yes.

4709. Do you think that, if those three additional regulations had been in force, the Council of the Royal Agricultural Society would still have passed a resolution declaring the necessity of total prohibition?—I do, for this simple reason: that on cross-examination Professor Müller distinctly said that even with these increased restrictions they would still be liable to smuggling; and also, I may say, that at present it is quite clear that they have full powers and authority, and instructions to telegraph upon the least outbreak, which instructions do not seem to have been carried out upon the last outbreak in January.

4710. But that was exactly the amendment which seems to be proposed in the telegraphic arrangement by the German Government; they admit that it is faulty at present, and that we got the cattle plague partly in consequence of that mistake; but they say that they propose to correct that in future, and that instead of its being possible that delay should arise from the telegraphic message going to the central authority on a Sunday, as in this case, and not getting to us till nearly two days after the notice was given, in future the veterinary surgeon who discovers the disease at the port itself shall telegraph direct to the English Privy Council, instead of through his official superior; would not that meet the difficulty?—Yes; but since the telegraphic service is so expeditious, I cannot see any reason why two days should have elapsed without our knowing, however roundabout it had been, even if it had gone round the world.

4711. That was why I mentioned the word Sunday; it was because the office was shut on the Sunday that they represent that the delay arose?—Yes; but still it was two days before the knowledge of it reached us.

4712. I want the Committee distinctly to understand what you feel with regard to the new proposal?—I feel that it would minimise the danger.

4713. They propose now that there should be no possibility of delay in not receiving the news, but that the man who discovers it should at once himself telegraph direct to this country?—I have no doubt that Germany will do all that is in her power, but I feel that she is helpless; and I am corroborated by the evidence of Professor Müller, who said that, with all the restrictions which they may impose, they may still be liable to the introduction of the disease by smuggling.

4714. You do not think that that being the case, our protection would be sufficient from the fact of her closing her markets on discovery of the disease, and preventing export to this country, and telegraphing straight to us of the outbreak?—No, I do not think that we should be entirely safe.

4715. I understand you to express that opinion in consequence of the danger of the introduction of cattle plague?—Yes.

4716. Have you considered the question of pleuro-pneumonia and foot-and-mouth disease?—I have.

4717. Does that or does it not strengthen your view of the necessity of stopping the import?—I think that pleuro-pneumonia is more alarming still, inasmuch as it takes much longer to develop.

4718. Even supposing that you could be satisfied with regard to the cattle-plague, the pleuro-pneumonia danger would still more lead you, and you think would lead the Royal Agricultural Society to urge the total prohibition of the importation of live animals?—I think that in a very great measure it would.

4719. In view of the possibility of its being either

Chairman—continued.

either from reasons of political economy, or from other reasons, thought to be unwise to adopt such a suggestion as that of absolutely stopping the import of foreign cattle, have you at all thought of, or has the Royal Agricultural Society at all considered, any alternative scheme to that?—Individually I have, in conjunction with some of my friends, although I am not prepared to say that the matter has come before the council.

4720. You yourself, I understand, have thought out a possible alternative?—I have.

4721. Always retaining the other as your first recommendation?—Total prohibition being my standpoint.

4722. Under the circumstances of your being driven to another expression of opinion, would you tell the Committee what you would suggest?—I would suggest the total prohibition of cattle from all countries in which disease is known to exist, or from any country which permits the introduction and transit of animals from such diseased countries. The only relaxation or exception would be in favour of those countries which are themselves free from disease, and do not admit cattle from countries in which disease exists. These cattle should be slaughtered at the port of debarkation.

4723. Do I correctly understand you to say that, taking such a country as Denmark, which, I believe, can show a tolerably clean bill of health, you would, as your alternative, think that her cattle might be admitted into this country, provided they were slaughtered at the port of landing?—Yes.

4724. And you would consider that the cattle might be so treated from any country which could give sufficient guarantees to this country that it did not import or was not likely to import these diseases?—Yes; I should put the *onus probandi* upon the exporting country, and in the event of any disease occurring, they must then, of course, come under the total prohibition.

4725. I understand you to express it as your opinion, as an alternative to total prohibition, that all countries should be scheduled, and that some of the scheduled countries should be absolutely prohibited, on any outbreak either arising in the country or upon its being shown that they have relaxed their restrictions and have, therefore, become liable to the importation of disease?—Quite so.

4726. Would you make those regulations identical both with regard to cattle and sheep?—No; not necessarily with regard to sheep, I think. But that is a matter which comes more within the scope of the scientific witnesses. They show, I think, that sheep do not bring disease so readily as cattle. It would depend very much whether those sheep were in contact with diseased animals or not on board ship, or from a country where disease exists.

4727. Then you do not think that it would be absolutely necessary to have the same amount of restrictions with regard to the importation of sheep as with regard to the importation of cattle; would you oblige all sheep to be slaughtered at the port, or would you allow their free circulation when they came from the scheduled countries, and not from the prohibited countries?—I should not see the same danger in them as in cattle, and should not object to their removal to certain large towns for the purpose of immediate slaughter.

Chairman—continued.

4728. I suppose you would admit that a large part of our different centres of population are very much dependent upon the supply of foreign sheep?—Clearly.

4729. Therefore, inasmuch as it has been shown by scientific evidence that the danger of importing disease by sheep is nothing like that of importing it by cattle, I presume that you would be of opinion that it would not be wise to restrict the import of live sheep into this country?—I should not make it so strong a point, certainly.

4730. And while you would suggest the regulations which you have described as your alternative proposal for dealing with cattle, you think that they may be even further relaxed in dealing with sheep from foreign parts?—Yes; subject, of course, to every possible restriction, such as inspection.

4731. Subject, I suppose, to the restrictions at present existing, that if any sign of disease showed itself, the whole cargo should be slaughtered?—Clearly.

4732. You would not relax any of those conditions?—Certainly not.

4733. That is your alternative scheme; but in reference to your original scheme forbidding all import from abroad, had the Council considered the question of sheep, and were they included in that resolution?—I think the resolution applied more to cattle than to sheep, although the same danger appeared; but it was always with a view, which I strongly wish to bring before the Committee, that the future supply of this country, both internal and external, points to a dead-meat trade.

4734. And you believe that if these restrictions which you have suggested were adopted, the supply of the country would continue in the form of a dead-meat supply, instead of coming in the shape of live stock as at present?—Certainly; that would be more than an equivalent.

4735. You think that the prices that would be maintained in this country would attract a dead-meat supply?—I do.

4736. Can you give the Committee the loss which you consider the country suffered at the time of the outbreak of cattle plague in 1865 from the disease being imported?—Professor Browne is perhaps the best authority on that subject, and if it be correct, as he has stated, that it was a direct loss to this country of 5,000,000 *l.*, I venture to assert that the indirect loss was quite double that amount.

4737. By indirect loss I suppose you mean the loss to the country from the stopping of breeding and the dread of the disease which prevented men dealing in cattle as they had formerly done?—I do. It would be very difficult to compute the exact amount, but I am quite sure that I am within the mark.

4738. You think that there was a very large indirect loss beyond the direct loss suffered by the death of animals?—No doubt, and I do not hesitate to say that this country has never recovered the supply of animals lost by the disease.

4739. You mean that a fear of that disease still exists, and has prevented the re-establishment of that breeding of cattle which before went on?—That would be so, but I mean that there were more cattle in the country before

Mr. *Wilson*.

15 June 1877.

Chairman—continued.

the outbreak of 1865, than there are at this moment.

4740. Have you any figures that would show that?—I believe that figures can be produced, and I expected to have had them this morning; but, in round numbers, I believe it may be taken that the home stock in this country previously to 1865, would be equal to something like seven millions; it is at least a million less at the present moment.

4741. Is that founded upon the agricultural statistics? — Yes, I believe that that Paper will be put in through the Government authorities.

4742. Have you any information which you could submit to the Committee with regard to what the price of meat at that time was, and whether it has continued at the same rate, or has risen, or otherwise?—There is no doubt that the price of meat at this moment is about 1⅜ *d.* dearer than it was in the two years previously to 1865. In 1863, the mean price of beef at Leadenhall and Newgate was 5¼ *d.*; in 1864, it was 5¼ *d.*; in 1865, the year when the disease broke out, it was 5¾ *d.*; in 1866, it was 5⅞ *d.*; in 1867, it was 5¾ *d.*; in 1868, it was 5⅝ *d.*; in 1869, it was 6⅛ *d.*; in 1870, it was 5⅝ *d.*; in 1871, it was 6½ *d.*; in 1872, it was 6⅜ *d.*; in 1873, it was 7⅜ *d.*; in 1874, it was 6½ *d.*; in 1875, it was 6¾ *d.*; and, in 1876, it was 6⅜ *d.*; and mutton, I take in proportion.

4743. May I ask where those figures are taken from?—From the Statistical Department.

4744. So that those figures are a certified authentic statement of the prices that have ruled during those years?—They are.

4745. And they show that the price has risen considerably since the outbreak in 1865?—They show that beef has never been at the same price as it was in the two years previous to the outbreak in 1865.

4746. You would give as one of the reasons for that fact, that the home supply of meat has diminished in consequence of that outbreak, and of the fear engendered by it?—I do. It never recovered the standard of 1864, not only from the great loss by cattle plague at that time, but also from the three or four outbreaks of foot-and-mouth disease and cattle plague subsequently. I may point further to the fact that when there was an outbreak of cattle plague in 1872, beef was then 6⅜ *d.*

4747. That was the outbreak at Hull, was it not?—That was the outbreak at Hull. In 1873, the year following, it was 7⅜ *d.* But that was not due only to cattle plague, for in 1869, 1871, and 1872 I believe that the outbreak of foot-and-mouth disease was more severe in this country than it ever was before. Professor Simonds says that it was worse in 1842; I do not remember that.

4748. Have you had brought to your notice the statement that has been made by one or two witnesses, that in consequence of the cattle restrictions of 1865–6, foot-and-mouth disease and pleuro-pneumonia were practically stamped out?—We were never so free from disease as during the existence of the cattle plague restrictions of 1865 and 1866.

4749. Do you attribute the outbreak in 1869 to the removal of those restrictions?—I think we have a right to presume so. Following up my statement in 1869, 1871, and 1872, during which years the worst outbreak in my recollection occurred, I believe that we have statistical authority for stating that there were over 500,000 cattle reported to have been attacked; and it was so bad then, and the Government of that day became so frightened that they have never issued any further returns.

Chairman—continued.

4750. You say that the Government of that time were so frightened?—I have a right to presume so; I cannot imagine any other motive.

4751. Were any fresh orders issued by the Government at that time, or were any attempts made by the Government to deal with the outbreak?—Yes, the Act of 1869 was passed, which gave powers to local authorities to deal with the question.

4752. That was the date, was it not, when the Act was passed enabling local authorities to deal very strictly with those diseases?—Yes.

4753. And those powers have since been put in force by the local authorities?—By some of them; it is optional.

4754. But you think that the sign of their dread is their having ceased to make the returns of the losses?—I cannot ascribe it to any other motive; we cannot get at them.

4755. You say that power was given to the local authorities, and that that power was very unequally used?—It was.

4756. Do you wish the Committee to infer that you think that powers of that sort should be taken away from the local authorities, and given to a central authority, in order to make them uniform?—Most decidedly. I may give you an illustration of that. I speak for my own county, the county of Northumberland, in which is the borough of Newcastle-upon-Tyne, having a very large market, where 2,000 live cattle are sold every week. Immediately adjoining, within you may say a stone's throw, only separated by the River Tyne, is the county of Durham, in which there is another local authority. At Newcastle, therefore, three local authorities converge. The local authorities of Northumberland prohibited all live animals coming out of Newcastle market into that country; the local authorities of Durham permitted live animals to go into the county of Durham; so that the simple action of the butchers was to buy their cattle in Newcastle market, to take them across into Durham, and then to come back over the bridge into Northumberland, without going through Newcastle market again. I think that that is as strong an illustration as I can give you of the want of uniformity of action.

4757. You mentioned three authorities; the third was the county of Northumberland, I suppose? — The county of Northumberland, the borough of Newcastle, and the county of Durham.

4758. Have the county of Northumberland different regulations from the borough of Newcastle?—Yes; they were all on three distinct principles. I am not prepared to tell you who the actual authorities were in each case; but you will find that is so constantly throughout the country; and it opens the door to a great deal of fraud. Cattle were permitted to come into Northumberland as store cattle, but not as fat cattle; the consequence was, that if a butcher from Northumberland went into the county of Durham to buy fat beasts, he got a store-stock certificate to bring them back again.

4759. In fact, you represent that a better illustration

Chairman—continued.

illustration could not be given of the utter uselessness of continuing those powers in local authorities?—That is my point.

4760. And that, where those diseases have to be dealt with, they ought to be dealt with uniformly by some central authority?—Most distinctly so.

4761. Do you believe that the local authorities throughout the country would be prepared to submit to the appointment of inspectors by a central authority?—I should think that a great many of them would be very glad to be relieved of it.

4762. I could understand their being very glad to be relieved of it, if that implied that they were relieved of the payment; but supposing that the county had to pay inspectors, but that their appointments had to be made or certified by the central authority, do you think that there would be any resistance by the localities?—Certainly not by the ratepayers.

4763. The object that would be attained is so clear, and the results would be so advantageous, that you think they would submit to the additional exercise of the central authority?—I think so, most distinctly.

4764. You stated to the Committee just now what you considered to be proper precautions for protecting us in future against diseases of animals from abroad; that is, dealing with cattle plague, pleuro-pneumonia, and foot-and-mouth disease; have you thought, with regard to these diseases, what our home precautions ought to be, in addition to the centralisation of authority in the Privy Council, which I understand you to recommend?—Before answering that question definitely, I should like to be told what the Government intended to do with regard to the importation of cattle; because, unless certain restrictions were placed upon the importation of disease into this country, it would be utterly useless and futile to attempt internal precautions.

4765. I understood you to have submitted to the Committee two propositions: one a total prohibition of import, with certain relaxations as regards sheep; and the other a permission to schedule certain countries where no disease exists, and to slaughter their cattle at the port of landing, but prohibiting import from any country that could not give us fair security, and allowing sheep from those countries that were scheduled to circulate?—Under proper restrictions.

4766. You said that you must first know what was to be done abroad; supposing that your first suggestion were adopted, viz., absolute prohibition of import of cattle, with relaxations as to sheep, what would be your home precautions?—I consider that the country would be perfectly satisfied to adopt the system which was suggested by Professor Brown, in answer to Questions 309 and 310 of his examination-in-chief.

4767. That is, to absolutely forbid the movement of cattle in this country, and to shut up fairs and markets until you can stamp out disease?—I do not think that that was quite universal.

4768. The right honourable gentleman the Member for Bradford, in cross-examining Professor Brown, I think elicited that view?—Yes, but I particularly referred to Questions 309 and 310.

4769. Professor Brown is asked this question:

Chairman—continued.

"What measures would you suggest to prevent the introduction of this disease?" and his answer is: "I should make certain alterations in the present system of dealing with these diseases, or I should make a radical change, abandoning the present system altogether, and adopting an entirely new one in its place." Then he is asked: "What would that be?" to which he replies: "First of all, having regard to the existence of these two diseases in this country, I should feel bound to impose very severe restrictions upon the cattle plague. Both in reference to foot-and-mouth disease and pleuro-pneumonia; there can, I think, be no question whatever that the infective matter is chiefly conveyed through the movement of diseased and infected animals. Therefore I should be obliged to adopt such a system as would entirely prevent this movement. In order to do that, I should be compelled to divide the whole country into districts, placing each one in charge of an inspector, who would be in constant communication with the central department. Having found all the centres where either disease exists in the district, it would be absolutely essential to prevent the movement of animals from those centres during the continuance of the disease." Then you contemplate in your answer to Professor Brown's suggestion to divide England into districts, and simply to stop the movement of animals in such districts as have either of those diseases within their boundary at the particular moment?—Yes.

4770. Are you aware how many counties there are in which pleuro-pneumonia and foot-and-mouth disease exist at the present moment?—I have heard that there are 33; but I may be permitted to qualify that by suggesting that it is very possible that they exist very much in town dairies in those counties.

4771. You believe that the areas of infection may be very much smaller than the counties themselves?—I do.

4772. And you think that the country would be prepared to submit to the absolute stoppage of movement, and to the closing of fairs and markets, when the country was so divided into districts, in any district in which disease could be shown to exist?—I do; for this simple reason, that the more restrictive you are the shorter time is required. I assume that the animals may move under license within the cordon of the district itself, and I assume also that the Privy Council would have discretionary power probably to apply the same restrictions to the zone around the infected zone, if necessary, because the disease might be on the very edge of the zone.

4773. Wherever it could be shown that disease existed, you would give the power not only to regulate the movement within that zone or district, but, if it was necessary, to do it in any adjacent district?—Yes, on condition that it is all under the Privy Council. I wish it to be particularly understood that I think it is highly probable that the farmers of England would not submit for any length of time to very strong restrictions, if they were similar to the present restrictions, which were always exceedingly harassing, seldom satisfactory, and certainly not always effective.

4774. And your principal reason for saying that is their want of uniformity?—Certainly.

4775. Under those circumstances, the country being so divided, do you agree with Professor

Mr. *Wilson*.

15 June 1877.

Chairman—continued.

Brown in what he stated as to the time which he thought it would take to stamp out the disease, viz., six years?—That is quite problematical; I cannot see why it should take so long.

4776. Do you think that the country would submit for six years to such restrictions with an object like that in view?—You must bear in mind that it does not follow that these restrictions would be in existence for six years in any one particular district; and I am strengthened in that idea by the evidence which has been given from both Denmark and Schleswig-Holstein, where it has been shown to be quite possible to stamp out foot-and-mouth disease.

4777. Doubt has been thrown upon that being a sufficient test, from the fact of the disease having been spread to such a limited extent; it has been stated that it was only in the case of a few farms in Schleswig, and on two separate farms on two distinct occasions in Denmark, that the experiment has been tried and has succeeded; but you think that it would equally apply to a country where the disease has become so naturalised as it is supposed to be in this country?—You would naturally suppose that it would; at any rate it would reduce it to a minimum.

4778. And you see no reason why, it having been successful in the small outbreaks, it should not be successful where the disease prevailed to a much larger extent?—No; it might require a little longer time, that is all.

4779. And you think that the farmers of the country would be quite willing, with the object in view, to submit to the restrictions for a lengthened period?—Yes; they would submit for any length of time, whenever it is necessary, so long as they have the satisfaction of knowing that the Government of the country is doing all that it can to keep the disease out of the country; but, without that security, I do not think that they would submit to any such restrictions.

4780. Would you suggest those home regulations with your alternative scheme, as well as with your first scheme?—Yes.

4781. In case either of those alternatives were adopted, you think that the home trade would submit to those regulations?—I do.

4782. I suppose you would imply that Ireland ought to be treated as a part of the United Kingdom with regard to this matter?—Most certainly; I look upon Ireland as part of England entirely.

4783. And therefore you think that the same system that was adopted in England should be applied to Ireland?—I do, because I believe there is no more disease in Ireland than there is in England in its natural condition.

4784. And the same conditions as to import from abroad and restrictions at home, you think, should apply generally throughout the United Kingdom?—I do.

4785. Have you yourself, as a tenant-farmer, had personal experience of pleuro-pneumonia and foot-and-mouth disease?—I am sorry to say that I have.

4786. Both in cattle and in sheep?—Both in cattle and in sheep; foot-and-mouth disease only in sheep.

4787. But you have had experience of those diseases on your farm?—I have.

4788. To any extent?—During my father's lifetime I very well remember his having lost,

Chairman—continued.

practically, two herds of shorthorns by pleuro-pneumonia, one of them in the outbreak in 1840 (I forget when it was exactly), and the other about 1852, I think.

4789. Would the first of those have been before the importation of foreign stock?—I do not say that it was before the importation of foreign stock, but it was probably before 1845. I cannot quite remember the date, but I do remember the 1852 outbreak; and I also remember the year before last, when I myself suffered considerably.

4790. Were both those earlier outbreaks outbreaks of pleuro-pneumonia?—Yes.

4791. Your own recent experience has been also of pleuro-pneumonia?—Yes.

4792. Was that imported from abroad, or can you give the Committee any idea of how it came to your herd?—I should like to have begun at foot-and-mouth disease, for the purpose of showing the Committee that those animals which were taken first with pleuro-pneumonia were the animals which suffered most in a previous attack of foot-and-mouth disease, by which their health had been much impaired.

4793. Your cattle had the foot-and-mouth disease first?—Yes. I sent an order to a very large dealer in Westmoreland, where I buy most of my cattle, and as much as possible from private farms, instead of at fairs. I never buy cattle in a fair, if I can avoid it. One of the conditions which I imposed upon him was, that the cattle that he had to send me should be bought direct from a healthy farm, and should not have been in a fair. Unfortunately, he had a large quantity of cattle at a fair which he could not sell, and he sent them to me without my knowing that they had been there, but telling me that they were bought well worth the money. I traced this afterwards. A very few days after their arrival foot-and-mouth disease broke out, and, instead of getting fat during that summer, they dragged their weary length along until the following spring, and I lost three months of my keep. Instead of my then being able to sell them, pleuro-pneumonia appeared amongst them, and especially amongst those which had been most severely handled by foot-and-mouth disease.

4794. That represents, then, to the consumers of the country a clear loss of nearly a year of the feeding properties of your farm?—Very much like it, because I only got three-fourths of the value at the finish.

4795. But, looking at it from the consumer's point of view, that strengthens your argument that these diseases reduce enormously the food of the people?—Yes; and not only so, but instead of my having two lots of cattle fed off in the time, I could only get one lot fed off.

4796. Did you suffer from foot-and-mouth disease with any of your dairy-stock?—Yes, but not at that particular moment, because I had isolated them in one large park that I have, and used every precaution to keep it away.

4797. With dairy-stock I suppose the loss is very severe?—Very severe. There is no saying where the end of it is, because not only do you sacrifice the breeding power of your valuable cows, but you lose your produce, you lose your time, and the consequence is that the country loses it stock.

Chairman—continued.

4798. Have you found that cows have dropped their calves afterwards?—Yes. In the first place, a great many of them did not breed any more, and, in the second place, if they did breed, they probably dropped their calves; and in many instances, some of the quarters or teats of the udder refused to give any milk. Then as to the sheep; in the same way I suffered very much from an outbreak of foot-and-mouth disease among my ewes just before lambing. As you have heard from other witnesses, the result of that is very serious.

4799. These risks, in your opinion, make it absolutely necessary not only for the protection of the farming interest in the country, but for the production of the food that is supplied to the people, that steps should be taken to eradicate diseases which are attended by such risks?—They do. In the face of all this disease, people dare not go into breeding, and I may say that following up the question with regard to the outbreak of 1865, we are well aware that a great many farmers have never since pursued the same system, which up to that time they had been accustomed to pursue; they dare not do it; they prefer going to a market and buying other cattle which are probably nearer the butcher, so that in case of an outbreak they are prepared to send them off on the shortest notice, the risk being less, rather than keep valuable cows and risk the loss of the cows themselves and also of their produce.

4800. Have you any figures which show at all whether the breeding stock of the country is very much reduced?—I have no direct figures to show it, but I could quote many instances of it.

4801. In many large districts where there used to be breeders of cattle they have ceased to be so?—Yes; I have done all in my power on the estates with which I am connected to recommend tenants of arable land, if possible, to resume breeding and keep themselves out of the market; because I believe that the greatest safeguard to this country would be to breed more of our own cattle, and to keep out of the markets; but the risk of breeding is so great that farmers are obliged to minimise these risks. I have, I am glad to say, in some instances been able to carry out that principle. If I might quote an instance to the Committee, a very intelligent young farmer on an estate under my management, on my suggestion, adopted my plan two years ago; he had 41 calves which he bred and bought as small milk calves; he reared them, and this spring, at the age of one year and nine months and two years old, he has sold 40 out of the 41 that he had, at an average of 21 *l.* a piece. I myself last week sold some fat cattle in Newcastle Market; one of them was a home-bred one barely two years old, and the others were three years old; those were sold at 30 *l.* a piece, and I think the two-year old was the best.

4802. That you give as an instance of the profits that can be made on a well-protected breeding farm?—I do not say that profits can be made, but at any rate that is what can be done.

4803. At all events, you represent that with the liability to disease, at present those profits are very much reduced?—Certainly.

4804. Would you suggest any alteration in the regulations which are at present in force with regard to the treatment of these diseases in the country when there is an outbreak, we will say, first, of pleuro-pneumonia?—I am very strongly of opinion that, in an outbreak of pleuro-pneumonia, the security very much depends upon the knowledge of the individual to whom the cattle belongs. I should very much like to have heard Professor Brown examined upon this question, because I believe that he would have been able to throw a good deal of light upon it. It is a subject which I have investigated a little. Only yesterday I heard the history of a large dairy in London. Professor Brown is fully aware of the circumstances of it, but from their scientific knowledge, and by the application of the thermometer, I believe they are enabled to reduce to a nicety the symptoms of pleuro-pneumonia in the very early stage; and, therefore, to get rid of the animal from the byre, before it can contaminate the rest.

4805. That raises the question upon which I should like to have your opinion, viz., as to the compensation that ought to be given; that is to say, the inducement to the holder of cattle to declare the disease to the inspector at the earliest stage?—Nothing short of paying the full value will ever give you any protection.

4806. You think that, combined with veterinary inspection under the central authority, you should have full value paid as compensation for diseased animals that are slaughtered under authority?—I do; and I have strong reasons for thinking so. In some cases in the metropolis, I know before you could get the necessary order for slaughter, 60 hours in one case, and 48 hours in another, had elapsed.

4807. What happened in that interval?—The disease progressed so that the meat was of no further use; whereas in the first instance if an order could have been given, it might have been of some use. Therefore that was a direct loss to the country.

4808. Did the delay arise from the hesitation on the part of the owner to report the outbreak?—Not at all in this particular case; but it is a question rather of local authority *versus* central authority.

4809. With regard to the question of compensation, at the present time, a certain proportion is paid for animals slaughtered under authority; I understand you to suggest that, with a view of inducing the owner to communicate, at the earliest possible stage, with the veterinary authority, who will put that district immediately under restrictions, and therefore bring about the security which you are aiming at, compensation to the full amount should always be given?—I do, because there must be a greater temptation to fraud in the case of a man only receiving three-fourths of the value than in the case where he receives the whole value.

4810. And that delay may cause the disease to spread if the man hesitates to declare it, on account of his not getting what he thinks is the proper value?—That is so.

4811. Of course there is a danger in giving full compensation that you may have animals slaughtered as diseased animals, though they may, perhaps, not be suffering from the actual disease; it has always been said that the payment of a smaller sum, and not the full value, protected the public against that imposition; if you give the full value, you are, of course, liable to that imposition; do you think that the fact of its being a Government

Mr. *Wilson.*

15 June 1877.

Chairman—continued.

a Government inspection instead of a local inspection, as it is at present, would guarantee you against it?—Assuming that Professor Brown's principle is carried out in the first instance, so that there shall be a properly qualified veterinary inspector in a district, then I should certainly require a certificate from a proper authority.

4812. You think that would guarantee you sufficiently to give full compensation?—That is my opinion.

4813. Would you extend that full compensation to all the animals slaughtered by the direction of the veterinary inspector, whether they were diseased or whether they had been in contact with diseased animals only?—I do not see that it makes the least difference to the owner whether the animal is diseased or whether it has been in contact with diseased animals, so long as he is deprived of it.

4814. I suppose you admit that the flesh of the diseased animal is unfit for any other purpose than burial, whereas those animals which have been slaughtered for the protection of the public, because they have been in contact with diseased animals, might all be available for food?—I do not admit that they are unfit for food in the early stages of pleuro-pneumonia. I believe that it will be found, as a matter of fact, that, with the exception of the lungs, all other parts are available for food.

4815. Would you approve of the carcases of all animals that were slaughtered by order of the veterinary inspector being sent to the market, provided it was at the beginning of the complaint?—Provided that the veterinary inspector thought them fit for food.

4816. And the value of those carcases would have to be deducted, of course, from the full value awarded as compensation?—Yes. I do not care whether the central authority take possession of the carcases and sell them themselves or not, so long as the owner gets the proper value.

4817. It might complicate matters with the Privy Council, might it not, if they were suddenly saddled with a large number of carcases all over the country?—Yes. It comes to the same thing in the end; but I think that the thermometer test will hereafter be very much applied and be a very great safeguard.

4818. You think, then, that the public would be properly protected, the full compensation being granted?—I do, under the certificate which I suggest.

4819. Do you think that the compensation should be, as at present, a charge upon the locality, or would you make it a charge upon the Imperial Exchequer?—I should like to see it looked upon as a large national question; I think it has a right to be considered as an Imperial payment; it seems to me most unjust that the ratepayers of the country should pay the compensation, and that the towns within those counties should contribute nothing.

4820. It is a question of local taxation?—Very much so.

4821. You would make it an Imperial question, because you say that the supply of the food of the country is really an Imperial rather than a local question?—It is.

4822. Supposing your alternative principle to be adopted, of allowing the import of the animals from scheduled countries, have you any recommendation to make with regard to the steamboats?—Yes, I consider that steamboats bringing cattle here, from whatever country they come, should be specially fitted and properly ventilated, and also that they should be licensed only to carry a certain number.

Chairman—continued.

4823. Would you allow those steamboats to carry other cargo besides the cattle, or would you separate them for that particular trade?—I think that there ought to be special boats for that purpose, and I am very much strengthened in that opinion since the outbreak at Deptford.

4824. There it was shown that the possibility of the spread of the disease arose from the fact of the ship, after having discharged its cattle, going away to other places without any restrictions?—That is so.

4825. And you believe that for the future, vessels employed in this trade ought to be devoted exclusively to it?—I think that they ought to be specially fitted up and exclusively used for that purpose.

4826. It was suggested the other day by a witness, that there would be greater possibility of securing safety if the inspector inspected the vessel before she came into the port, as the Custom House officers do; do you think that that would add to our security?—I do not think so, because the passage, from whatever country it might be, must naturally cause a very large number of those animals to be in a very fevered condition; and I think that the inspector would scarcely have a fair chance of detecting the existence of disease until they had been landed.

4827. Even where you slaughter them all at the port of debarkation, there is always the possibility of the disease developing after their landing, and whilst people are in contact with them, and thus spreading throughout the country?—No doubt.

4828. That is a risk which you think is perhaps unavoidable?—It is, perhaps, a small one. I should like to say that, to my mind, it is very important that before animals are put on board they should be allowed to get cool for a certain number of hours after coming off a railway truck.

4829. It would be one of the conditions which you would insist upon, with regard to other countries exporting cattle to us, that they should detain the cattle for a time at the port?—It would. Not only does the danger exist in the vessels themselves, but also in the lairs, both at the port of embarkation, and also at the port of debarkation.

4830. Would you support the recommendation which has been made of placing an English inspector side by side with a German inspector at a foreign port?—Certainly not.

4831. You do not think that that would give us security?—Not the least; and it would relieve the foreign country of its responsibility.

4832. It would throw upon our English inspector there, the responsibility of the cattle being healthy?—Yes.

4833. You mentioned just now that you have made yourself acquainted with town dairies; is that in London?—Yes. I must mention to the Committee that it is not a subject that I have gone into very deeply, but I have endeavoured to look into the matter with a view of seeing to what extent towns could be supplied with milk from

Chairman—continued.

from the country, so as to avoid having cows within the town itself.

4834. I suppose you agree that these dairy sheds in large towns are hot-beds of infection?—I do, indeed, I know that in the case of Newcastle, where something like a thousand cows are kept, in many cases kept in a most unhealthy condition, at a very high temperature, fed on very unnatural kinds of food, and liable to be turned out occasionally on a very much exposed common, facing the north-east, there is every possible chance of their contracting disease. Then, again, the present system of management through the local authorities is most unsatisfactory, I will give you an illustration: You may take a small byre of, say half-a-dozen cows; a man's cow is affected with pleuro-pneumonia, she is condemned and slaughtered, and he receives three-fourths of her value; he immediately goes into the market and puts a pound or two more to this money and brings another back into the very stall which the diseased cow has just left; and the disease is thus perpetuated.

4835. Do you think that there is also a danger of the disease spreading from the fact that as soon as one of the cows sickens, the cows that have been in contact with it are immediately sent into the market for sale?—I suppose to some extent, that is so. I should be very much afraid of it, although not so much so as in the case of foot-and-mouth disease and cattle plague; but pleuro-pneumonia is so insidious a disease that I should be always very much alarmed at it. I may mention that the loss which we had in 1852 was in Westmoreland; we took another farm in Northumberland, and the only cattle we took to Northumberland were two favourite shorthorn heifers; three months after we took them there pleuro-pneumonia broke out in Northumberland, a hundred miles away from our first outbreak, and no other place in the country had it. Fortunately the only cattle that died were those two heifers. That was three months after the outbreak had taken place.

4836. You mean three months after the outbreak, or three months after you supposed yourselves to be free?—Probably after we supposed ourselves to be free.

4837. So that the disease had been incubating quite three months?—Yes.

4838. Under those circumstances, do you consider it advisable, supposing that dairies are continued in towns, to make stronger regulations respecting them?—I do not think that you can ever make sufficient regulations with reference to dairies in towns. If they are permitted to remain in towns I should certainly not permit an animal to come in any more than I should permit an animal to go out when there was disease; at the present moment, an animal cannot go out of that place under the existing regulations; no animal can be removed from those premises as soon as the disease breaks out.

4839. But that does not prevent the movement as soon as the disease shows itself, and the consequent spreading of fresh centres of disease through the country?—I fancy that must be done under a certificate; but I should certainly not permit an animal to come in there until after two or three months. Two or three years ago, when I had pleuro-pneumonia, it broke out regularly once in six weeks.

4840. That implies, then, that there should be a system of inspection of those dairies under the central authority?—There ought; but I should much prefer to see the dairies removed from towns altogether.

4841. Supposing your idea of the removal of dairies from towns was carried out, have you thought at all how large towns like this could be supplied with milk?—I have, and I should recommend any member of this Committee to go and see for himself the Aylesbury Dairy, where you will see from four to five thousand gallons of milk a day brought in from 60 different farms.

4842. What distance does that milk travel?—I fancy it comes chiefly from Wiltshire and Buckinghamshire; but it is a most interesting thing to know that the success of the milk depends upon refrigeration. You can send milk any distance after it is refrigerated in the same way as you can send dead meat.

4843. The same system as we have had mentioned in evidence here, with regard to the dead-meat trade, applies to the milk trade?—It does, and it is most important, in this respect, to show how nicely it must be conducted. The refrigerating process must be applied immediately the milk comes from the cow, so as to get the animal heat out of the milk in the same way as you get the animal heat out of the beef; after which you may send it any distance you like. If you apply the refrigerating process when the milk has been allowed to cool, it has no effect whatever.

4844. Is that the system which is adopted by this company?—It is.

4845. And they send, and have sent for a very long time, this amount of milk into the London market?—It is spreading every day. I may mention that the milk is supplied from 60 farms, and each farmer is bound under a penalty to refrigerate his milk at the moment it is taken from the cow.

4846. I understand you to say that you believe it to be perfectly possible to supply large towns with milk from outside of them?—I do.

4847. And that, therefore, dairies and sheds in large towns should be forbidden?—I think so, and I support that by saying that, from the recent great International Exhibition of dairy produce at Hamburg, it has, I am sorry to say, been proved that other countries, I will not say can, but do, produce better cheese than we produce in England; and, therefore, I think we may fairly assume that, with all our increased railway facilities, and with the refrigerating process applied to the keeping of milk, we can bring you milk from any distance, say, even from Cheshire, from Derbyshire, and other dairy counties; and if it was shown to be more profitable than making cheese, as I fancy it would be, a good many of the cheese-making farms would go into the milk trade.

4848. And you think there would be no difficulty in supplying a big town like London in that way?—I do not.

4849. You describe it as one of the advantages of that system, that you would get rid of the keeping of cows in towns under conditions which are prejudicial to health?—I do.

4850. But are all the sheds where dairy cows are kept in the country exceptionally healthy?—In the case of this company, they have an engineer of their own, who goes down and takes a plan of whole of the farm-buildings, the whole of the drainage, the whole of the water supply

Mr. *Wilson.*

15 June 1877.

Chairman—continued.

supply, and everything connected with it, so as to reduce any risk to a minimum.

4851. And you think that, when it is found to answer, private enterprise would produce that condition of healthiness generally in country dairies?—I do; especially when large companies like this only receive milk on those conditions. In the case of Newcastle, to corroborate what I have stated as to dairies being a great source of pleuro-pneumonia, I may, perhaps, say that 75 per cent. of the animals in those byres which die die from pleuro-pneumonia.

4852. And you believe that that large percentage of deaths from disease would be at once stopped by removing the cows from the condition in which they are in the towns?—I do.

4853. I presume that your attention has been naturally directed to this new attempt to introduce dead meat into the country from America?—Yes

4854. Have you had any experienced yourself of that importation?—I cannot say that I have, except that I have seen the meat soon after it has arrived, and I have tasted the meat; that is all my experience.

4855. As a practical and experienced man I should like to know whether, having tasted it, you agree with the other witnesses that when cold it is inferior in quality?—I have not tasted it when cold.

4856. But what you have seen of the meat had been brought over in good condition?—Excellent. It has a great advantage over much of our English meat in the fact that it has some age upon it; it is from an older animal.

4857. And therefore you agree with the witness who was examined at our last meeting, and who stated that the American meat can compete in the market fairly with the English meat?—Indeed I do.

4858. Are you able to speak with any personal knowledge of the power which this meat has of resisting the atmospheric change when it comes out from under this refrigerating process?—No, not practically.

4859. Do you agree with the statement that, if the meat is properly treated before it is sent over, it will stand in this country in hot wheather? I think it will stand much better than our own which in many cases never gets set at all.

4860. You think that the same condition applies to the meat as applies to the milk, that is to say, that the animal heat is cooled out of it, and it is able to resist the atmospheric changes better than the meat that is fresh killed?—That is the point.

4861. Have you, since you have been in the room received a telegram on this point?—I have.

4862. From whom does that telegram come?—From Mr. Tindall, a large salesman of dead meat in Newcastle, who receives his meat from Glasgow.

4863. Therefore it travels by rail after being taken out of the refrigerator?—Yes, it is sent in specially prepared railway vans.

4864. In those railway vans, is the same refrigerating process kept up?—No.

4865. Can you give the Committee the substance of that telegram?—He telegraphs me: "Notwithstanding extreme heat, my consignments of American beef have come to hand the last two weeks in much better condition than during some winter months. Quality superior, and keeping first-rate."

Chairman—continued.

4866. That you would submit to the Committee as the experience of a man who has dealt for some time in this article?—From the very commencement.

4867. Therefore that corroborates what was stated by the flesher from Glasgow the other day as to the quality and the keeping power of the consignments of American meat to Glasgow?—Yes.

4868. You believe, then, that this dead-meat trade will be one on which, when the modes of carrying it are perfected, we can rely for a supply?—I do, and I look upon it as a most valuable introduction both directly and indirectly; for I hope that it will be a means of teaching our butchers in England the real science of their trade. I venture to say that there is no business with which I may be partially acquainted that has shown so little progress and improvement during the last half century, or century, you may say, as butchering; because, whilst we have refrigerating processes applied to both milk and beer and other matters, nothing of the kind has ever been done in England as applied to meat; whereas, in America, I believe it is the general practice in all the butchers' shops. I say this by way of meeting the opinion of men who have come into this room to tell you that meat cannot be kept in this weather. Those men are evidently expressing an English opinion from an English point of view.

4869. That is to say, that the trade has never in any way attempted to bring about by artificial means a condition of temperature in the slaughter-houses which has now for some time been the practice in America, and which is attended, even in a hotter climate than our own, with perfectly successful results?—That is what I wished to express.

4870. And the advantage that this dead meat has over the meat of animals killed by butchers in this country, principally arises from that chilling process which drives out the animal heat, and does not allow it to remain in the beast which is fresh killed, as is the case in England, to deteriorate the whole carcase?—Quite so.

4871. Great stress has been laid by many witnesses before this Committee upon the necessity of having the animals in their lairs ready to kill as the meat is wanted during the hot weather; do you believe that the importation of dead meat into this country will do away with that necessity?—No, I should think certainly not. If the animal in England is to be killed, he must be what you call prepared.

4872. I do not think you quite understand my question. They have stated that it was impossible to stop the foreign import, because the butcher was dependent upon the live animal for slaughtering in hot weather; I wanted to know whether you thought that that was a condition of the trade which could be got over either by the importation of dead meat, or by the establishment of such conditions in butchers' shops as would enable them to keep the meat in a proper temperature for a longer time?—I believe it is a matter of fact, that unless an animal is properly hungered and cooled for a certain number of hours before he is killed, the meat will not keep so well.

4873. Have

Chairman—continued.

4873. Have you any experience, or will your knowledge of the facts enable you to give us any information, as to whether it would be absolutely necessary for the supply of the people that we should have the live animals for slaughter?—I think that there is no necessity for it whatever. As I have already stated, I think the whole of the circumstances point to a dead-meat trade eventually.

4874. You think, therefore, that the retail want that is described for the live animal will gradually disappear?—I do.

4875. That has very much disappeared recently, as a result of the establishment of the dead-meat market in London, has it not?—No doubt.

4876. And whereas formerly the small butcher was dependent upon the killing from day to day, he now takes his dead meat from the Central Market?—Yes.

4877. Is there any other point which you wish to state to the Committee in your examination-in-chief?—I think not.

Mr. *Assheton.*

4878. What do you think is the loss per head that a farmer would suffer with regard to his feeding-stock by getting foot-and-mouth disease established amongst them?—That would depend very much upon many contingencies. If you have a lot of bullocks weighing 60 stone, of 14 lbs. to the stone, the effect upon them would be very different from what it would be upon a lot of bullocks of 40 stone weight. It would depend very much upon the age and stage of fatness of the animal, because, as a matter of fact, an animal approaching a high degree of fatness suffers from foot-and-mouth disease very much more than a lean animal does.

4879. At how much per head should you put the loss in animals which were nearly ready to go to the butcher?—That would depend very much upon the weight of the animal.

4880. Supposing that you had a bullock which you expected to sell to the butcher to-morrow for 25 *l.*, and that it took foot-and mouth disease, and you could not sell it, how much direct loss would you incur?—Probably the direct loss would be 5 *l.*; and then the indirect loss would be the additional time and the additional food required to bring it up to the previous stage; and then I venture to say that the beef would always show the indication of the second feeding.

4881. You think that that bullock, in fact, would never be up to the 25 *l.* mark again?—I do not say that, but you would require to spend so much more money and time and food upon it.

4882. How much would you have to spend upon it to bring it up to the same mark again?—Probably three months' feed.

4883. Your farm, so far as that bullock was concerned, would produce three months' less beef in the year, would it not?—Yes, very much less; and not only that, but I should probably get a greater comparative profit by getting a greater quantity of cattle off.

4884. Do you not think that there would be a national loss to the food of the country as well as to your own pocket?—An immense loss. It is more a question for the consumer than for the producer, I think.

4885. You think that the consumer is quite as much interested as the producer in checking, if not in getting rid of, foot-and-mouth?—Yes, I think he is more so.

Mr. *Assheton*—continued.

Mr. *Torr.*

4886. Has it ever entered into your mind to make a guess at the total loss to this country by foot-and-mouth disease and pleuro-pneumonia since the cattle-plague of 1865; from which would you say that the loss was the greater?—I think that it has been greater from foot-and-mouth disease. I think that the country has lost more by foot-and-mouth disease, directly and indirectly, than it ever lost from cattle-plague.

4887. Since 1865, which was the date of the last great outbreak?—Yes.

4888. Would you say that foot-and-mouth disease or pleuro-pneumonia had been the cause of the greater loss?—Foot-and-mouth disease very much.

4889. When you say a loss, you mean a loss to the meat supply of the country?—Yes.

4890. You think it would be a far greater national boon to get rid of foot-and-mouth disease and pleuro-pneumonia than to get rid of cattle-plague?—I do, because you know exactly what to do with cattle-plague, and you can do it in a much shorter time.

4891. In making restrictions for stamping out foot-and-mouth disease and pleuro-pneumonia, I suppose you would adopt pretty nearly the same *modus operandi* as has been successfully employed to stamp out cattle-plague?—No, not necessarily.

4892. Supposing that pleuro-pneumonia or foot-and-mouth disease were discovered in the dairies of London, you would not necessarily extend your area of restrictions beyond London, would you?—No; and I should make this distinction, that whereas in cattle-plague you slaughter not only animals affected with disease themselves, but also animals in contact with them, in pleuro-pneumonia you would not necessarily do so, but you would simply stop movement.

4893. You gave some very interesting statistics about the supply of towns with milk; do you know sufficient of this Aylesbury Dairy Company to know whether the cattle are kept in healthier condition on these country farms than they would be if they were brought to London?—There cannot be a doubt of that, but the milk varies very much in quality and specific gravity on different farms and on different soils.

4894. Would you say that the milk so produced in the country would be a healthier food than it would be if produced in town?—I do; and, so long as the public are of that opinion, I think I have a right to consider that it is so, because the demand for the milk outside for delicate individuals would rather indicate that.

4895. Could you say that the milch-cows themselves were more cheaply kept on those farms than they could be in towns?—I should certainly think so, but I am not prepared to go into that, for I know nothing about town-keep of cows.

4896. Consequently, milk could be produced on those farms and supplied in London at a cheaper price, or at all events at as cheap a price, as an article of food, as it could be from the local dairies?—I should think so, and I should say that the demand for milk from a dairy like that is sufficient evidence to prove it.

Mr. *Wilson.*

15 June 1877.

Mr. *M'Lagan.*

4897. In addition to the great advantages which are derived from having this milk taken from dairy-farms instead of from cows kept in towns, would it not, as a sanitary measure, be a great advantage to the large towns?—Certainly.

4898. Were it nothing else but a sanitary measure, it would be an advantage to the towns that all the dairies should be removed from them?—I should think so, and I have been much surprised that the sanitary authorities of the towns have not paid more attention to the subject.

4899. You said that there had been a considerable increase in the price of meat since 1863; do you think that that increase arose simply from the short supply of meat?—I do, in a very great measure. No doubt the prosperity of the country in the interval has had something to do with it, but that would only apply to the latter portion of the period. I do not attribute it all to the outbreak of cattle-plague in 1865, but I attribute it in some measure also to two or three outbreaks of foot-and-mouth disease, and the outbreak of cattle-plague in 1872, which have prevented the number of animals ever getting up to its original standard.

4900. The consumption of beef has been very much larger during the last four or five years, or from the year 1870, than it was in the previous years, has it not?—Very much larger.

4901. And therefore the increase of price may have arisen from the increased consumption as much as from the short supply of cattle?—It may.

4902. The effect of the prohibition of the importation of live-stock from abroad will be to increase the price of cattle and beef in this country, will it not?—Not necessarily so, at all; I think it will be more than met in another way.

4903. In what other way will it be met?—By the importation of dead meat.

4904. You think, then, that we are quite prepared to have a total prohibition of the importation of live-stock?—I think the country is.

4905. Do you think that we can get a quantity of dead meat imported into this country, sufficient to supply the wants of the people, without having any live-stock imported?—Considering that you only require about 7 per cent. of the whole consumption to be imported, I think you have every right to expect that you will easily do so.

4906. Supposing that no live-stock were sent into this country at the present time, but only the fresh dead-meat which we get from America, and the salted meat from elsewhere, do you think that there would not be a considerable rise in the price of beef?—I do not, because I am in possession of information to show me that there is not so much meat coming here as might have come this very week, for instance; and more could come from America, if necessary.

4907. What is the reason that they do not send more?—I presume that it is a question of demand and supply, and at this time of the year people naturally do not require so much meat.

4908. We have had it given in evidence that parts of the cargoes that have been sent here have been very much deteriorated, and have not always been fit for human food, and that they have been, in fact, seized by the local authority and condemned; do you not think that the losses that the importers have suffered from that cause may have had some effect in deterring them from

Mr. *M'Lagan*—continued.

sending more?—Not in the least, in my opinion. I am perfectly satisfied that that has not applied to many of the principal importers, and to the fixed principles on which meat is sent here, but it has applied in some measure to those who have been trying experiments to make improvements and alterations in the system of bringing meat here; and I am also perfectly satisfied of this, that the heat in America came in 15 days sooner than usual, and, as you heard the other day, came upon them quite unawares.

4909. Then you consider that the importation of dead meat can now no longer be considered an experiment, but that it is an established trade?—I am quite satisfied that it is so.

4910. And that we may look forward to its going on increasing more and more every week?—Certainly. You will probably find it coming in a more improved form year by year.

4911. If we are to have a large importation of dead meat, the natural effect will be to reduce the price of beef, and consequently the Germans and others who send in live-stock will not find it so profitable to send in live-stock; will not that be so?—That may probably be the case.

4912. Then very probably, without any prohibition whatever, the importation of live-stock will be stopped by natural causes?—I think that it is very likely to be diverted into another channel.

4913. You stated that the beef required for the public consumption in this country, in addition to what is produced here, is only about 7½ per cent.; do you refer to the whole population of the country, or only to large towns, such as London, and Newcastle, and Birmingham?—I am taking it as a basis that the quantity of cattle imported into this country in a live state is about 7½ per cent. only of the total consumption of the whole country.

4914. But the proportion that will be consumed in the large towns will be greater, I presume?—I presume that that is very much so; I have heard that it is as much as one-sixth.

4915. It is the fact, is it not, that the greater part of the beef which is at present imported into this country from America is consumed in the towns?—No doubt.

4916. Very little of it is consumed in the country, is it?—I know some instances where it is consumed in the country, but very little of it has found its way there.

4917. I should gather, from the evidence which you have given to-day, that, though you are a practical farmer, you think that we ought to encourage the importation of dead meat as much as possible?—I do.

4918. And you believe that, though the price of beef will perhaps be reduced by that importation, you, as a farmer, will be better off with a less price, because you will have more cattle to sell?—Yes; and not only that, I should be able to buy my store cattle cheaper, and to sell my fat cattle cheaper, and at a greater profit.

4919. There would be more cattle bred in the country, in fact?—Very many more.

4920. And the nation will be all the richer by having more cattle?—Very much so, indeed.

Mr. *James Corry.*

4921. I presume your opinion is that if the import of live-stock was prohibited from the Continent, a dead-meat trade would very soon arise from

Mr. *James Corry*—continued.

from the Continent?—I think they would very soon adapt themselves to the circumstance of the case. I see no reason why the same thing should not apply to the Continent as now applies to America.

4922. You think the same system that is in use in America for preserving the dead meat could be applied on the Continent as well?—I see no reason to the contrary; and the only reason that I have ever heard is that the Continental cattle themselves, taken as a whole, are of an inferior description to the American cattle, and that therefore the only way in which they can be made saleable in England is by allowing them to come here in their skins.

4923. How would you propose to fix the amount that should be paid as compensation to the owners of cattle when slaughtered under the order of the Privy Council?—That is rather a matter of detail. Carrying out Professor Brown's principle, I suppose there would be some individual appointed in each district who had a fair knowledge of the value of the animals, and who would be within reach of the veterinary inspector of the given district.

4924. In that case the value would vary, I presume, in different localities?—It would be a different individual in different localities, but there would be nothing impossible in getting men in different districts who understand equally well the value of animals.

Mr. *Dease.*

4925. I think I understood you to say that you thought the dead-meat trade would rather improve the condition of farmers in the country; that is to say, they would get store cattle cheaper if the dead meat trade were developed in the country?—I think the dead-meat trade would have the effect of encouraging the farmer to breed more cattle, and therefore that there would be more store cattle available for purchase and for feeding.

4926. If the farmer bought his store cattle cheaper in consequence, would not that affect the breeding and rearing of the young stock?—I think I have shown that a man can breed these animals, and bring them out with all the approved appliances of the present day in the shape of artificial food a year sooner than he could probably otherwise.

4927. In your opinion the lower price of stores which would be created, as you think, by the dead-meat trade, would not affect the breeding of cattle?—No; as a matter of fact I venture to assert that there was more money made among farmers when cattle were more plentiful, and when store cattle were cheaper and beef was cheaper.

4928. Did not that more affect the farmer who bought stores to graze or feed than it did the man who produced; because surely the men who produce, who get a higher price, must be better off than when they got a lower price?—No, certainly not. In my recollection you probably have now to give 4 *l.* or 5 *l.* a head more for the same animal than you had to give ten years ago.

4929. But surely the man who gets that 4 *l.* or 5 *l.* is better off?—Yes, the breeder is one of the agricultural interest, but he is only one of many.

4930. The breeder of the cattle would be a

Mr. *Dease*—continued.

loser, would he not, if his stores sell for less than they have been selling for before?—Not necessarily. I think that a great many breeders could breed a great many more cattle than they do.

4931. Have you ever known instances where stock-masters have turned out cattle suffering from foot-and-mouth disease with young cattle that were in a healthy state, put out upon the land for the purpose of feeding and fattening for the summer, for the purpose of giving those cattle foot-and-mouth disease, so as to have the disease over before they began to get fat?—I believe it has been done in Ireland.

4932. You have never heard of it over here?—I have never seen it.

Mr. *Elliot.*

4933. Do you think that these diseases have had a deterrent effect upon the breeding of cattle by farmers?—Very much so.

4934. And this would account in some way for part of the reduction in the quantity of cattle in the country since 1865, would it not?—Clearly, for the reason which I have given already.

4935. Is it the fact that at the present moment there are an extraordinary number of farms unlet?—I never knew so many, and I never knew so little capital in the agricultural interest as there is at the present moment.

4936. Do you attribute that in any way to the outbreak of these diseases?—I attribute it in some measure to the disease which has decimated the farmers' capital; and that is corroborated, I think, in a great measure by the great number of applications there are to get on to the Agricultural Benevolent Institution. In nearly every instance the application shows that the loss has been caused by some disease or other amongst the man's cattle. I hold in my hands an application from a farmer in Cheshire, in which he says that the loss of his stock by cattle-plague in 1866 was the cause of his downfall.

4937. You told the Chairman that you might be willing to relax the restrictions upon the import of sheep even from countries where disease existed; would you do so in the face of that return which you have before you, and to which you have referred?—You will find that mine was a qualified answer under certain conditions.

4938. You referred to refrigerating milk and keeping it in a refrigerated state; has it not always been considered that that part of the benefit of the milk consisted in the animal heat that was in it?—I never heard so.

4939. Is it not always considered that milk is much more valuable when it is first taken from the cow than it is when it is cold?—I am not aware of it. It is a sort of fallacy on the part of people to suppose that it is a good thing to drink the new milk; that is all.

Mr. *King Harman.*

4940. You do not think that any valuable chemical property is lost by the milk being refrigerated?—No.

4941. In speaking of the appointment of Government inspectors, you said that there would be no opposition by the ratepayers, and it struck me that you rather laid an emphasis upon the word "ratepayers"?—I did, because the Chairman was rather leading me to the point of opposition by local authorities, and I wanted to draw a distinction between the magistrates or local

Mr. *Wilson.*

15 June 1877.

Mr. *King Harman*—continued.

authorities in a county, and the ratepayers proper.

4942. You propose to adopt Professor Brown's plan of dividing the country into districts; and you say that you would treat Ireland exactly the same as England; an immense number, as we know, of young Irish cattle are brought into England to the benefit both of the seller in Ireland and of the buyer in England; how would you propose to deal with those?—I am afraid that I should not be considered a proper authority with regard to the Irish question, but from what I know, read, and hear, I should think that one-half of the fairs of Ireland ought to be stopped to begin with, for the sake of the Irish breeders themselves; because we know that the movement of animals in Ireland is a great source of disease. I believe that, naturally, there is no more disease in Ireland than there is in England.

4943. If you stopped the import of stores from Ireland into England you would cause a very serious loss both in Ireland and in the English market, would you not?—I never ventured to suggest the stoppage of the introduction of stores; they are a necessity, and we must have them; but I meant that we must do all we can to prevent disease getting into Ireland.

4944. But we say we have got the disease, and have got it very largely; Professor Brown's restrictions might possibly last for six years, and during that time it would practically amount to the restriction of Irish stores being exported into England?—I think there is great misunderstanding upon this point. I do not for one moment suppose that there is any one farm in a given district that would be restricted for six years consecutively. What Professor Brown means, I imagine, is that if his system were adopted it would require six years to clear the whole country of disease, and not to clear any one given farm.

4945. But taking a large district, A's farm might be perfectly clear, and in two or three years' time, on B's and C's farms, in that district, an outbreak might take place, and A's farm would still be restricted, I understand?—No, certainly not; the cattle might be removed under license.

4946. Do you agree with the evidence that was given by Mr. Hamilton on Wednesday, that foot-and-mouth disease is ever caused by bad treatment on board the cattle boats?—I do not quite understand what he means by bad treatment on board the cattle boats.

4947. He stated that they were over-packed and under-fed?—As far as the over-packing goes that may be so; but I have suggested that boats ought to be specially built for this purpose, properly ventilated, and duly licensed, so that not more than a proper number should be carried. It is the interest both of England and of Ireland that the cattle should be brought over free from disease, but I am afraid that the lairs both at the port of embarkation and at the port of debarkation are rather fruitful sources of disease.

4948. You suggested, did you not, that the cattle should be detained at the port of embarkation before they were put on board, so that they should not be put on board in a fevered state?—Yes; I think that that would reduce the chance of disease.

4949. An honourable Member on my right asked you a question with regard to cattle being

Mr. *King Harman*—continued.

driven together for the purpose of propagating foot-and-mouth disease; under the present restrictions, when foot-and-mouth disease is in a district, the animals are not allowed to be moved at all, I belive?—I believe not.

4950. If you had a quantity of young stores, and you had foot-and-mouth disease appearing in the fields in which they were, would you think it an imprudent thing to drive the whole lot in together, and let them all have it?—I should, because it is impossible that you can move those beasts from field to field, without contaminating fresh ground.

4951. But my suggestion was that you should put them all into one field?—You must go along a road or something before you can get them all into one field.

4952. I was supposing that fields were conterminous. I have seen men brought up and fined, because, having stores in one field and stores in an adjacent field, they had driven the healthy stores into the infected field, and kept the whole together; what would you think of that?—That might not do so much harm, if you have the disease there; in fact, it might be an advantage in one sense, that you would sooner get the other two fields purified.

4953. On the whole, would you not think it better to let a farmer manage his own stock on his own farm, and not to allow the police or the local authority to interfere with the management of his stock?—Indeed, I do not.

4954. You have spoken of the state of the knowledge that our butchers have of their trade; do you kill your own meat?—I kill my own mutton.

4955. Do you fast your beast before killing it?—Yes, certainly.

4956. I suppose you fast it for 24 hours?—Yes; or over night, or something of that sort.

4957. I think we have evidence to the effect that these American beasts before they are killed are fattened?—Yes, I think so.

4958. Do you believe that, as a rule, these foreign animals, which our English butchers insist that they must have at hand for slaughter whenever they are wanted, are fasted or prepared before they are killed?—I have no reason for knowing one way or the other.

4959. They talk about the meat not being able to be kept in this weather; is it not probable that if they do not fast their beasts properly the meat will not keep?—It is very likely.

4960. As a practical farmer, would you not rather see the prices of stock all over the country lower than they are at the present moment?—I would, uniformly.

4961. Because you would be able to buy cheaper and to sell cheaper, and your risk would be less?—Yes; I think that it would be better for every class of society.

Mr. *Murphy.*

4962. Have you given any attention to the precautions to be taken with regard to the trade at the ports of export from Ireland into England?—No, none personally.

4963. If proper examining yards were established at the ports of export, if those yards were properly paved, and close to the water side, with a constant supply of water, if the pens were disinfected every 12 hours, or every 24 hours, if an opportunity were given to the veterinary surgeon who

Mr. *Murphy*—continued.

who was there to examine the animals, the water being perpetually kept flowing, so as to enable him to examine their feet properly, and if no animal were allowed to pass out of that yard unless it were certified by the veterinary surgeon to be free from disease, do you or do you not think that, combining that with the precautions against moving cattle from farms where foot-and-mouth disease existed, if such a mode were generally adopted, it would be the best means that could be devised to prevent the importation of foot-and-mouth disease from Ireland to England?—I do not see what more you could do, except that I should object to the pavement; but that is a matter of detail. The only danger would be if you allowed fairs and markets to go on. I presume that Irish dealers are very much like English dealers, although they are probably more alive to their work, and they would have their animals privately inspected, and would take out the diseased ones, and let the others go free.

4964. I assume that the cattle that are brought in to the port of export at Cork come by train from up the country. Every head of cattle before being shipped must necessarily pass through the yard that I propose; no cattle would be allowed to be shipped from the port unless it passed through this specified yard, and was penned there for a certain time under the supervision of the examining officer; and no cattle coming from any other part of the country would be allowed to be shipped unless they went through the preliminary process of passing through this yard, and being certified as free from disease; do you not think that such precaution would prevent the importation of foot-and-mouth disease from Ireland into England?—I do not see what further precaution you could take beyond that, in conjunction with improved vessels.

4965. You think that vessels should be specially built for the purpose, properly fitted, properly ventilated, and properly disinfected, that they should be certified by the proper officers, and that these vessels alone should be allowed to convey cattle?—Yes, and that there should be inspection at the other side also; my only fear still being, as I have already stated, that you might bring your cattle from some place where they would be accumulated in great numbers, and that the diseased animals would be taken out of them first; but I think that what you suggest would minimise the risk.

4966. Are you aware of the gross number of live cattle which England imports every year from everywhere?—From 200,000 to 300,000 from the Continent.

4967. I believe that the statistics show that the number is 800,000?—I may be wrong; I do not profess to know anything about Ireland.

4968. Are you aware that 600,000 head of those cattle come from Ireland?—I should quite believe it.

4969. The trade being so very important, is it not the interest of the English farmer who buys these store cattle, and also of the exporter who sells them, that every possible precaution should be taken both at the port of embarkation and at the port of debarkation?—I think that my evidence has indicated the importance which I attach to it.

Mr. *Chamberlain.*

4970. I think I understood you to say that the stock of cattle in this country has diminished by

Mr. *Chamberlain*—continued.

a million head since 1865?—I believe that to be so.

4971. Do you attribute that to the prevalence or to the fear of disease?—I attribute it both to the fear of the disease and to the actual existence of disease of different kinds.

4972. I suppose that the land which would be used in connection with the breeding of cattle has been used instead in growing corn?—Some of it.

4973. Then, if that be so, the consumer perhaps does not lose anything, because he gets more bread if he gets less meat?—Yes, but he can get better from abroad.

4974. Perhaps he can get better meat from abroad?—I believe he can.

4975. I understand that you think that pleuro-pneumonia and foot-and-mouth disease have done even more injury than cattle plague?—I think that foot-and-mouth disease has.

4976. Which of the two alternative proposals which you have submitted to the Committee, do you yourself prefer?—My own desire would be that there should be a total prohibition of importation, for the simple reason, if I may explain it, that, from the evidence which I have heard in this room from Professor Müller, we can have no confidence either in the detection of the disease in Germany or in their restrictive measures on the frontier of Russia, and thus preventing cattle being smuggled into Germany.

4977. That being so, would you also desire that this prohibition of the importation of live stock should apply even if there were no cattle plague; do you think that the diseases of pleuro-pneumonia and foot-and-mouth disease are serious enough to justify the same restrictions as you consider necessary for dealing with cattle plague?—I think they are on the whole, although there are countries to which an exception applies which have not the disease. I may instance Denmark.

4978. Would your restriction apply also to Schleswig-Holstein, which has been proved to be practically free from disease?—I should treat Schleswig-Holstein certainly as part of Germany, because it is within my own knowledge that cattle that come into the Newcastle market from Schleswig-Holstein at certain times of the year bring more disease than any other foreign cattle.

4979. You would not treat Ireland as a foreign country?—Certainly not.

4980. Do not pleuro-pneumonia and foot-and-mouth disease come from Ireland?—Yes, but by carrying out Professor Brown's restrictions we should reduce that to a minimum.

4981. If you do not rely upon those restrictions in the case of other countries why should you rely upon them in the case of Ireland?—Because Ireland is under our own control and other countries are not.

4982. The evidence which has been given here tends to show that the restrictions in foreign countries are much more stringent than the restrictions in Ireland?—Still they get the disease.

4983. I understood you to say that 75 per cent. of the deaths of cattle at Newcastle-on-Tyne were owing to pleuro-pneumonia; did I correctly understand you to say that that number of deaths was caused by treatment in the byres?—It is proved by experience that the disease is perpetuated in this way: an animal which is proved to be infected with pleuro-pneumonia is immediately slaughtered, and compensation is paid to

Mr. *Wilson.*

15 June 1877.

Mr. *Chamberlain*—continued.

the extent of three-fourths of its value; the owner of the animal then goes into the market and adds 1*l.* or 2*l.* or nothing, as the case may be, to the amount which he has received as compensation and buys another, and probably an inferior animal, and brings it into the same stall on the same day, or the day after the other one has gone out, and the disease is thus perpetuated.

4984. Do you know any cases in which pleuro-pneumonia or foot-and-mouth disease originated without contagion?—My own experience has been, that I have been always able to account for it.

4985. Of course, it must have originated spontaneously somewhere or other; even if you stamped it out once, might it not have recurred owing to the conditions of treatment?—I am not prepared to admit that at all.

4986. You do not know about it?—Yes, I do a little, but I am not prepared to admit that it originates spontaneously.

4987. Of course, it must have some cause, but might not the cause be the treatment of the animal and not contagion from already existing disease?—No, but I think that the treatment might render them more susceptible of disease.

4988. The disease must have had some origin, of course?—Yes, that is what we say, and we have it from abroad. The returns, I think, show you the proportion to the number of cargoes of foot-and-mouth disease that come from abroad.

4989. I know that it frequently arises in this country in consequence of contagion imported from abroad; but might it not arise even without contagion?—I do not think so, because the railway facilities, and other facilities, are so great that it may be carried from one part of the island to the other without anyone expecting it.

4990. You say that you would rely, as compensation for the trade in live cattle which you would prevent, upon the increased importation of dead meat?—Partly so, and partly also upon the increase of cattle bred in this country.

4991. Did you hear one of the witnesses say that disease might be imported by means of dead meat?—I heard Professor Brown say that it was not very probable.

4992. You would not take any account of it?—No.

4993. You would not think it necessary to make any restrictions on that account?—When cattle plague exists in Germany, I think you are justified in prohibiting it.

4994. Is it not the case that nearly 200,000 cattle come from the Continent to England?—The Continent is a large place, whereas from Germany only about 55,000 cattle come, and the loss of those would not be very much felt.

4995. More than that number, 69,000, come from Schleswig Holstein, and those you entirely prohibit, whether alive or dead?—I should for the moment.

Chairman.

4996. That is under the condition that the cattle plague exists there?—Yes.

4997. And that is a condition which now exists under the regulations of the Privy Council?—Yes.

Mr. *Chamberlain.*

4998. Do you agree with Mr. Sheldon, who told us that dead meat could be brought more cheaply from America to this country than live cattle?—His statistics satisfied me that it might.

Mr. *Chamberlain*—continued.

4999. Do you not think that it might be left to the ordinary course of trade under those circumstances, and that if it is more profitable to send dead meat, than live cattle, they will do so?—I fancy that that is the condition of it at present.

5000. If that is so, is it necessary to impose any new regulations?—I think that it is most necessary to impose all restrictions to keep out disease. We say, bring us all the meat you can, but do not bring us disease, and if we are satisfied that your live cattle could come from all parts of the world, without bringing disease, we say let them come.

5001. But, if Mr. Sheldon is right, there is a profit of something like 4*l.* a head upon the importation of the carcase, as compared with the importation of the live cattle; might you not trust to that, without any further restrictions upon the import of cattle?—I think experience shows that we cannot trust to it.

5002. How do you send up your own meat to London?—I do not send it to London at all. My meat goes to Leeds, Wakefield, and Newcastle.

5003. How do you send it; do you send live cattle, or dead meat?—Live cattle.

5004. You are anxious to impose these stringent restrictions upon the foreign trade; would you object to submit to them yourself?—Certainly not; I have had to do it.

5005. You would not object to there being a prohibition of the transit of live cattle in England?—I have stated that I accepted Professor Brown's answer to Question 310, in which he says that he would propose to divide England into districts, and appoint a Government inspector for each district, and then restrict absolutely the movement of cattle where pleuro-pneumonia or foot-and-mouth disease broke out.

5006. But in all cases, would you be satisfied that the transit of live cattle should be prohibited, and that only a dead-meat trade should be allowed in this country?—That does not apply to the disease at all. I am prepared to submit to any restrictions, as suggested by Professor Brown, that can be imposed upon my own district, so long as these two conditions are complied with: first, that the authority shall be vested in the Privy Council; and, secondly, that we shall be satisfied that the Government of this country give us every protection from the disease at the ports.

5007. So far as foreign countries are concerned, you would prohibit the importation of live cattle even from healthy countries?—I have not said so.

5008. You say that you would prohibit it from Schleswig-Holstein, and from every other country except Ireland; you prefer the total prohibition?—Yes.

5009. Your preference is for a scheme under which the exportation of live cattle should be totally prohibited, even from healthy countries?—I am forced to that opinion from the fact that, with all the restrictions which we possess, cattle plague, and other diseases, have got into the country.

5010. Then, within your own boundaries, would you not also prefer that there should be no trade in live cattle; if you were restricted entirely

Mr. *Chamberlain*—continued.

entirely to dead meat, you would obtain greater security, would you not?—Yes; but I think we could do with less of it.

5011. If the dead-meat trade can be conducted more cheaply than the live cattle trade, would not that apply also to internal arrangements?—Yes, if it is proved to be of equal advantage to the country, and to be of equal advantage to me as a tenant farmer, I should have no objection to it.

5012. If the freight upon dead meat is less than the freight upon live cattle, would it not be cheaper and better altogether that you should be confined to the dead-meat trade entirely?—I think that we should probably be more secure; I should not object to it a bit if it was necessary.

Mr. *Norwood.*

5013. You do not appear to have seen any of the live cattle that have come from America?—I have not seen them landed, but I have seen them after they have been landed.

5014. Were they in very good condition?—They were very fine cattle.

5015. You seemed to think that the trade in live cattle from America was falling off?—I have not said so.

5016. I thought in answer to a question which was put to you by an honourable Member just now, you seemed to imply that it was falling off; are you aware of the fact that it is very largely increasing?—Very possibly it may be.

5017. And that some exceptionally fine cattle have arrived within the last week or two?—Very likely.

5018. And yet you want to see importation prohibited?—Yes, I think we are forced to that opinion; I am very sorry that it is so; but I think it is so.

5019. Are you of opinion that the country dairies are generally cleanly and well conducted?—My experience is that they are, as a rule; but you will find all sorts.

5020. With regard to the Aylesbury Company, it is a public company, I presume?—I believe it is.

5021. And it publishes its balance-sheet?—I do not know anything about its balance-sheet.

5022. Is it a commercial success?—I have every reason to believe that it is; it has doubled and nearly quadrupled its size in a very short time.

5023. Do they get an increased price for their milk over the London dairies?—I am not prepared to say that; I know that they get an increased price for their butter.

5024. You said something to the Chairman with reference to Newgate Market, as to its being the practice of the small butchers to obtain dead meat lately; has it not always been the rule that the small butchers in London bought their supply of dead meat for their customers?—I was not speaking more especially of the Newgate Market; but I believe that the tendency of recent years has been very much to reduce the number of small slaughterhouses; the small butchers do not slaughter for themselves, but prefer buying from wholesale slaughterhouses.

5025. I thought I heard some reference made to the New Central Market in London as having originated that system?—The remark was not specially intended to apply to that.

5026. The new Central Market arose, to a certain extent, owing to the removal of the Newgate Market, and the removal of the Leadenhall-street Market, did it not?—Yes, possibly.

Mr. *Norwood*—continued.

5027. You have not gone into the details of the difficulty attending the fitting up of steamers specially for the continental cattle trade, or for the American cattle trade, have you?—No.

5028. You have not considered what difficulty there would be in fitting out a ship for America, for instance, to convey a comparatively limited quantity of stock, and especially of dead meat, that would come at any one time?—I have seen sufficient to know what it does cost.

5029. Are you aware that at the present time the quantity of live cattle that a steamer from New York would bring would be a very small proportion of its total capacity?—I can quite imagine that.

5030. Supposing that a law were passed that no cargo, other than cattle, was to be carried in a vessel, would it not render the importation of live cattle an impossibility?—It would, no doubt, very much increase the cost of sending them.

5031. It would really prohibit it, would it not?—Practically so.

5032. Your suggestion about restricting the conveyance of cattle to special boats would, in fact, be another form of prohibition?—It would; but I am driven to that opinion by facts.

5033. Do you mean in the New York trade?—No; but in any trade if you bring diseased cattle over in contact with passengers, and with the crew, and with merchandise, and then land your cattle at one place, and the rest of your cargo at different places, there is a probability of your disseminating the disease throughout the length and breadth of the land.

5034. When there is a case of cattle plague on board?—Yes, and the same possibility in the case of other diseases.

5035. Would you prohibit the National Line and the Inman Line, and the Cunard Line, bringing any cattle from New York?—I think that in the case of any country where there has never been disease there might be an exception made. I was speaking more particularly with regard to the Continent; I did not refer to America when I answered the question.

Mr. *Cameron of Lochiel.*

5036. Can you tell me whether the farmers who supply this Aylesbury Dairy Company have experienced any difficulty in obtaining ice for refrigerating their milk?—None whatever, I believe; and I venture to think that the difficulties of procuring ice is one which is unnecessarily raised. I believe that ice can be artificially manufactured at about the price per ton which it costs for coals per ton.

5037. So that if the butchers of the country were to adopt your plan of refrigerating their meat as soon as it was killed, you think that the question of the supply of ice would not present any difficulty?—Not in the least.

5038. You have heard the evidence which has been given us from abroad, that in Denmark and in Germany it is anticipated that the difficulty of obtaining ice would rather operate against the exportation of dead meat; but, in your judgment, that is not a difficulty which might not be overcome?—Not in the least, because you have it in your power to make your ice artificially at the same price that coals cost you per ton.

5039. With

Mr. *Wilson.*

15 June 1877.

Mr. *Cameron of Lochiel*—continued.

5039. With regard to your second alternative, how would you propose to deal with store cattle that arrive from countries from which importation is allowed?—I should make no distinction between store and fat cattle.

5040. But I understood that the fat cattle were to be slaughtered at the port?—My experience of the cattle coming from Denmark to Newcastle at the rate of 1,000 a week is this, that they all go into the market, after the proper detention of 12 hours, and there is no difference made between store and fat cattle. If a cow is bought for a dairy, well and good; if not, she goes to the butcher.

5041. So that you would not propose to make any distinction between store and fat cattle?—Certainly not.

5042. You would not allow store cattle to be kept in quarantine in a port?—No, I think that quarantine is a hotbed of disease.

5043. Store cattle that are merely store cattle would probably not be imported at all?—No, I do not think that they would; I do not think that we want them.

5044. Have you read the report of the Committee of 1873?—No; but I have looked into it.

5045. Has your attention been called to a statement which was handed in by Mr. Duckham, who is, I believe, the editor of the "Hereford Herd Book," with reference to the estimated loss in 1872 from foot-and-mouth disease in Herefordshire, and the deduction made from that loss as to the general loss throughout the country?—I remember it at the time he gave his evidence.

5046. The total estimated loss in that year he makes out to be 19,500,000*l.* throughout Great Britain and Ireland; have the Royal Agricultural Society obtained any statistics, or endeavoured to make any calculation, of what the subsequent losses from foot-and-mouth disease have been since 1872?—No, not directly. It is rather in contemplation to follow up that subject, I think, after we have thoroughly investigated the subject which Mr. Sheldon is now engaged upon.

5047. The year 1872 was the worst year for foot-and-mouth disease, I suppose, that was ever known?—1869, 1871, and 1872 were bad years. I believe it was reported by the Government that there were 500,000 animals affected by foot-and-mouth disease in 1871.

5048. Which was the worst of the three years?—1871, I think.

5049. Subsequently in 1872 was there anything approaching to it?—It was all one outbreak.

5050. You believe that the Royal Agricultural Society will give some statistics on that point?—I believe it is a matter that they will take up; but they are not in a position at present to do it.

5051. If there is really ground for believing that in one year the total estimated loss was 19,500,000*l.* by foot-and-mouth disease alone, whereas the total value of the meat imported in that year was only 4,600,000*l.*; does not that form rather a strong argument in favour of the views which you have been expressing with regard to importation?—I think it forms a very strong argument indeed.

Mr. *French.*

5052. Have you thought of the effect of these proposed restrictions upon the importation of store cattle from Ireland?—I think it would have this effect: that we should have much greater security in the introduction of store cattle from Ireland, by endeavouring as far as possible to guard Ireland from disease from external sources.

Mr. *French*—continued.

5053. Are you aware what is the class of dealers who bring most of the store cattle to England?—I have seen a great many of them.

5054. As a rule, I believe they are men of very small capital, who go about from fair to fair and buy up the stock in Ireland, and then bring them over here?—I expect that that is the case.

5055. Do you not think that any severe restrictions would be likely to make a good many of those men bankrupt?—That is quite possible; but I can only say this much; that there is no doubt that restrictions apply more to cattle salesmen and to cattle dealers than to farmers; and I venture to assert that any complaint that has arisen, so far as regards restriction lately, or at any time, has been tenfold, more on the part of the middlemen than it has been on the part of either the consumers or the producers.

5056. I understood you to say that you would stop about half the fairs in Ireland?—I said that I thought it would be a good thing for the Irish cattle, and for Ireland itself.

5057. Then you think that there are too many fairs in the country at present?—Yes, because the Irish dealers drive the cattle from fair to fair, and we know that the movement of cattle is a great source of the spread of foot-and-mouth disease through Ireland.

5058. But would you stop these fairs at present?—Only when an outbreak occurred.

5059. Would not it be a sufficient restriction merely to stop the movement of cattle, and of fairs and markets, within the prescribed district, under the Privy Council?—I am assuming that it is all done through the Privy Council; but I believe that the present restrictions in Ireland, are carried out on a different principle from what they are in Ireland, and therefore I would rather not express any opinion with regard to the internal working of Ireland, because I know nothing about it; but it is my idea, from what I am told, that the disease has spread in Ireland in consequence of so many small fairs being held.

5060. At present I believe it is the fact, that in Ireland the management of the country with regard to these diseases is more or less carried on by the Government and not through the local authority?—It is carried on, I believe, by the Veterinary Department in Dublin, in conjunction with the police.

5061. With regard to refrigerating the English meat, do you not think that that would raise the price of meat?—I do not see it.

5062. You say that the cost of ice would be about the same as that of coal; that would be an extra expense upon the butchers, would it not?—A very small expense indeed, if you understand what the effect of a ton of ice would be.

5063. It would be a certain amount of expense, at all events?—I should think that the butcher would be more than compensated by the meat that he would save by it.

5064. Do you not think that he would make his customers pay him that expense?—It is quite possible. I fancy that the butchers do make their customers pay for most expenses.

5065. Is

Colonel *Kingscote*.

5065. Is it not the case that you may cool meat very well by means of outside blinds and other ventilating processes, without having ice?—Yes.

5066. Is it not done very largely in America and elsewhere?—I believe so; but still the main principle is getting the animal heat out of the meat first.

5067. With regard to milk, you used the word "refrigerating"; but there is no ice used by the farmers where the milk comes from; it is done by ventilation and a cooling process, is it not?—No; it is not done by putting ice in direct contact with the milk, but by placing ice-refrigerators round the whole of the cans. The farmers are bound by agreement to refrigerate their milk under a penalty.

5068. Are you aware that about Swindon and that district many farmers have given up making cheese, and that they now supply this and other companies with milk?—I am told that that is so.

5069. Do you know anything as regards the cost of bringing cattle, alive or dead, from Hamburg to London?—I have statistics to show that it is about 1*l*. 6*s*. 3*d*. per head, for live cattle.

5070 Do you know what they charge for a carcase?—About 4*s*. a quarter, or 16*s*. each carcase.

5071. Then the cost of bringing live animals would be very much more than the cost of bringing a carcase from America, would it not?—Yes. The charge of 1*l*. 6*s*. 3*d*. for each live animal from Hamburg is nearly the same as the charge for bringing a carcase from New York.

5072. Does that 1*l*. 6*s*. 3*d*. include merely the freight, or does it include the food of the animal?—It includes freight and other charges.

5073. The cattle do not require much forage, I suppose, in coming from Hamburg to London?—No; it is only a short distance.

5074. From what you know of the trade with Germany and Denmark, do you think there would be much difficulty in procuring ice for a dead-meat trade?—No difficulty at all. It is in your own hands; if you cannot get the ice naturally you can produce it artificially.

5075. As regards the restrictions for preventing foot-and-mouth disease, or any other disease in the country, do you not believe that although the original cost of the appointment of those inspectors and of the other arrangements would be great, yet in the end it would be much cheaper to the country?—I think it would be very much cheaper. I do not see that it would be very much more costly to begin with, because we have 1,800 inspectors now, and we should only require 2,000.

5076. Even if it had cost a little more, you you would not mind that if the result of the increased expense was to reduce the chance of your getting disease amongst your cattle?—We should most gladly pay it.

5077. Is not six years a very much longer time in which to get rid of these diseases than you would like to contemplate?—It is quite an assumption; I should not have thought that it would take so long a time; if you did not exterminate it in half that time, you would reduce it very considerably.

5078. I gather from you, as a farmer having a knowledge of the breeding of animals, that although you might think this dead meat coming into the country a very formidable competition,

Colonel *Kingscote*—continued.

yet you do not fear it as long as you are protected from disease?—I do not, certainly.

5079. You do not despise the formidable competition of this dead meat?—No; on the contrary I rejoice to see it.

Mr. *Arthur Peel*.

5080. When the resolution was passed at the Royal Agricultural Society prohibiting the importation of European cattle, was anything said about American cattle?—No, we did not touch upon that; my resolution pointed to European cattle.

5081. Was that because they thought the American live cattle trade insignificant?—I think, in the first place, we thought that it was not probable that it would be carried on on a large scale; and, secondly, that if it were, as there had never been any cattle plague in America, there was not the same risk.

5082. Are you aware what the quantity of live cattle imported from America now is?—No, I am not; I have only heard it.

5083. Your main position, therefore, is total prohibition of live cattle?—Speaking generally, I feel that I should be most secure with that.

5084. And yet you admit that, under some circumstances, cattle may be introduced alive, provided they be slaughtered at the port of debarkation?—Yes, so long as I have ample proof that I have every security in their own country.

5085. Would that apply to all the three diseases?—That would apply to all infectious aud contagious diseases.

5086. Therefore, as long as foot-and-mouth disease, pleuro-pneumonia, and cattle plague existed in a foreign country, you would not allow cattle from that country to be introduced alive, but you would have them slaughtered at the port of arrival?—I should prefer their not being introduced alive, but I should not see any great harm in their coming from Denmark where I was satisfied that there was a very small chance of disease. That is my alternative.

5087. You gave us some statistics which, unless I misunderstood you, tended, in your opinion, to prove the great loss that this country had sustained from the outbreak of cattle plague of 1865, and you said that there were less cattle in the country now than there were previously to 1865?—I believe that there are a million less.

5088. If you will kindly look at the figures which you gave us of the price of meat during that time, you will see that it is not a continuous increase?—No, not quite.

5089. Can you explain the fluctuations, because I notice that in some of the years, even since 1865, the price diminishes?—You will observe that, in the two years previously to 1865, the mean price of meat was 5¼*d*.; if you look at the other figures, you will find that it never came down to that standard again.

5090. But it got to 5¾*d*.?—It did, in 1867, when beef varied from 4¼*d*. to 6¾*d*.

5091. What was the reason of the drop there?—It might probably be that at that time that the demand was not so great, or something of that kind; the trade of the country might not be so good.

5092. Do you not think that there were other reasons to account for the increased price besides the cattle plague of 1865?—Certainly; but there were other outbreaks of cattle plague, which diminished

Mr. *Wilson.*

15 June 1877.

Mr. *Arthur Peel*—continued.

minished the food of the country, and then there is also the prosperity of the country in recent years. In my own experience, in a large county where there a great many collieries, the labouring class have learnt to eat beef, and they have not forgotten it.

5093. Are you aware what was the foreign importation of meat during the period from 1865 to the present time?—In 1872, about 5 per cent. was the importation of live stock, but I am not prepared to show the quantities.

5094. It is important that we should have that before we can form a conclusion, is it not?—Yes; but I think the price very much indicates the quantity.

5095. You said, I think, that the reason why there were no foot-and-mouth returns was because the Government were so frightened at the dimensions of the disease that they had refused to ask for any returns; are you aware that the farmers themselves were asked to make returns of foot-and-mouth disease, and that they objected in consequence of the great expense and of the inutility of the returns?—It may have been partially so, but some would make a return; the farmers do make returns.

5096. But if some made a return and others do not the value of it would be destroyed?—Then it may probably diminish the value of the present statistics altogether.

5097. Are you aware that in January 1876 the Privy Council asked farmers not officially, but privately, if I may so say, for returns of foot-and-mouth disease, and do you know whether any returns are furnished by farmers in your part of the country as to foot-and-mouth disease?—No doubt our local authorities have those returns, but what use they may have made of them I cannot tell you.

Major *Allen.*

5098. I suppose that the police have all the information about the number of animals that have been attacked, and the number of animals that have died from pleuro-pneumonia?—Yes, the local authority would know the number.

5099. You were not examined before the Committee of 1873, were you?—No.

5100. That Committee, in their report, say with respect to foot-and-mouth disease, "Your Committee have come to the conclusion that it is hopeless to attempt to extirpate, or even materially to check, this disease, unless the above-mentioned stringent measures are strictly enforced; and they also believe that such enforcement would require a costly and numerous staff of inspectors, an amount of supervision by the central authority which would excite much local opposition, at any rate in Great Britain, and such an interference with the home trade in animals as would much affect prices, and would induce not only the consumer but the producer to consider the remedy to be worse than the disease." Do you agree with that?—I think that there has been a very great change of feeling amongst the agricultural interest of the country since that time.

5101. What you want particularly is uniformity of action?—That is all we ask for.

5102. And you want the Privy Council to manage all these affairs, because they would appoint inspectors far better fitted for the work?—Yes.

Chairman.

5103. I should like to be quite clear with regard to your views as to the question of dealing with the Irish cattle; I understand you to say that you wish absolutely the same regulations to be adopted in Ireland as are adopted in other parts of the United Kingdom?—I refer more to the external treatment, you may say, of Ireland at the ports. Within Ireland, I am not quite clear as to how it works at present, because I know it is different from our action in England.

5104. Your object in England seems to be to bring about uniformity?—Yes.

5105. And you answered me, I think, that in Ireland the same regulations with regard to foot-and-mouth disease should exist as exist in England; that implies dividing Ireland into districts and appointing government inspectors, and stopping the movement of cattle within districts where the disease arose?—I should think that that would be the best plan, although there may be something connected with Ireland of which I am ignorant.

5106. If that was adopted the Irish stores would come freely into this country as they do now, from all districts that were not under restriction?—I think they would come more freely.

5107. And by degrees, stamping out the disease, as you hope to do by these restrictions, there would be perfect freedom for those animals?—Clearly; that is my object.

5108. An honourable Member has asked you with regard to this resolution that you moved as to the stoppage of imports, and its application to the American live cattle trade; I understand that that resolution applied entirely to European cattle, and that this question of American cattle was not contemplated by the society at all?—No, never; that is why the resolution specially applied to European cattle.

5109. At the same time should such a restriction as to the absolute prohibition of the import of live animals be enforced, it would apply to the American trade?—Yes, although I do not quite see the same reason for it.

5110. Therefore, do you not think that that is an additional reason for your alternative scheme?—I do.

5111. And American cattle would therefore be treated the same as Denmark cattle, or as cattle from one of the scheduled countries?—Yes; and I must go further than that, and say, that from a country like America, which has never known disease, and where there has been only one case probably of foot-and-mouth disease imported from England, I think that there would be very little harm, under certain conditions, in allowing cattle to come into England and remain, especially for breeding purposes.

5112. You think that even further relaxations might be made with regard to America?—I do.

5113. Have you had your attention called to the evidence that has been given before this Committee as to Texan fever, which is almost as bad in its effects as cattle-plague?—Yes; Professor Brown, I think, mentioned it to you.

5114. And that does not alter your opinion as to the freedom to be granted to American cattle?—It would be done, of course, under certain restrictions; I should require to be perfectly satisfied first that they were clear from disease; and Professor Brown said that Texan fever, I think,

Chairman—continued.

was not likely to exist or continue in this country.

5115. I suppose you think that the length of the voyage gives you additional security in the case of American cattle?—It does.

5116. With regard to the restrictions which you suggest for dealing with pleuro-pneumonia and foot-and-mouth disease in this country, and the way in which they affect the question with regard to the foreign import, I think I understood you to say that the proposals which you suggest with reference to foreign cattle are suggested with a view of working together, with your home restrictions, for the absolute abolition of these diseases?—Yes; it must be done conjointly, or not at all.

5117. And you are obliged to take more stringent measures with regard to foreigners than you are with regard to the home trade, in consequence of the difficulty of dealing with foreigners, over whom you have no control?—That is so.

5118. I think you stated that you would absolutely stop the importation of store cattle into this country from European ports?—Yes, I believe it to be a necessity.

5119. You believe that store cattle for English farming purposes are not required?—I do.

5120. Has you attention been called, in connection with the dairy part of the store-cattle question, to the fact that we are in a large measure dependent in some of our town dairies upon the Dutch cows?—I am told that we are to a small extent.

5121. There is a large importation of Dutch cows in consequence of their wonderful milking power?—There is no great number. I have heard that it is 20,000 per annum, but I do not know whether that is correct.

5122. And you think that for dairy purposes that number might be done without?—Very easily, for the reason which I gave you a while ago, viz., that I think that it will be found to be more profitable to produce milk than to produce cheese at home.

5123. And, therefore, a very much larger field of milk supply would be opened up in the country as soon as the want in the towns was felt?—Yes.

Chairman—continued.

5124. You stated, in answer to an honourable Member, that you thought, though a reduction would take place in the price of your stock from this importation of dead meat, it would rather benefit you?—Certainly.

5125. Applying that to the very small cottier farmers, of whom there are a large number in Ireland, who have one or two or three cows, and who sell the produce as yearlings, would not the reduction in price affect them more seriously?—I do not see why it should. As I have already stated, a great many of them can produce more, if they want to do so.

5126. But would these small men with very small occupations be able to produce a sufficient increase of stock to cover the reduced price?—I could not say how it would affect the cottiers, because I do not know anything about them in Ireland. I am speaking as a large farmer; I take the whole question as a large question.

5127. You refer to the large farms with which you are acquainted, and in which you believe that the greater amount of stock that you would be able to produce would cover the reduction of price?—Yes; it is impossible to make any great alteration in a system without interfering in some degree with some individual interest.

5128. At the same time, that question does arise with regard to Ireland, because it is a general state of things in that country?—I believe that the agriculturists in Ireland are of a very small class, with small holdings, therefore the loss of a cow or calf from disease would be a very serious matter.

5129. I think that you are able to answer a question which was asked of another witness, with regard to the number of counties in the country where the present regulations have been adopted by the local authority?—There are 36 counties and 29 boroughs in which there are restrictions with regard to cattle-plague.

Mr. HERRMAN GEBHARDT, called in; and Examined.

Chairman.

5130. I BELIEVE you have been now for many years interested in the importation of foreign cattle into this country?—I have.

5131. I think you were one of the original importers?—I believe that I was one of the first.

5132. And as such you have naturally had very great experience of the trade in foreign animals?—I have.

5133. You were examined, I think, at considerable length before the Committee of 1873?—Yes, and in 1868 as well.

5134. And you gave a considerable amount of information to those Committees on this very point?—I did.

5135. Your attention has been naturally directed, I presume, to the recent outbreak of cattle-plague in Hamburg?—Yes.

5136. That outbreak spread to this country, as we know, by the introduction of animals through the ship "Castor"?—Yes.

5137. Do you think that the information which we received was sufficient, or that the system under which we received information from that country, in this instance, was satisfactory?—I think it was not satisfactory.

Chairman—continued.

5138. Do you think it would be possible to amend it?—I think it would.

5139. From your practical knowledge of the working of this trade, how would you suggest that we might strengthen our hands by foreign information?—I believe that the information might have been here 24 hours before we received it. It appears that the outbreak of cattle-plague in Hamburg was known officially on the Sunday morning.

5140. That was the day on which it has been stated in evidence before this Committee that the telegram went to the central authority in Schleswig, and lay there during Sunday?—Yes.

5141. You would, then, confirm the suggestion that has been made by the witness from the German Government, that that information might have been more readily given to the Privy Council here,

Mr. *Gebhardt.*

15 June 1877.

Chairman—continued.

here, if the new rule which they suggest had been in force, of making the inspector, where the disease is detected, telegraph direct instead of through a central office?—I certainly think that that ought to be done.

5142. You think that that would have given us, in this instance, such security as would probably have enabled us to take better precautions on the arrival of the "Castor"?—I believe that if that security had been given the "Castor" would not have been allowed to land her cattle, because we should have received the information 24 hours before the steamer arrived.

5143. Do you think that what was done was satisfactory, as soon as it was known, and the cattle arrived at Deptford?—No, I do not, because I think there was too much delay before the cattle were killed, and actually afterwards destroyed.

5144. It was stated by another witness that some time elapsed after it was discovered that it was cattle-plague before they actually killed the animals?—I believe that that was so.

5145. How would you strengthen the regulations, so as to deal with the omissions which you think occurred then?—I first of all would say, that there ought to be an understanding with foreign Governments that the moment cattle-plague appears this country should be informed of it; but as we only deal with one country where cattle-plague appears, viz., Germany, and as they do not keep it a secret when it exists there, there would not be the slightest difficulty in our having the same information. If cattle-plague breaks out in Prussia, the law is enforced instantly, and it is published at the places where cattle-plague appears; in fact, no cattle are allowed to come out from the place. As we can get no cattle from Germany, on an average, under 48 hours, we should always know long before the vessel arrived that they had the cattle-plague; and if any steamer were on the route, we could stop her landing.

5146. Then you think that proper telegraphic information might be relied upon to stop the landing of diseased animals?—I believe so.

5147. And that the reason why we had not been able in this case to prevent the introduction of cattle-plague was principally the imperfect information, which you believe is not necessarily imperfect?—Just so.

5148. Has your attention been directed to the evidence that has been given by Professor Müller and by the Baron von Behr as to the further restrictions which they propose to adopt in Germany in consequence of this outbreak?—It has.

5149. Are you of opinion that those restrictions will strengthen our protection against the importation of disease?—Yes; I think they must do so very much indeed; because I fancy that if they carry out what they propose, cattle plague could never escape out of the country.

5150. You mean that the restrictions which they suggest would absolutely protect us against cattle-plague, even if it arose in that country?—Yes.

5151. I suppose that Germany, as a country, has herself the greatest possible interest in preventing the introduction of disease into her herds?—Yes, of course they have, because they not only have to protect their cattle, as we do, for meat purposes, but they use them for agricultural purposes; they do all their ploughing by oxen.

Chairman—continued.

5152. Through a large portion of Prussia they are absolutely dependent upon their oxen for the tillage of the land?—That is so.

5153. Therefore, whilst we have the inducement in this country of protecting our meat supply, they have the additional inducement, of course, of protecting the means by which they till the land?—That is so.

5154. Therefore Germany is naturally anxious to bring about any regulations which would give her security, independently of her wish to continue a trade with this country?—Yes, and they have much more severe power than we have in this country.

5155. Being more despotic in their government, they are able to use stronger powers and greater restrictions with regard to these diseases?—I believe that in Germany a great deal of the law is all in one hand in this matter; while here it appears to me that with the local authorities it is one authority against the other, which I think in such a case should be entirely abolished, and it should be one law of the land.

5156. You agree with the last witness that the power of the local authority should be done away with, and that the Privy Council should take the complete control of the regulation of these diseases in the country?—I believe that in the case of cattle-plague there should be no doubt about it.

5157. Do you separate the question of foot-and-mouth disease and pleuro-pneumonia from the question of cattle-plague as to the regulations that should be applied?—Entirely.

5158. I understand you to say that you are of opinion that for the purpose of dealing with cattle plague the powers at present existing in this country under the Act should be transferred to the central authority?—I believe that that would be the best way.

5159. You are aware of the mode in which it is dealt with by the Privy Council here at the present moment?—I think I know most of the rules and regulations.

5160. You know that the Privy Council have the power of taking upon themselves at any time they please this restrictive authority?—Yes.

5161. And you suggest that the present Act should be repealed, and that that Order of Council, enabling them to do it when diseases arose, if they thought it necessary, should be made compulsory and general?—Yes.

5162. To go back to the landing of animals at Deptford; in case disease breaks out, is there anything which you would suggest as a greater security for our protection in this country beyond your recommendation that the animals should be more quickly slaughtered?—I believe that the way in which these cattle were treated was as bad as could be, because they were allowed to remain a day or two before they were killed; I believe the last were killed on the Thursday, and the remaining part of the bodies were not destroyed or boiled down until the following Wednesday. I do not believe there were 40 left at the time; some died on landing; but they actually took very nearly a week before they were boiled down; they were laid at Deptford, and only some lime was sprinkled over them.

5163. The process which is adopted there is not

Chairman—continued.

not to bury them, but to boil them down?—Yes, and they said there was not sufficient accommodation to do it, and consequently these cattle were left lying about dead for six or seven days.

5164. You would then suggest that the burying of the body should be made absolutely compulsory instead of the system of boiling down?—Yes, that is the mode which is adopted in Germany, because then you can destroy a great number of cattle at once, but if you boil them down it is a slow process, and you can only destroy a certain number in a day.

5165. And you think that the German system of digging a large trench and burying them at once gets rid of the possibility of contagion?—Yes, they not only destroy the bodies at once, but they pull the building down and burn it. In Hamburg, they burnt the whole cattle market, every stick of it, this last time.

5166. That shows not only that they have greater powers, but very much stronger restrictions in Germany than we have in this country?—Yes, and a quicker cure.

5167. I suppose you admit, as another witness did, that the Privy Council adopted every regulation that they had power to adopt under the circumstances to protect the town, that, although they were a long time in consequence of their machinery not being sufficient in getting rid of the animals, the place was declared an infected place, and all egress from it and ingress to it were stopped?—Yes.

5168. And, therefore, everything was done by the Privy Council, supposing the boiling process to be the one they sanctioned, which could be done under the circumstances?—I believe that so far as the Privy Council was concerned it did do so; but the city authorities would not allow the other boiling-houses to be used. I am only speaking now from hearsay; there are three or four boiling-houses, and they did not use them.

5169. You know, as a fact, that there being on the spot three or four boiling-down houses, only one was used?—Only one boiling-house was used.

5170. And the process, in consequence, was so slow that it took from Thursday to the following Wednesday, before all the bodies were disposed of?—That is so.

5171. And you represent that that is one danger which we might get over by adopting regulations more in accordance with those which are adopted in Germany?—I do.

5172. With regard to foot-and-mouth disease and pleuro-pneumonia, we have had a great deal of evidence given to us, the object of which is to attempt in this country to stamp out those diseases; have you, from your long experience of the trade, and from your knowledge of these diseases, formed any opinion upon that possibility?—In my opinion, it is impossible to stamp them out.

5173. Can you give the Committee any reason to strengthen that opinion?—I can only repeat my former evidence. I used to breed cattle and graze cattle in this country; foot-and-mouth disease broke out on my farm without my being able to give any reason or cause for it; and I have had young bulls which I reared, pedigree stock, taken with lung disease, and I could give no reason for it, because I had introduced no other stock among them.

Chairman—continued.

5174. Was there any outbreak of these diseases at the time in your neighbourhood?—I will not say that there was not any in my neighbourhood, but certainly not within some miles, because people in my neighbourhood did not keep cattle; most of the land adjoining my farm is used for haymaking.

5175. It was grass land round you?—Yes.

5176. Did you satisfy yourself that it could not have been introduced in the way that people have suggested that it is possible to carry foot and-mouth disease by dogs, or hares, or rabbits, or other animals coming across from the ground that was in infected into your own pasture?—I could not prove that that was the case, and I have no reason to believe that it was so.

5177. The impression that was left on your own mind was that these outbreaks were spontaneous rather than that they were produced by contact?—That has always been my impression.

5178. I suppose you would use that argument to show that even if you succeeded for a time in stamping out foot-and-mouth disease, yet under the conditions of this climate it would always break out again?—I believe it would. I have a statement here in the "Field" of this very week with regard to the outbreak of pleuro-pneumonia in Cornwall, which is stated to be believed to have come from Ireland.

5179. Is that a newspaper extract?—Yes, it is from the "Field" of the 9th June 1877.

5180. Is this statement signed by anybody?—No it is merely announced that pleuro-pneumonia has appeared in several places in Cornwall.

Sir *George Jenkinson.*

5181. It is at a place called Helstone, in Cornwall, is it not?—It is.

Chairman.

5182. With regard to pleuro-pneumonia and foot-and-mouth disease I understand you to say that you believe that no restrictions which we could put upon the home trade would stamp them out; and I suppose you would infer that it would be useless for us to place any additional restrictions and regulations upon foreign import on account of these diseases?—Certainly.

5183. In addition to the fact that we have it in our own country, we have very strong regulations at present as against the introduction of the disease from abroad?—Yes, they are not allowed to leave the place alive.

5184. That applies also to the whole cargo that comes over, even though it is supposed to be sound?—Yes; if one single animal is declared by the inspector to have either pleuro-pneumonia, foot-and-mouth disease, sheep-scab, or any disease the whole cargo is slaughtered at the place of landing.

5185. On that you formed your idea that our regulations, strengthened as you suggest they might be, by telegraphic communication, and the stricter regulation to be adopted abroad, are sufficient for our protection as against the foreign import, without taking the measure of stopping that trade?—That is my opinion.

5186. Have you considered this American meat question which has been introduced to this Committee?—Yes, I have heard a good deal of the evidence.

5187. You have examined, I suppose, the history of the introduction of this meat?—Yes.

Mr. *Gebhardt.*

25 June 1877.

Chairman—continued.

5188. What opinion have you formed with regard to the statements that you have heard about it?—I have heard various statements, and I think it is a very difficult matter to give a clear opinion about; I have seen American meat, and certainly some of it arrives in very good condition, and is of excellent quality, there can be no doubt about that; but I have seen other meat in a very bad state, and in fact not fit for human food, which would not be allowed to be sold in a public market, in the Metropolitan Meat Market, for instance; but which is taken outside to some shops where I believe the city authorities have no power to seize it, and that has been sold, as I have seen myself, as at low as 1 *s.* a stone or 1½ *d.* a pound. This was good meat, but in a nasty smelling state, and when I asked the butcher what could be done with this meat, "Oh," he said, "it all goes in sausages."

5189. Have you had it brought to your knowledge whether, what a witness stated to us was the case, viz., that with regard to much of that meat which is selling cheaply, after trimming it a considerable portion of it is very sound and good still?—If you cut all the outside off, which, of course, looked a black and nasty colour and has a nasty smell; I should very likely believe, and in fact I know, that a lot of this meat is consumed, and is bought by the butchers at a great deal less money than other meat; but still it leaves an enormous profit to the man who sells it. A great many people buy it, and do not know what they buy, because when a man goes and buys meat for 1½ *d.* per lb. of course he can sell it at almost any price to get a profit; but a lot of it is seized as being unfit for human food.

5190. That I understand to have amounted to a considerable quantity in the last fortnight?—Three great waggon loads of American meat have gone down this morning to Deptford to be boiled down, and the smell when they boil it down is so bad that it almost drives us out of the market. That has been lately an every day occurrence.

5191. I think you were in the room when a witness gave evidence that the reason why this bad meat was in the London market was, that it was meat which had not been sold in Liverpool which had been sent to London, and which had not arrived in this country in as good a condition as it ought to have done from the failure of their material, or from their attempt to pack it too closely; has that been brought to your notice?—It appears to me that whenever they have small consignments in a steamer the meat comes in fair condition. I have not seen the process on the steamer myself; I am only stating what is my opinion. When they send larger lots in one steamer then a great deal of this meat comes in bad condition; and I myself fancy that it is because there is not sufficient room for the ice, or because the cold air cannot get to it, that part of it arrives in bad condition and part arrives in good condition. I think that the greater part of the bad meat has arrived not in the hot weather, but before it was very hot.

5192. I suppose you would admit that a large proportion of it in the country (perhaps not so much of it in London) has arrived in very good condition?—Yes, I believe so.

5193. That being the case, would not the very fact of that loss tend to induce the sender to increase his care, so as to send it all over in a condition that would pay?—Yes, I believe he will do so; but then, of course, the expense will be greater, because if he puts a certain lot of meat in a certain space, and he can double the quantity in that certain space, it costs so much less money, because I believe they go by measurement.

Chairman—continued.

5194. The importer of it stated here that a cargo coming over in good condition and selling at 6 *d.* or 6½ *d.* per lb. paid?—So I understand.

5195. Under these circumstances, after they have tried all their experiments, and found that they lose by those experiments, would not the result be that it would settle down into a fixed trade, by which we should secure the meat in the best condition, and they would get their 6 *d.* per pound, which they say pays them?—If the meat pays here at 6 *d.* per pound, and they can bring it over without additional expense, it might answer their purpose; but supposing that the expense was larger, then it might be a question as to whether it would pay. I am not for a moment saying that they cannot bring the American meat over in good condition, because if they bring it over sometimes in good condition they can bring it always in good condition.

5196. Therefore naturally it may be supposed that these experiments will result in their adopting a system which will secure them a good profit when the meat comes over to this country?—One would suppose so.

5197. From the fact of its having gone on now since October 1875, and having steadily increased notwithstanding the losses that have taken place, the probability is that that will be the ultimate result of these experiments?—Very likely.

5198. Do you consider that the importation of dead meat is likely to bring disease with it?—I could hardly give an opinion upon it, but I should fancy that they can send diseased meat without its being detected.

5199. You would represent that diseased meat would come over in the dead-meat trade without being discovered?—Yes.

5200. Of course, if it was unfit for food, it would be detected, but if it was not, you cannot give any idea whether that would be likely to spread disease?—I should fancy from what I have heard of cattle plague that it might spread it, but I do not believe it would spread pleuro-pneumonia or foot-and-mouth disease; that is, of course, out of the question.

5201. But with cattle plague there might be that danger, though a small danger?—I am not prepared to say, because they have carried the idea of infection in Germany to almost any extent. They believe that anything which has been in contact with cattle plague is able to carry it.

5202. However, dealing with this American dead-meat trade, do you believe, having watched the conditions under which that trade is now carried out, and admitting the possibility of its being made a permanent trade at the price they state, that you could establish a dead-meat trade of that kind with the Continent?—No, never.

5203. Can you give your reasons to the Committee for that statement?—The first reason would be that the supply of ice in America is unlimited, whilst at certain places on the Continent they have no ice. They must then get ice at an expense from some other place, and the additional expense, I believe, would never pay them to do it.

Chairman—continued.

5204. On that point of ice the last witness stated, and, I daresay, you are aware of the fact, that ice can be manufactured where you have not got it?—It is not done yet to a great extent.

5205. That might obviate that difficulty, might it not, supposing that it was possible?—Yes; but must we not wait until we have got it?

5206. I understood the last witness to say that it was a sufficiently ascertained fact to make it a certainty, if it was thought worth while to adopt it?—It appears to me that whether you have natural ice or whether you have manufactured ice, it is a matter of expense. If it will pay the foreigner to go to the expense, he will do it, but if it will not pay he will not do it, as in any other trade.

5207. Apart from the difficulty with regard to ice, which might be got over by invention, what are your reasons for saying that it would not pay to export dead meat from the Continent?—If it pays the American to send meat here at 6 *d.* per lb., I am certain that you would get very little meat from the Continent, because it is worth more money there.

5208. You believe that the foreign animal would find a better market than the English market, if the price was restricted to the price which is shown to afford the profit required on the American meat?—That is my opinion.

5209. Supposing that 6 *d.* per lb. was all that he could get, you do not think that the foreign farmer would undertake a dead-meat trade to England whilst he had the live-stock trade to other places open to him?—Quite so.

5210. What countries would he take his live stock to in preference to bringing it as dead meat to this country?—We must take every country seriatim. You have had evidence from Denmark that if they cannot bring cattle here at a remunerative price, they would fall back on dairy produce. When we consider that this foreign cattle trade is only 35 years old, you may expect that what the people did before, they will do again. There are several ways in which a farmer may employ his land, either for breeding cattle or for dairy purposes, or for growing corn; but you must also understand that at present the demand for meat is increasing very largely on the Continent, and that France is a great competitor with England, and takes a great deal of live stock.

5211. Therefore you believe that, supposing the import trade in live animals was prohibited, it would practically drive the foreigner to France for his market, whilst a great number of people like the farmers in Denmark would turn their attention to other methods of farming?—Yes.

5212. And that in that case we should not get a dead-meat trade substituted for the live stock supply?—No. Since the late outbreak of cattle plague, Germany has closed all its frontiers to Russia and Austria, so that in Germany proper now (excluding Schleswig-Holstein), meat is dearer than it is here. Consequently, if they kept to this rule to exclude Austrian and Russian beasts, they would require all their own, and a large supply from Schleswig-Holstein as well, in the summer; because Germany proper is divided in this way: Schleswig-Holstein produces grass cattle, and the other parts of Germany principally stall-fed cattle, and they mostly require an addition from Schleswig-Holstein to their own cattle.

Chairman—continued.

5213. I suppose that the amount of cattle from Germany proper is not so important a supply as the sheep that come from that country?—No; the supply of German cattle has been reduced very much lately.

5214. Have you any figures with regard to the importation of sheep, showing what the supply is from Germany?—I have only the statement for the last five months of last year, when the grass season commences on the 1st of July to the last of November. This is the whole foreign import. I have no other statistics from Germany separately, but I put them together to show what the import of foreign animals into London is, as compared to English animals. From the 1st of July to the 30th of November the import of foreign sheep into London has been 394,440 sold in the Islington Market. I am only speaking now of London, During the same time the English sheep sold in that market were 320,500, so that in those five months there were 73,940 more foreign sheep than English sheep sold in London.

5215. I suppose that a very large proportion of those sheep are taken through London for consumption in the large towns in the country?—Yes; they go a great many miles round London, I should say as far as 200 miles, into the manufacturing and mining districts. Now during the same time the foreign beasts sold in Islington Market were 75,430, and the English beasts sold during the same time in the Islington Market were 77,150; so that 1,720 more English beasts were sold in those five months in the Islington Market than foreign beasts. There were more English beasts sold and more foreign sheep sold.

5216. A larger proportion of foreign sheep were sold in the markets, and a larger proportion of home cattle?—That is so.

5217. Can you state how that return has been made up?—From the "Times" newspaper, which gives the return of the markets.

5218. Those figures are taken, I understand, from the official market returns which appear in the "Times"?—They are.

5219. I understand you to mean that it is not official, because it is not from the Government, but that it is a return issued by the market authority?—The clerk of the markets reports to the "Times."

5220. And it appears weekly in the "Times"?—Yes, that is from the 1st of July 1876, to the 30th of November 1876.

5221. During what you have described as the grass time?—Yes, the five grass months.

5222. Have you got the figures relating to the next six months?—I have not; because this is the principal season in which we rely upon the Schleswig-Holstein cattle. During the other season we get no Schleswig-Holstein cattle.

5223. You mean that that gives the fairest criterion of the stock imported from abroad?—Yes; I believe when we should want the foreign stock most in those five months, which are of course principally in hot weather, the importation of foreign cattle is the largest. Our sheep importation in the first six months of the year is very large; I myself sold this year, in five months, from the 1st of January to the 14th of June, 85,926 foreign sheep.

5224. And what was the number?—Very few of cattle, because they have been prohibited from

Mr. *Gebhardt.*

15 June 1877.

Chairman—continued.

Germany, and only Danish, Swedish, and Spanish cattle have been allowed; and that has all been in favour of the American meat, because the supply of foreign cattle fell off.

5225. Has there been any perceptible diminution of the supply of sheep since those regulations and restrictions were imposed in consequence of the cattle plague?—The diminution did not take place so long as France kept her frontier closed. When the cattle plague broke out in Germany, as France and Germany join, they prevented the importation of sheep altogether, and consequently a great many sheep came to this country, even under the restriction of being killed at Deptford; but some time ago (I forget now the date), when France opened her frontier again, then our supply fell off about one-half every week.

5226. The supply diminished as soon as the market opened in France?—Yes.

5227. And the foreigners preferred sending their sheep to other markets to having them killed at Deptford?—Yes, and the price regulated it. It is stated as a fact that the same day when sheep were sold at Deptford at 33 *s.*, sheep made 38 *s.* in Paris. A man divided his sheep, and sent a part of them to Paris and a part of them here, and the sheep which he sent to Paris made 5 *s.* more than those which he sent here.

5228. From what reason did that difference arise?—There are lots of causes to operate against the Deptford Market. First of all, as I stated before, a great many of the foreign beasts and the foreign sheep, when they can go to the Islington Market, are allowed to go into the country, and they go, I should say, within a distance of 100 or 200 miles. A great many sheep are sold in this market to go to Liverpool, and a great many to Birmingham and as far as Plymouth; and taking the South Coast round, I should think there is not a place where they do not go to. Then in the mining districts of Wales they consume foreign mutton almost entirely, because it suits the trade. I am talking not of the Holstein sheep, but of the Merino sheep which arrive at this time of the year. Their average weight is about six stone, or 48 lbs., whilst English sheep, of course, are a great deal heavier. Then our foreign sheep are sold for less money; if we stand at the same market at Islington we never make so much for them, excepting for some extraordinarily fine Schleswig-Holstein sheep. We always make from 1½ *d.* to 2 *d.* per pound less for foreign sheep than for English sheep. A great many of those go all over the country, particularly, as I said before, to Manchester, Birmingham, Liverpool, Wales, West Bromwich, and places round the South Coast. You have not got those buyers about Deptford; you have not got the small butchers there; we are in the hands of a few large buyers. If the supply is very short, we can sell pretty freely; but if the supply is strong, we may sometimes sacrifice them for very bad prices, because there is no competition.

5229. And that tends, of course, to diminish the export?—If the sender can get a better price in Paris than in London, then he goes to Paris.

5230. On that ground you object to the restrictions which compel the slaughter of the sheep at Deptford?—I think that it is totally useless, because we are not allowed to introduce a sheep with disease. After the sheep have been 12 hours in quarantine, they are every one singly turned over on their backs and examined, and then they are allowed to go away, and they are taken to the market.

Chairman—continued.

5231. I understood you to say just now that the supply had fallen off very seriously as soon as France opened her boundaries?—Yes.

5232. Has the price to the consumer gone up in consequence?—The price is so irregular at Deptford, that when the regulations were taken off in France, I think, the price in one week by the diminished supply rose 6 *s.* per head at Deptford, which would, of course, be 1½ *d.* per pound upon a sheep of 48 lbs.

5233. That has been a distinct rise to the consumer?—Yes; and then the next week, perhaps, we may have a bad meat market. Our meat market regulates the live trade; and lately, when there has been such a glut of American meat in the market, we have been obliged to sell our sheep lower as well. The fact is, that the Deptford Market is a very irregular trade; it varies much more than the other markets.

5234. And that irregularity, as you say, stops the sending of the animals to this country?—Yes; because a man does not know, when he sends his things away, what he may get for them.

5235. I suppose that sheep are allowed not to be so liable to introduce disease into the country as cattle are?—I believe not.

5236. Therefore, in your opinion, there is not the same necessity for slaughtering sheep at the port of arrival?—There is not.

5237. Supposing that the import of live animals were stopped, do you believe that what has been stated would be the case, viz., that the home supplies would increase so largely as to fill up the gap?—If they could make England larger they would increase, but I do not know whether they could find the land to put them upon.

5238. Do you say that the land is now stocked up to its full carrying power?—I believe it is, because if it does not pay a farmer to breed cattle when either mutton or beef fetches in the market such a price as it does now, I do not know what would induce him to breed.

5239. Therefore you do not, from your practical knowledge as a farmer, think that the security would induce him to breed more extensively than he does at present, because you believe that the grazing power of the country is fully taxed?—That is my opinion.

5240. I suppose that you object to this idea of stopping the import of live animals, on the ground that it is a direct attack upon the free-trade principle which has been established, and which is gradully spreading as between countries?—Yes.

5241. With regard to a question which we had before us, and on which we had a good deal of evidence before the Committee of 1873, and which has also been mentioned here several times, viz., the importation of offal; it was stated that a large number of people, in this town especially, depended very much upon that supply; have you at all considered the question since you gave your evidence before the Committee of 1873?—Yes, I have had before me everyday experience of that.

5242. Supposing that the animal was brought over here as meat killed, would you be able to bring the offal under the same conditions?—Certainly

Chairman—continued.

tainly not. It has been tried, and it has always failed. I am not an importer, but I have seen it tried, and it has failed.

5243. Do you think it would be possible to bring it under the conditions under which they are now treating the American meat?—It appears to me that it cannot be done, because the Americans do not do it; they have tried it.

5244. I understood the American witness to say that they do not do it, because they find a market for every part of the offal in their own country; but from a country like Schleswig-Holstein, where they state to us that there is no market for offal, from the population being very sparse, would it be possible, under the conditions of the refrigerating process, to bring the offal over here in a saleable condition?—I am positive that it cannot be done, because anybody who has any practical knowledge of this subject, knows that if, in warm weather, offal (by which I mean the liver, the heart, and the head) is not consumed the next day almost it spoils, because the fact of there being blood and things attaching to it soon decays it. It is always a great object with the butcher to dispose of his offal for consumption as soon as he can.

5245. We had one witness called before the Committee of 1873, who had a different opinion from your own with regard to this matter, and Professor Brown has stated here that he believes that a certain quantity of offal is brought from abroad at the present moment for sale in this country, and I think he said that some of it came from Vienna; and the witness before the Committee of 1873, Mr. Robinson, stated that he knew that offal could be imported from abroad in a condition in which it was saleable in this country; you differ from them?—As regards Professor Brown's statement, when he was asked the question whether he had any proof (because I told Mr. Norwood, the Member for Hull, about it), he said that he had no proof, but that he only heard so. As regards what Mr. Robinson said, I do not care; my experience is quite as good as his. I know that it has been tried, and it cannot be done; it has not succeeded, and it never will succeed, and the offal question is a very great question for the poor.

5246. You state that it is not practicable to bring offal over into this country, and to sell it in competition with fresh-killed offal?—I do not believe that it is possible to establish a trade in it.

5247. Even under the refrigerating system by which the meat is brought over sound to this country?—I believe it is impossible.

Chairman—continued.

5248. Do you think that the trade would be as easily regulated as it is at the present moment, if it was all a dead-meat trade?—I believe that if you made all the foreign meat come dead to this market, and American meat should continue to come, the one would spoil the other; there would be a lot of meat in London which could not be consumed. If it did not pay people to send it, they would leave off sending it, and in the country, where they really wanted the meat, they could not get it.

5249. Would it not regulate itself?—I think not. If it does not pay a man to send goods to a country, he will not send them.

5250. We have heard that the American meat can be kept for any given time in the atmosphere in which it is brought over; would you not be able to regulate the trade, as against a glut of the market in that way, by maintaining the meat in the temperature in which it is brought over until it is wanted in the market?—Yes; but if the Americans can do it, why do they not do it? As I tell you this morning, three waggon-loads of meat have gone to be boiled down at Deptford. If a man knows how to protect his goods, it is very odd that he does not do it.

5251. You do not think that that may be merely the result, as the witnesses have said, of these experiments before a settled trade has been established, and that this result would not occur when the system of bringing over the meat had been once matured?—Of course I am not able to say what they might do, but at present they have failed greatly in many respects.

5252. Do you think that the supply of this American meat, as Mr. Lyons, a London butcher, stated, has been a great relief to the London market lately?—I believe it has; I do not know what the price of meat would have been if it had not been for the American beef. I think it would have been very high, considering that we lost all the Continental supply through cattle-plague.

5253. And prices have been kept down by the fact of the American supply having taken the place of the foreign import?—That is so.

5254. That being so, if the American supply was a permanent trade, it would make the foreign import rather less important, would it not?—Yes; if the Americans can supply you with sound meat for 6*d.* per pound, I believe the foreign trade would be reduced very soon, particularly if you did not let the cattle go free into the country.

5255. That you think might be left to the natural competition of the trade?—Yes.

Monday, 18th June 1877.

Mr. Ritchie.
Sir Henry Selwin-Ibbetson.
Mr. Torr.

SIR HENRY SELWIN-IBBETSON, BART., IN THE CHAIR.

The Right Honourable FRANCIS WILLIAM, Baron FITZHARDINGE, attending by permission of the House of Lords; Examined.

Right Hon. Baron *Fitzhardinge.*

18 June 1877.

Chairman.

5256. I BELIEVE that your Lordship has taken some interest in the question of the introduction of cattle from Ireland?—Yes, more particularly with regard to the counties of Gloucester and Bristol.

5257. Can you speak with regard to the present conditions of the trade in which those cattle are brought upon the market in Bristol?—We have not allowed any Irish cattle to come into the county of Gloucester for the last two months.

5258. The Irish cattle have been prohibited?—Yes.

5259. Have any Irish cattle been brought in notwithstanding that prohibition?—Not to my knowledge.

5260. Are there any Government inspectors at each of the ports?—There are none for Gloucestershire that I can find; there are two for Bristol, but Bristol cattle are landed in Somersetshire, and the Bristol cattle market is also in Somersetshire.

5261. Your Lordship means that because in Gloucestershire the regulations are not adopted that are adopted in other counties, cattle are landed there, notwithstanding the stoppage of trade on the part of the authorities of your county?—They are landed at numerous places where there is no inspector at all. On the 26th of February I was in company with my farm agent, and we met 97 head of Irish cattle about 20 miles from Bristol. We stopped them, and asked the men with them where they were going to, and where they came from. We were told that they came from Cork, and arrived at Bristol early in the morning; they could have landed at the docks at Avon-mouth, but they did not; they came 20 miles up the river. They were consigned inland to a place called Purton, and they came from Sharpness Point, and had to go back a distance of 20 miles to Bristol. They came right through my land.

Chairman—continued.

5262. Through a district where import was prohibited?—Not at that time; but in consequence of these cattle having been smuggled into the county, and taken back there again, the owners of stock took the question up, and asked me to bring this matter before the court of quarter sessions, with a view of stopping the importation of Irish cattle into the county.

5263. That was the origin of the regulation prohibiting the entry of Irish cattle for the last two months?—Yes.

5264. Was the object of their landing there before you discovered them, instead of landing at the port for Bristol, the desire to evade inspection?—That is the common opinion.

5265. The inspectors are at Bristol?—There are two Government inspectors at Bristol; they inspect the cattle, but they have nothing to do with the sheep or pigs. The local inspector does not inspect the pigs, but he meets them on the following day in the market, and if he can detect a diseased sheep, or a diseased pig in the market, he brings the matter before the magistrates; if he proves his case, the man is fined, and the inspector gets half the fine, and that is how he is paid.

5266. The local inspector is paid a premium on detection?—That is so.

5267. And the Government inspector has nothing to do with that?—The two Government inspectors have nothing to do with either sheep or pigs.

5268. But they have authority over the introduction of cattle?—Yes.

5269. What regulations would your Lordship represent to this Committee ought to be adopted with a view of doing away with such evasions of the regulations as that which you have described?—At Bristol the whole ought to be under the Government. For instance, there is nobody at New Docks, Avon-mouth, to inspect cattle or sheep; there

Chairman—continued.

there ought to be a recognised inspector. They have frequently landed cattle on the bank of the river at Aust about 10 miles from Bristol and at other places; and they bring them up the canal a distance of 14 or 15 miles through a dairy district, and land them three miles short of Gloucester, at Quedgley, where there is no inspector, and then they are driven into the market at Gloucester.

5270. In fact, you would suggest that the places where they could land cattle from Ireland should be all defined, and that inspectors should be appointed by the Government, who should have the inspection of those cattle on landing at those ports?—Yes, in the case of cattle, and also sheep and pigs.

5271. Do you attribute any outbreaks of pleuro-pneumonia or foot-and-mouth disease to the laxity of the regulations at the present moment?—When foot-and-mouth disease breaks out it always works from Bristol and then up eastward.

5272. It works along the line of the driving of these Irish cattle?—Yes, just so.

5273. I suppose that all this district is a dairy district?—It is.

5274. And therefore it is very liable to suffer from the passage of diseased animals?—It is. Up to Gloucester it is all a dairy district.

5275. At present the inspection is simply at Bristol, and not at the port where the cattle may be landed for the Bristol market?—It is simply at Bristol. There is a new dock just opened at Avon-mouth, but there is no inspector there.

5276. And therefore any cattle from Ireland that were inspected would not go to Bristol where they would be inspected on landing, but to other places at which they would not be inspected, and from which they are distributed throughout the county?—That is so.

5277. Has your Lordship at all considered the question of the attempt which has been suggested by certain witnesses to stamp out pleuro-pneumonia and foot-and-mouth disease in this country; my question is with a view of ascertaining whether the farmers in your neighbourhood, in your opinion, would be willing to submit to regulations for that object?—They would be perfectly willing.

5278. Even if those regulations were so strict as to close the markets and fairs for a considerable time, or to place restrictions upon the movement of cattle with the object of doing away with foot-and-mouth disease?—Even then, I am sure they would not object.

5279. And your Lordship would say that the regulations that applied to England, either for checking the movement of cattle or for restricting markets, should apply equally to Ireland as part of the United Kingdom, and as being a place upon which we depend very much for stock, and from which we are liable to receive disease?—We are not only liable to receive disease, but some sheep came into Bristol last Wednesday with foot-and-mouth disease, and there were some pigs that came into Bristol one month ago which had it.

5280. Witnesses before this Committee have made a great distinction as between stamping out pleuro-pneumonia and stamping out foot-and-mouth disease; do you believe that the farmers would be willing to submit to regulations for doing away with foot-and-mouth disease as well as pleuro-pneumonia?—I do. As long as they

Chairman—continued.

can escape the disease, they are willing to put up with anything.

5281. It was stated before the Committee of 1873, and it has also been stated by witnesses here, that although they would be willing to put up with restrictions to stamp out pleuro-pneumonia, believing that that could be stamped out, yet that foot-and-mouth disease is not so dangerous a complaint, that they do not lose the same proportion of their cattle from it, and that therefore the regulations which would be necessary to stamp it out might be too severe; do you agree with those witnesses?—The farmers are getting very shy of buying pigs. There is a great trade amongst the farmers in our country in fattening pigs. For instance, a tenant of mine next door to me is a great man for pigs, but he will not buy a pig now simply because he is afraid to go into the Bristol or Gloucester market, because he thinks that then he would have his cattle affected with foot-and-mouth disease.

5282. You think that pigs carry foot-and-mouth disease?—There is no doubt about it.

5283. Are those Irish or English pigs?—Both, Irish or English pigs.

5284. In fact, they hesitate now in buying any stock of pigs for their farms?—They do.

5285. But I understand you to speak principally with regard to the restrictions which you think ought to be imposed as to the landing of Irish cattle for the protection of the farmer against pleuro-pneumonia and foot-and-mouth disease?—Quite so.

5286. Is there any other point upon which your Lordship wishes to speak?—I think not.

Colonel *Kingscote.*

5287. The district which you have mentioned lying between Gloucester and Bristol is essentially a dairy district, is it not?—It is nothing but a dairy district.

5288. And from your own knowledge, very heavy losses have been sustained by farmers in that district, from foot-and-mouth disease spreading into Wiltshire?—Yes, and if they get it again, half the farmers in the county will be broken.

5289. Are you aware that this is the difference between the local inspectors and the Government inspectors; that the Government inspector can only stop cattle which are diseased, but cannot stop sheep and pigs; but that the local inspector can stop anything coming from on board ship if he finds it to be suffering from disease?—The local inspector is not there; he is in the market; he does not meet them on landing.

5290. But he could do so, could he not?—I think not. Two Government inspectors meet the cattle; the local inspector goes into the market the following day. The cattle land there on the Wednesday, and the market is on the Thursday.

5291. If the local inspector finds disease and prosecutes a man, he gets half the fine, does he not?—He gets half the fine.

Chairman.

5292. That is after the cattle are in the market?—Yes.

Colonel *Kingscote.*

5293. Does that apply to cattle, sheep, or pigs?—It applies to cattle, sheep, or pigs. After

Right Hon. Baron *Fitzhardinge.*

18 June 1877.

Colonel *Kingscote*—continued.

they are in the market, if they are diseased, he prosecutes the man, and on conviction he gets half the fine, whatever it may be.

5294. From those with whom you have been in communication, you know that there have been cases of foot-and-mouth disease both among sheep and pigs in the British market within the last month?—I cannot say that there have been in the Bristol market, but sheep which were landed last Wednesday were in a fearful state. There were some pigs landed in the last Wednesday in May which were in a very bad state; but whether they were taken into the market or not I cannot say; they came from the same ship as the cattle did.

5295. And they were landed with foot-and-mouth disease?—They were landed with foot-and-mouth disease.

Mr. *Anderson.*

5296. Does your Lordship mean that this was a wilful and deliberate importation of diseased cattle by parties who brought them in, knowing them to be diseased?—I should be sorry to say that, but disease may break out during the passage.

5297. But they took a roundabout way of getting to Bristol market, which must be much more expensive and troublesome to them; what do you suppose was the object of that?—I cannot tell the reason for that, more than that they came up the River Severn 20 miles, and they were driven back to a fair 20 miles away through a dairy district.

5298. That is a more expensive way of getting them to market, is it not?—I could not say that. I have heard it reported that when those cattle were landed the man saved 15 *l.* by the job.

5299. Was that by his escaping the dues?—He would have to pay the dock dues at Sharpness Point.

5300. Then how would he save the money?—In the vessel in which they came, the "Henry Allen," these 97 head of cattle were carried as a deck-cargo. She is not properly constructed to convey beasts, though she very often conveys them; but she is not properly fitted up for cattle.

5301. Then do you suppose that the disease broke out in consequence of these mal-arrangements for carrying the animals, or that they were delivered to the ship in a bad state?—I do not think that those cattle were shipped in a bad state.

5302. You think, therefore, that it is owing to the mal-arrangements for the trade on board the ship that disease breaks out on the way?—There is no inspector at Gloucester, and nobody knows whether a vessel is disinfected on arriving, after the cattle are landed.

5303. We have had evidence here that the traffic from Ireland to Glasgow was also conducted in such a way that foot-and-mouth disease broke out on board the ship, so that your Lordship's evidence very much strengthens the supposition that mal-arrangements for the traffic tend to promote disease on board the ship?—I should think so.

5304. Then there are no sufficient arrangements of inspection at the ports to prevent these mal-arrangements?—There is no inspector at all in several of the ports.

Sir *George Jenkinson.*

5305. I think that the chief point of your Lordship's evidence is in the direction of showing the great want of proper inspection, is it not?—There is no inspection at all on landing, except in the case of cattle.

5306. In point of fact, is it your opinion that the whole of the arrangements as to inspectors, at all events, in so large a port as Bristol, ought to be under the orders of the central government?—Certainly; it is not only at Bristol, but at Gloucester too, and at Sharpness Point.

5307. The whole of the district?—Yes.

5308. You know as a fact, do you not, that at least one large cargo of animals has passed from 20 to 30 miles up the Severn, and has come back by road past my place, and gone that way to Bristol, thus evading detection altogether?—I saw them myself, and made inquiries of the sergeant of police, and the pilot who had charge of the vessel.

5309. And it is possible to land at a great many places where there is no inspection whatever?—They may land at New Passage; they have landed frequently at Aust; it is possible for them to land at Oldbury; they have landed at Lydney, and, in fact, at almost any point between Gloucester and Sharpness Point, a distance of 16 miles; and they have frequently landed at Quedgley, within three miles of Gloucester.

5310. So that, in point of fact, unless the Government takes in hand the proper supervision of landing of cattle in the whole of that district, the present means of inspection is a perfect farce?—It is a perfect farce.

5311. And any amount of disease from Ireland or elsewhere can be introduced into that dairy district, under the present arrangement, without any check whatever?—That is so.

5312. Is it not a fact that if any cargoes should come from any other place excepting Ireland, they can be landed?—They can be smuggled into the country at many points without any inspection.

5313. There is nothing to stop anything coming in?—Not that I am aware of; they can land them on the banks of the river.

5314. With regard to more stringent arrangements issuing from the central authority, do you agree with a former witness (I think it was Professor Brown), who stated that it was of no use to make more stringent regulations, because the farmers would not stand them?—The farmers in our part of the world would be only too delighted to have more stringent regulations.

5315. Then I take it that you think that any witness who stated that, could not have had the authority of the general body of farmers?—Anybody who said that must have been ignorant of the dairy farmers of the county of Gloucester.

5316. Have you lately sent any person to see the landing of diseased cattle at Bristol?—I have sent my farm steward.

5317. Are any of those persons available as witnesses?—There is one in the room at present.

5318. Is either of the inspectors from Bristol available?—They are not here.

Mr. *W. E. Forster.*

5319. You said in answer to a question which was put to you by the honourable Baronet, the member for North Wilts, that cattle could come in

Right Hon. Baron *Fitzhardinge.*

18 June 1877.

Mr. *W. E. Forster*—continued.

in from Ireland or elsewhere; I suppose your objection is to the Irish cattle, and sheep, and pigs?—It is with regard to Irish cattle; we do not have any foreign cattle that way; they come from Southampton to Bristol market.

5320. You are aware, I suppose, that, according to the law, cattle from the Continent can only be landed at certain points, where they must be inspected?—Yes.

5321. And that if they come in at other ports, it must be by smuggling, with a great danger of the whole cargo being forfeited, and other punishments being incurred?—Yes.

5322. In the case of that cargo in which you said there was a large number of sheep with foot-and-mouth disease, what was the size of that cargo altogether?—About 2,300 head.

5323. Were they all sheep?—No, it was a mixed cargo of cattle, sheep, and pigs.

5324. I suppose they were chiefly sheep?—I was not present, but my agent saw them.

5325. Did your agent inform you that it was the sheep that had the foot-and-mouth disease?—The sheep and pigs; he is here, and he will be able to give evidence.

5326. I suppose that there was no attempt made either to slaughter or to isolate the cattle and the sheep that had been in contact with the animals that had had the disease?—The pigs were put into a cart and conveyed away somewhere; where I do not exactly know.

5327. You say that you have prohibited the import of Irish beasts into Gloucestershire?—Yes.

5328. When was that done?—I think it was on the 20th of March at quarter sessions.

5329. That, I suppose, was done under the permissive powers given by the Cattle Plague Order?—I was asked by the farmers to bring the matter before the quarter sessions, and after discussion it was carried unanimously.

5330. But can you inform us whether the power which you had to issue that Order was not in consequence of the breaking out of cattle plague in London, and the permissive authority that was given to the different districts to pass strict regulations?—I am not aware.

5331. You do not know under what Order of the Privy Council you had the discretion to pass that regulation?—I do not.

5332. But you have passed an Order at your quarter sessions, prohibiting the import, I suppose, into the county of Gloucester, of any cattle from Ireland or from anywhere else?—Yes.

5333. Is yours the only county in that neighbourhood that has done that?—No; Worcestershire and Warwickshire, I think, have done the same.

Mr. *W. E. Forster*—continued.

5334. When that matter was under discussion at the Quarter Sessions, what you were considering were only pleuro-pneumonia and foot-and-mouth disease, I suppose; cattle plague did not come under your consideration?—No, we never had cattle plague there.

5335. Then it was from the necessity to guard against pleuro-pneumonia and foot-and-mouth disease, that you passed that Order?—That was it, and from the smuggling of cattle up the river and back again.

5336. The smuggling of cattle from Ireland, I suppose, you mean?—Yes.

5337. But it was from the fear of those two diseases, pleuro-pneumonia and foot-and-mouth disease, that you passed this strict Order?—That was the principal reason.

5338. What you suggest, I think, is that there should be an inspection for every cargo of cattle, or sheep, or pigs, that arrives in the country from Ireland?—Just so.

5339. You are aware, I suppose, of an Act that was passed last year, which requires the Irish Government to appoint inspectors at the port of departure?—Only generally.

5340. You are not aware, I suppose, that the Order of Council under which you had power to make the regulations which were made, prohibiting the import of cattle into Gloucestershire, has been revoked from the 30th instant, by an Order that was gazetted last Friday?—I understand that it is to come to an end.

5341. You were informed of the fact, that this Order which you have made prohibiting the import of cattle from Ireland, or elsewhere, must come to an end, because your powers, after the 30th instant, will cease?—I thought that our time expired to-morrow.

Chairman.

5342. It is your local time that you think expires?—Yes.

Sir *George Jenkinson.*

5343. Is it not a fact that there was a meeting of the local authority at Gloucester on Saturday last, with a view of revoking the Order which the Right honourable Gentleman alludes to?—I was not aware of it.

Chairman.

5344. I gather that your Lordship would suggest that whilst you are protected by inspection as against the importation of foreign cattle, yet, inasmuch as you suffer from the introduction of foot-and-mouth disease and pleuro-pneumonia from Ireland, certain ports should be assigned for their landing, and that those ports should be properly inspected?—Quite so.

Mr. JAMES PETERS, called in; and Examined.

Mr. *Peters.*

Chairman.

5345. I BELIEVE you are the Land Agent of Lord Fitzhardinge?—Yes.

5346. You have heard his Lordship's evidence?—I have.

5347. In that evidence he has spoken of certain cargoes being landed at Bristol affected with foot-and-mouth disease coming from Ireland; are you personally able to speak to that fact?—Yes, I have seen them.

Chairman—continued.

5348. You yourself were present on the landing of the cattle?—Yes, at Bristol.

5349. And they were affected with foot-and-mouth disease?—The pigs were.

5350. Were there any cattle in the same cargo?—There were lots of cattle, but they were not infected.

5351. They formed part of a cargo in which the

Mr. *Peters.*

18 June 1877.

Chairman—continued.

the sheep and pigs were affected with foot-and-mouth disease?—Yes, they were mixed.

5352. And those were taken direct into the market at Bristol?—They were landed the day before the market, on Wednesday, the 23rd of May.

5353. There was no inspection of those animals?—The two Government inspectors were there.

5354. And they had no authority to stop them?—They had no authority to stop them.

5355. And, consequently, although you were quite aware, and the Government inspectors were aware of the landing of those animals, they went forward into the market?—They drove them where they liked; they took them right away. There were about 4,000 head landed the day I was down of cattle, sheep, and pigs; all landed in the course of two hours, and taken right away.

5356. Do you mean that all those 4,000 were either affected with disease, or came out of the ship's cargo that had the disease on board?—The healthy animals were surrounded by the infected animals.

5357. Are you aware that the very fact of their being so driven along any road would be an infringement of the Act?—The infected animals were taken away in that case, but mixed along with the other animals; they were not able to walk.

5358. But still you say that those infected animals were mixed with the other animals that were allowed to circulate freely?—They were all landed and driven together; they were all in the same boat; over 2,000 head.

5359. Have you seen any of the cargoes that have been landed at those other ports that his Lordship spoke of?—I saw a cargo of cattle that was landed at Sharpness Point on the 26th or 27th of February.

5360. Were those affected with the disease?—I could not say that they were.

5361. But they were landed at Sharpness Point, and driven from there to the Bristol market?—Yes; about 20 miles.

5362. Instead of being landed at Avonmouth or Bristol?—Yes.

Mr. *Mundella.*

5363. You have no doubt at all that, of those 2,000 head of cattle, a certain proportion were affected with foot-and-mouth disease?—Not the cattle; the pigs were.

5364. You have no doubt about that?—I am quite sure about it; it was pointed out to me by the veterinary inspector; he drew my attention to it.

5365. And they agreed with you that they were affected with foot-and-mouth disease?—They drew my attention to it, and took me to the cases.

Sir *George Jenkinson.*

5366. I think you said that the Government inspector saw these diseased cattle as well as yourself?—Yes; and the only power that they have at present, they told me, is to report it to the local authorities and to the Government.

5367. Did they, in point of fact, take any steps?—They reported it to the town clerk of Bristol.

5368. What was the result?—I do not know.

5369. It has been pointed out by the Right honourable gentleman, the Member for Bradford, that in moving the cattle at all the Act has been broken?—They may remove them in a cart where they think proper.

5370. Was there no person there, either inspector, or local authority, or magistrate, to prevent the Act being broken?—No; there was no local authority at all; only the two Government inspectors.

Mr. *Anderson.*

5371. The cattle that were landed out of the river, you say, were not diseased?—I cannot say, I am sure; they looked very bad.

5372. Do you know the reason for landing them up the river, and driving them back to Bristol; is there any saving of expense?—They get their cattle up light, and all that sort of thing, and get them fresh, and drive them into farmers' fields going down the 20 miles, by which they get them into nice condition very often.

5373. They get them into the Bristol market in better condition that way than if they landed them at Bristol?—They get them rested on the road, and turn them into a farmer's field at night, and pay nothing.

5374. Do you know whether there is any saving in expense also?—I am not aware of that.

Colonel *Kingscote.*

5375. Did you go on board the boat yourself at Bristol from which any of the cattle, or sheep, or pigs were landed?—Yes; I was there the whole time when the ship arrived.

5376. Were they in a bad state?—Yes; the cattle were in a very bad state.

5377. Were they very crowded?—They were, indeed; 2,000 head came up the Avon in one of those boats; and you may expect that they were crowded in one vessel.

5378. How many vessels were there?—Four; one from Cork, two from Waterford, and one from Dublin.

5379. Do you know the number of cattle, sheep, and pigs in all four vessels?—I should think there were over 4,000 head altogether; but I could not say exactly.

5380. When you spoke to the Government inspector, was he on board or was he in the Bristol Market?—He was seeing the animals landed at the port.

5381. You spoke to him at the time?—Yes; I was speaking to him, and he drew my attention to some pigs which were affected with foot-and-mouth disease. There have been several more cargoes. Last Saturday week there were 12 sheep, the worst cases the inspector had seen with foot-and-mouth disease. They reported them to the local authority, the town clerk, and to the Government; they were driven away in carts along with the rest of the flock.

5382. You do not know where they were taken to?—Not to be certain.

5383. You do not know whether they were taken to be butchered or to be turned out?—They were not killed.

5384. As regards driving those cattle from Sharpness Point to Bristol, you have seen the cattle yourself, you say?—Yes.

5385. Do you know of your own knowledge that they very often do turn them into farmer's fields at night?—Yes; I know that on very good authority.

Mr. *Peters.*

18 June 1877.

Mr. *Arthur Peel.*

5386. You say that you have been on board the vessels when they have arrived at the port?—Yes.

5387. Did you notice whether any provisions were made for the proper treatment of the animals on board?—Not the least. Sometimes I have known as many as 30 animals die on the voyage over

5388. Have you any reason to suppose that any animals were thrown overboard during the passage?—No; I never heard that.

5389. It has been stated here in evidence that the state of the vessels was such as to be likely to induce foot-and-mouth disease; do you believe that statement to be correct?—I should think that the over-crowding was sufficient to cause any disease.

Chairman.

5390. I understood you to say that the inspector himself called your attention to the fact of those animals being affected?—Yes; the pigs.

5391. Was the inspector present when they carried them away in carts?—Yes; he said they were to be killed.

5392. Are you aware that the Government inspector, to carry out the Act, has all the powers of the local inspector?—I am informed that they have not the powers of the local inspectors.

5393. Who informed you so?—The inspector.

Chairman—continued.

5394. All that I understood you to say was, that the inspector called your attention to the fact that these animals had the foot-and-mouth disease developed on them, and that he was present when they were put into carts and carried away?—Yes.

5395. Can you remember whether you discussed the question of his having authority to stop them or not?—I did.

5396. And he told you that he had no authority to stop their being so carried?—Not in the least, any more than report it to the authorities and the Government.

5397. Was he the usual Government inspector at the port of Bristol?—Yes.

5398. Were both the inspectors present on that occasion?—The two inspectors were present.

5399. Both the Government inspectors?—The two Government inspectors.

5400. Would you tell me the name of the inspector who made that statement to you?—I can give you the name if I am at liberty to do so.

5401. Clearly; in fact you must do so?—It was Mr. May, the head inspector.

5402. What is the name of the other inspector?—Mr. Broad.

5403. Was that the cargo that you saw in February?—No, on the 23rd of May.

Mr. *Gebhardt.*

Mr. Herrman Gebhardt, re-called; and further Examined.

Chairman.

5404. Has your attention been called since our last meeting to a statement that has appeared in one of the journals throwing some little doubt upon the figures that you quoted with regard to the market?—Yes.

5405. Have you taken any steps to verify those figures?—I have here an official statement from the Metropolitan Cattle Market, and the figures are very nearly the same as mine; only they are, if anything, more favourable.

5406. Will you read out what the clerk of the market has given you as the official figures?—These are the figures from the 1st of July to the 30th of November 1876. The number of British beasts sold in the Islington Market was 76,715, and the number of foreign beasts sold in the same period in the same market, were 75,460. The number of British sheep sold in the same time was 316,140, and the number of foreign sheep was 395,940.

5407. There is a slight difference in the number of sheep that you now give as compared with the figures that you gave us the other day, but still the number of foreign sheep is very much larger than of the home supply?—Yes, the clerk of the market makes it 4,316 English sheep fewer than I made, and he makes it 1,500 more foreign sheep than I made. He makes it 435 English beasts fewer than I made, and 30 foreign beasts more; so that the difference is not very great altogether.

5408. Those are the official records of the comparative numbers of English and foreign animals that have been in the market?—Yes. By permission of the chairman of the market committee I got these official figures.

Chairman—continued.

5409. And that is for the five months from July to November?—Yes, it is in the grass season.

5410. That is, I understood you before to say, the time when most of the foreign import comes over?—Yes. He has given me the other six months as well; he has given me from the 1st of January to the 30th of June 1876 in the same year, which is the spring and winter season. There the figures are quite different; the British cattle shown in the market then were 81,480, and the foreign cattle were 32,640. The number of English sheep was 489,600, and the number of foreign sheep was 353,150.

5411. Through those months the home trade supplies the market principally?—In those months the home trade in cattle is more than double the foreign trade; and the difference in sheep is about 130,000.

5412. What would that give for the whole year as a comparison between the British and foreign supplies?—I have given 11 months only; the last month is not given. I make it about 800,000 English sheep against 750,000 foreign sheep for the whole year. Then I make the beasts on a rough calculation about 108,000 foreigners against 158,000 English.

5413. That is very near the whole supply of foreign animals that comes into this market?—Yes, that is to London.

5414. I think in your examination last Friday, you were considering the import of dead meat from America as affecting the London market; supposing that instead of a live meat trade, a permanent dead-meat trade were formed from the Continent, how do you think it would affect the

Mr. *Gebhardt.*

18 June 1877.

Chairman—continued.

London markets themselves, taking in conjunction with it the present supply of dead meat from America?—I really believe that it could not be sold. It appears from these figures that we import from the Continent in five months of the year a great many more than 4,000 foreign beasts a week. According to the figures which we have had before us, about 3,000 American carcases of beef come in. That would make about 7,000 carcases of beef to be thrown into one market, which is, from my experience, impossible to be sold in London, because a great deal of this foreign meat is very inferior meat; when it can leave London alive it goes in the country and I think in London it would be valueless dead.

5415. You mean that when there is a glut at any time, if it is alive, the surplus that is not wanted in London can be spread over the country?—Yes.

5416. And if it were all killed you would not be able to travel it sufficiently well to sell it in the country districts to get rid of the glut; is that what you mean?—That is what I mean; I mean to say that if we have 4,000 foreign beasts and 23,000 foreign sheep, against 11,500 English sheep, half of those beasts and sheep, and perhaps more than half, would go within a radius of 200 miles of London, to Manchester, Birmingham, Liverpool, and Wales, and then again all along the south coast as far as Plymouth, and, I believe, every place right round the coast, and back again up to London by Gravesend, and those places. They come and buy foreign meat. We have some very good foreign beasts and sheep, but we have a great many very middling, or inferior ones, and this meat is particularly required for the mining and manufacturing districts. We should have such a lot here that we should not know what to do with it, and they would want it, and they could not get it.

5417. You mean to say that when you are obliged to slaughter the foreign animals you glut the market at particular times, and you cannot distribute the supply so well as you can if you are allowed to circulate the animals alive?—It is totally impossible.

5418. And the American meat supply you consider really makes that difficulty even greater?—Of course. Supposing that a thousand quarters of meat came into the metropolitan market, the evidence has shown that the American meat must be sold soon after it leaves the ship. This foreign meat must be killed at Deptford; all this meat must go to one market, and the market is so glutted occasionally that there is no sale; you would sell lots of meat at a great sacrifice, independently of what might be spoilt, so that you would ruin the two trades.

5419. You mean that it would reduce the price so as to prevent the trade being sufficiently profitable to induce the exporters to send cattle over?—That is it. The foreigner has two markets, and is not bound to come here. To-day, for the sake of argument, there is a supply of 7,000 sheep at Deptford. If France had not opened her frontier there would have been quite double that number; a little while ago we had 24,000.

5420. That is because the sheep are now allowed to circulate freely in France, and are taken away by that market?—Yes; and in reality that class of meat is dearer in Paris at the present moment than it is here.

Chairman—continued.

5421. Has the shortness of the supply very much increased the price to the consumer here?—I will not say that the consumer here has had the benefit of it. I believe that in the tremendously bad trades that we have had the butcher gets the benefit, because he raises his prices very quickly, and he goes down very slowly; and I believe this American meat has been a godsend to a good many of these butchers, because I have no hesitation in saying that they have bought lots of it for 4 *d.* per pound, and after they have cut the outside off, I should think they have charged the full price for it that they would have charged for English meat.

5422. What you mean to say is, that we have been eating American meat and paying English prices for it, and that the butchers have reaped an advantage in that way?—Yes; I have not found the butchers very anxious to come here and give evidence, because this American dead-meat trade suits them uncommonly well. Last Friday cart loads of meat were carted away from the Metropolitan Meat Market and boiled down at Deptford; and on Saturday the weather was just as hot, and American meat arrived in very fair condition, and sold at a fair price; so that the trade appears to me to be so wonderfully uncertain, that there is no reliance upon it, and when it comes it must be sold, no matter what it fetches. I have in my pocket sale-notes from the meat markets where the meat has been sold at 2 *d.* per pound.

5423. That I understand to refer to a good deal of this meat which has been described as bad, in consequence of the condition in which it was sent over, as to packing and otherwise?—There must be some fault. I will not fix myself to a date, but not many weeks ago a cargo of American meat came over; the first day it made 7 *d.* per pound in the Metropolitan Meat Market; this cargo arrived in Liverpool, and a portion of it was sent up each day; the next day it made 4 *d.* per pound; the next day it made 2 *d.* per pound, and the remainder was seized. I have figures here to show that in four days they destroyed no less than 14 tons.

5424. Are you aware that a witness who deals in American meat has stated that those facts really arose in a great measure from their not finding it come over in as good order as they thought, and forwarding it at once to London, as they could not sell it in Liverpool?—Yes, but those are the results of the same cargo coming up in three days; so that it showed that the longer he kept it the worse it got, and at last it came down from 7 *d.* to 2 *d.*, and then to nothing. What would be the effect if you brought all your foreign cattle to Deptford, and slaughtered them all, and brought all the meat to one market in warm weather, when meat must be sold in a very short time?

5425. The consumer would benefit momentarily by the reduction of price, but you think that the trade would not be continued?—They would not continue the trade. There may be great improvements to be made in the American trade, but I do not believe that it is a trade to be relied upon.

5426. You would admit that if the conditions under which they can send over their meat in good order here were carried out, and the meat arrives in good order, it would be a great boon to the country, as reducing the price to the consumer?

Chairman—continued.

sumer?—Certainly; and I have not the slightest doubt that, by science and by being more careful, they will succeed.

5427. And when they do succeed, you believe that the meat will be saleable in the London market, and that still the foreign cattle will come in and compete with it at the price at which it is being sold?—The foreign cattle would partly go to a different market; they can distribute the foreign cattle over a large area.

5428. But supposing that these conditions under which they state that they can convey and keep this American meat are carried out, will not that dead meat eventually take the place of your live animals, so that the dead meat will travel into the districts instead of the live animals?—There is a very good answer to that. Why do the Americans now try all they know to bring the beasts alive? I have not got the number, but there are a great many live American beast in the Metropolitan Meat Market; 127 American beasts were sold at Southampton yesterday. When American beasts are good, and are of the English breed, they are really good beasts, and they make as much alive as an English bullock, and a good deal more than a foreign bullock. They can bring these beasts alive, and they are doing it now, and I believe the difference of freight appears, from evidence which has been given before this Committee, to be about 2 *l.* per bullock.

5429. It was more than that; 7 *l.* was what the last witness stated was the normal freight, though it was brought down occasionally by competition whilst they were trying to get the trade?—Make the difference 3 *l.* if you like. Then, it appears to me, why should they try now all they can and get steamers ready for the purpose, and do it every week, to bring them alive instead of dead? I believe we shall get American beasts alive in summer, and very likely dead meat in winter, because, when the bad weather comes, they cannot bring them over alive from America. When they are alive they make as much money as English bullocks and more than foreign bullocks. I have many times gone to my stand in the market, particularly in a middling dry season, and supposing that I have 300 beasts to sell, after I have picked out 50, all the rest were of a very middling sort, and were only fit to go to a certain trade. A great many of those beasts and sheep are sold, as I tell you, to go for 200 miles round London.

5430. Then, I suppose, that you yourself would say that the existing state of things could not be altered with regard to the foreign import if the town is to be properly supplied in the future without, as you have described, the market being glutted at one time and deficient at another?—I think that the foreign live import must continue. My opinion, and I give this as a practical man of large experience, is, that I believe that these measures would hurt nobody more than the English farmer. If you kill all the beast at Deptford and bring American meat, where is the market left for him? Now London is the market which the English farmer looks to to send his best beasts. I know a little about this business, because I hunt in the shires, and I know a great many farmers, and they all say that if they cannot send their beasts to the London market they have not a good market to go to. Now London rules the corn trade in England, and the London

Chairman—continued.

market rules the cattle trade too. All the local markets take their tone more or less from the London market. If you bring 7,000 dead carcases of beef into London, where is there room left for the English farmer to sell his beasts?

5431. You mean that it would practically diminish the demand in the English market as well?—Yes. The butcher does not put on a ticket when he sends you a joint of roasting-beef, "This is English beef"; but he gets the inferior meat into you if he can, and therefore he would not buy the English beasts if he could buy the others much cheaper.

5432. I understand that your objection to an entirely dead-meat trade is, that from the amount of dead meat that there might occasionally be to be sold, the market would be glutted, and prices would fall so low, that there would not be the inducement to send over meat from abroad?—Yes, in one way; and in the other way I say that you would shut the English farmer off from the market, because he could not send his meat to the best market.

5433. At the same time, if that had the effect of stopping the foreign import, the prices would rise again, would they not?—Yes, of course time would rectify that.

5434. You state that you think it is desirable that the regulations as to slaughter at the port should be relaxed?—Yes.

5435. Do you believe that we should return to those regulations that existed prior to the cattle plague breaking out here, with regard to scheduled and unscheduled countries, leaving the trade from the unscheduled countries free, and replacing the restrictions on the scheduled countries that existed before the Order in Council that was made on the outbreak of cattle plague?—I believe that would be the best.

5436. You would return to the original orders which allowed cattle from abroad to circulate freely through the country, as long as they came from an unscheduled country?—Yes, just the same as they were before the late outbreak of cattle plague in January.

5437. And you state that, because you believe that the import of foreign beasts is necessary for the supply here?—Yes, from sound countries.

5438. Has your attention been directed to the question of the cow-sheds in London?—Yes, a great deal.

5439. Do you agree with other witnesses in believing them to be hot-beds of disease, as they have been described?—I believe there is a constant danger from the cow-sheds, because, from the excessive way in which they feed their cows for the purpose of forcing the milk, they always have pleuro-pneumonia more or less. If a man has a diseased cow in his shed, he perhaps has this cow slaughtered; he is afraid to take it to market; but the other cows which stood next to the diseased one are allowed to go to market, and they can, of course, be taken into the country anywhere.

5440. You represent that whilst the Islington Market is free, and you can buy cattle there in order to send them into the country, pleuro-pneumonia is spread from the London cow-sheds in that way?—I think you have a chance of getting a great deal of it.

5441. Would you propose to prevent these sheds being kept in London, or how would you deal with them?—I think there is no occasion to

Mr. *Gebhardt.*

18 June 1877.

Mr. *Gebhardt.*

18 June 1877.

Chairman—continued.

keep cows at all in London, because a great deal of the milk is brought in now from the country, and it must be much easier to bring milk in from the country than to bring all the hay and mangold wurzel to feed the cows with, and to take away all the manure.

5442. From the difficulties of inspecting and keeping any watch over those places where they are maintained in large towns, you think that they ought to be prohibited?—I think so.

5443. Because of their frequently being, as I understand you, the means of spreading the disease in the country?—Yes.

5444. Are we not liable also to get diseases spread from the Islington Market as long as the animals are circulating through it into the country?—I believe in that market, and now lately, we have been very free from foot-and-mouth disease; but at almost all other times there is foot-and-mouth disease in those lairs; and I consider that either English or foreign beasts, if they ever go to that market, should never go anywhere else excepting for killing purposes, because I think the great mischief is done by jobbing. If we have a bad trade a man comes and buys in this market, very rarely foreigners, but he buys English cattle; he will take, perhaps, 40 or 50 sheep, or 40 or 50 beasts, more or less; he can buy them worth the money, and he takes them to another market, say Romford, or Croydon, or Southall, or perhaps further off, for the sake of getting a few shillings profit. Those beasts almost always carry disease in cases where foot-and-mouth disease or pleuro-pneumonia exists. They have been in those lairs, and it is almost certain that they will have caught the disease if the disease is at all in the country. When I had beasts to sell in that market and I did not sell them on the Monday, but turned them out into those lairs, on the Thursday they showed signs of foot and-mouth disease. I believe, of course, that if the country is free from disease it would not matter so much; but it is very rarely that those sheds are free, and I believe that that market ought to be to all intents and purposes a market for fat cattle and not for stores.

5445. You would limit Islington, in fact, to being a fat-cattle market?—Yes.

5446. How would you regulate that the cattle should be circulated in the country, and yet be only sold for slaughter?—By having just the same regulations as are enforced with regard to cattle plague. Then nothing could leave the market without a killing license. The radius was then, of course, not so large as I would make it; but I do not see anything to prevent a man buying cattle or sheep, taking them to Plymouth or Wales, or anywhere by a killing license.

5447. You would allow of their free circulation, but you would so mark them or surround them with such penalties if they were not sold absolutely for killing as to limit it to a killing trade?—Yes, because the law would not very often be broken; I should say that ninety-nine out of a hundred that would be sold there would be sold for killing purposes. Supposing that a man sends his beasts from Leicester a hundred miles up to London, it would not pay another man to buy those beasts and take them back again; if he buys them, certainly he buys them for killing purposes.

5448. Then it practically does not pay a farmer to send his beast up to market and to take it back home, or take it to another market for sale?—A farmer does not do that. He sends his cattle or sheep to London, and says, "They must make the best price they can;" but a jobber says, "These beasts may be worth a few shillings more next Wednesday at Romford," or elsewhere, and he takes them there; and, perhaps, at those small places you have store beasts or sheep as well as fat cattle, and another man buys those animals and takes the disease home. We are not supposed to bring any beasts or sheep with disease, either foot-and-mouth or pleuro-pneumonia, to market, because they are killed at the water-side if there are any in the cargo.

5449. And you believe that in this way you would diminish the probability of the spread of disease in the country by making the Islington Market simply a fat stock market for killing, so that there would not be the chance of our English animals getting the disease in the lairs?—I believe that might be done.

5450. I suppose you would mark the animal, then, as they did at the time of the cattle-plague?—Yes; for instance, bullocks are very easily marked, because when a bullock is shown in a fair he has got long hair on his tail, and it is customary when we sell the beasts for killing purpose, to clip off those hairs, so that he would carry off the sign with him that he had been shown once before.

5451. Is there anything else which you would wish to represent to the Committee in your examination in chief?—With regard to foot-and-mouth disease, it was stated that Denmark was free from foot-and-mouth disease.

5452. One of the witnesses stated that it was free, and that they had had only one or two outbreaks of it in that country during the last few years. There was one case last year in which seven animals which came from Denmark were found to be affected with it, but that was the only case that was stated, I think?—We had this year one diseased cargo from Denmark, so that supposing Denmark is free from foot-and-mouth disease those beasts must have caught it on the journey, because when they came here they had foot-and-mouth disease, and they had to be reshipped and sent to Deptford.

5453. I think that was the cargo which was mentioned here by Count Danneskiold?—I was not here when he was examined.

5454. Upon that, I asked the Count whether the vessel had touched at any other port after embarking them from which she might have brought the disease?—That was on the 24th of February this year.

5455. Is that all that you wish to say with regard to that?—Yes.

Mr. *W. E. Forster.*

5456. I gather from your evidence that you deal rather more in sheep than you do in cattle?—No, I do not; but my cattle trade this year has been entirely stopped because of the importation being stopped. I used to deal very largely in cattle before the trade was interfered with.

5457. But, at the present time, owing to the existing regulations, you deal rather more in sheep than in cattle?—Yes, I have very few cattle now.

5458. I do not know whether you can give me any information upon this point, but have you ever formed any opinion as to whether, taking into

Mr. *W. E. Forster*—continued.

into account the animal food consumed in London, there is more mutton or more beef consumed?—I have not given much attention to that matter, but I should fancy that there is more beef consumed.

5459. As regards the weight of meat that comes from abroad, generally speaking, is there more mutton or more beef?—In the first part of the season, that is to say, from the 1st of January to the 1st of July, there is certainly more mutton. Since Germany and Holland have been scheduled the importation from those countries has been very small; in fact from Germany there has been none at all; so that I should say, certainly, in the first part of the year there is more mutton; and afterwards, when the Tonning beasts begin to come in, I should fancy (but I am only speaking from impression) that there is more beef.

5460. The Privy Council Returns for 1876, give 159,935 head as the number of foreign cattle brought into the London market, and 806,644 as the number of foreign sheep; can you give us any notion, as regards the number of pounds of meat, what would be the proportion as between the beasts and the sheep?—If you take the average weight of foreign sheep and the average weight of foreign bullocks, I should say that 12 sheep would be equal to one bullock; that is taking the bullock at 600 lbs. and the sheep at 50 lbs.

5461. In that case, as regards food, the cattle supply a much larger proportion of it than the sheep?—I believe so. I should reckon the beef at about double the mutton.

5462. Where do you get your foreign sheep from mainly?—The foreign sheep, say from the 1st of January to the 1st of July, almost all come from the centre of Germany, that is to say, Berlin, Magdeburg, Dresden, and then round to Bavaria, Wurtemberg, Baden-Baden, and the Rhenish provinces.

5463. They are generally of the merino breed, are they not?—They are generally of the merino breed, crossed now with English sheep.

5464. I suppose that, generally speaking, they would be smaller than the home animals that go into the London market?—Yes, the average weight of those sheep would be from 48 to 56 lbs.

5465. What is the average weight of English sheep?—The average weight of English sheep, if you take a Southdown, which is considerably the smallest, would be, perhaps, from 64 lbs to 72 lbs.; of course when we get to Lincolns and Gloucesters they go to any weight, say 160 lbs.

5466. Taking Table VII., at page 128, the proportion of sheep, which is 48 per cent. of the foreign animals imported, would be a great deal larger than the proportion that the weight of the sheep imported would bear to the total weight of the animals imported, would it not?—Yes.

5467. Going now to beasts, your Schleswig-Holstein beast is nearly as big as the average English animal, is he not?—No; there are two distinct breeds in Schleswig-Holstein; there are the store beasts, which they get from Jutland, which are small beasts; but what they call home-bred beasts are mostly bred from English stock, and they are heavier, and those beasts are in a great many instances, on an average, as heavy as English beasts.

5468. With regard to the dead meat from America, I suppose, from the answers which you

Mr. *W. E. Forster*—continued.

have given to the Chairman, you think that as yet we do not know enough about the trade to know whether it will be a great success or not?—No, I think not. I think the trade is too young, and there has not yet been experience enough to teach us whether it will last.

5469. That being a matter of opinion, I am going to ask you about the trade as it is. We were informed by a witness who had a good deal to do with the management of the trade, that about three bullocks went to produce a ton of American meat; do you agree with him as to that?—I believe that that is correct.

5470. Am I not right in supposing that, so far as the trade has yet been tried, about as much came in in the first three months of this year as has come in in any other three months?—The figures in these last three months are stronger than they have ever been before, I believe. I did not take the figures down, but I think I remember that they increased in almost every week.

5471. I have before me a return of all the dead meat for the first three months of this year, ending the 31st of March, and I suppose that includes not merely the American meat, but other forms of preserved meat, and so forth?—I have not the figures.

5472. The dead meat imported from the United States into London in those three months is stated to have been 55,251 cwt., including everything, salted and fresh; that is 2,762 tons, and that at three beasts to the ton, would be 8,286 beasts; assuming those figures to be correct, do you think that an import of 8,286 beasts into London for a quarter of a year, has any perceptible effect upon the consumption of London?—As it is all consumed in one place, I think of course that the effect of it would be to lower the price of meat considerably, as in fact it has done.

5473. You have heard of the proposals that have been put before this Committee, one of which is that all live cattle from the Continent should be prohibited; what effect do you think that such an order as that would have upon the price of food in London?—I think that it would make meat very dear indeed.

5474. Have you any idea, in your own mind, of what it would bring the prices to?—I think that it would be very presumptuous for me to offer an opinion, because it would raise the price all over England, of course. If London is the dearest market, the English stock would come here; but I believe if that was the case, it would cause a general rise all over the country.

5475. What are the foreign markets that mainly compete with London for foreign cattle?—I think that France would be a great consumer, particularly in the mutton line.

5476. France does not grow her own meat now, does she?—France has been always a large importer of German sheep.

5477. What difference in price in the Paris market, as compared with the London market, will divert a cargo of beasts or sheep to Paris instead of its coming to London?—A very trifling amount. In the case of merino sheep I should say that 1 *s.* or 2 *s.* a sheep would divert them to London instead of their going to Paris.

5478. And what is the case of a beast?—For a beast I should say that 10 *s.* or 1 *l.* a head would divert them.

5479. It is easier for the German sheep to get

Mr. *Gebhardt.*

18 June 1877.

Mr. *Gebhardt.*

18 June 1877.

Mr. *W. E. Forster*—continued.

across the frontier into France than it is for Schleswig cattle to get there, I suppose?—The Schleswig cattle would go and supply the wants of Germany more than of France, because Germany is only an exporting country of beasts in the first six months of the year, and then they are principally stall-fed. It is now a fact that when the grass season commences, a great many Schleswig-Holstein beasts go into the interior of Germany, and even as far as the Rhenish provinces. Of course we cannot tell what effect it would have if they could not come to England, and whether they would not go more to France than they do now.

5480. You said, I think, that you did not expect that the half-frozen dead meat would come over from the Continent from Germany at any time?—No, I believe it would not pay.

5481. Why should it not pay from St. Petersburgh or the Russian ports?—I do not know. That is a matter to which I have never given any consideration; it is a question whether they have got any to send, and next, whether you would like to have them, because they would bring you the cattle plague.

5482. You mean, if those witnesses are right who think that dead meat would be as dangerous, in respect of cattle plague, as live cattle; but supposing that fear removed, every other condition would exist in Russia, would it not; there are a great number of cattle, and there is plenty of ice?—I cannot give any opinion about the Russian meat, because I have not any experience of it.

5483. Taking the regulations before the cattle plague order was issued, the regulations to which the Government might return after the present fear of the cattle plague is removed, what would you think would be the immediate effect of ordering all the foreign cattle to go to Deptford market?—The immediate effect would be that a great many would be compelled to go there this year, because people, of course, have not been prepared for this order, and they have increased their breeding and their grazing every year; and it always takes a time for trade to regulate itself. It might be, of course, a great blow for those people if such an order were to take effect without warning; and I believe, if this American meat were to continue on the top of it, it would be very disastrous, and an immense lot of money would be lost on the Continent, until they found other markets.

5484. You think that the effect would be that we should get the cattle this year, but that it would be at such a loss that we should not get them next year?—The supply would diminish every year. As the witness said the other day, if American meat can be sent here, and is sold at 6 *d.* per lb., it leaves a profit; and if it be true, as he stated, that their surplus would feed all England, then there would be no need of English or foreign beasts.

5485. Putting aside, at present, the effect of the import of American meat, what would be the effect of ordering the foreign cattle to be slaughtered at Deptford?—If all foreign cattle had to be slaughtered at Deptford, and they had to compete, as dead meat, with the American meat in the meat market, the loss to the foreign grazier would be so great that he would try to avoid this market as much as he could, and to find other sources which trade always will find. A man may go to market and lose one or two weeks; but then he will try to find other channels, and, if he could not find other channels for selling his beasts, he would produce less.

5486. Orders are sometimes obliged to be suddenly given for cargoes to come into Deptford, are they not?—Occasionally, when we have any disease detected, they go there; but that is only a single cargo, and that may be disposed of without a very severe loss.

5487. Is not that uncertainty whether they will be allowed to go to the Islington Market, or whether they will have to go to Deptford, a great inconvenience to the trade?—No, I think not; because if a foreigner puts diseased cattle or sheep on board, he does it with his eyes open, and takes the risk.

5488. I was not speaking of an order which may be issued with reference to what may be found out about his own cargo, but he is subject to considerable fluctuation, on account of what may happen in the countries from which he exports. For instance, was not the order which directed all the cargoes to go to Deptford issued almost suddenly, on the appearance of cattle-plague this year?—Yes.

5489. Is it not a very great inconvenience to be subject to that doubt as to whether you must slaughter your cattle at Deptford or whether you may take them to Islington?—I think the uncertainty is a great deal better than the state of things would be if you made a permanent affair of it. Cattle-plague, I hope, will never come here again, and if it had been treated properly it would not have come now. The veterinary surgeon at Hamburg has been dismissed by the Prussian Government for negligence of duty, and I believe that they will take such precautions that perhaps we may be safe from cattle plague. But as to the other diseases, I think we shall not be safe. Before they put sheep or cattle on board they are well examined; then, if a cargo of, say 400 or 1,000 beasts goes to Deptford, there is not such a glut, and they can be disposed of; but if they knew it was always permanent, they would try to find other channels, or they would breed less. That is my opinion and experience, because I am sorry to say that I have had experience of this when we have been obliged to go to Odam's Wharf, or to the Victoria Docks, or to Deptford, and the loss that has occurred there has been frightful sometimes.

5490. Would not the certainty of the trade and the removal of these fluctuations in a short time compensate you for the present disadvantage of sending them to Deptford?—Certainly not.

5491. Do you not think that the trade would get accustomed to the restrictions at Depford and adapt itself accordingly?—No, because whilst you have cattle at Deptford you cannot take them out, and you have only a certain class of customers, and those customers in a bad trade are not very fair customers; but you submit to their price because you have no other chance. In a very strong market they almost get them at their own price. I have known a man who could not a few years ago pay for an old cow at Deptford, and he can now tender a cheque for a thousand or two. At Deptford you keep out all the country buyers and all the small butchers, and the trade must be in the hands of large men; because, if a man goes to Deptford, he must have an extra slaughter-house, and he must have an extra

Mr. *W. E. Forster*—continued.

extra staff of men. He must either avoid the trade or he must go into it; and all the 200 mile customers cannot come there. I represent the trade not only in London but also very largely on the Continent, and they would rather submit to stringent regulations in England that if they send a diseased cargo they should pay the penalty than that the trade should be stopped altogether.

5492. I suppose that the population within the Metropolitan district is at least 4,000,000?—I believe it is.

5493. And you do not think that that is a sufficiently large market to be self-sufficing, as it were?—No, because we should be overburdened with a class of meat which we should have no outlet for. For instance, a little time ago we had 24,000 merinos in Deptford; if it had been warm weather those sheep could not have been sold, but it was cold weather, and the people from Manchester, Birmingham, Liverpool, Wales, and the South of England, came and killed those sheep at Deptford and took them away.

5494. I think I understood you in your evidence in chief to say that the inferior meat went off into the country?—A great deal of it does.

5495. I should have thought that there must have been a large population in London who would have been as willing as anybody in the country to buy that inferior meat?—Yes, but if you have got ten baskets of strawberries and only want one, you must let the others spoil. We might have done it before the American meat came, but as the American meat must be sold at any price after it has been here a day or two, the result must be that the market will be glutted.

5496. Have you any idea of what proportion of foreign beasts that come into the port of London go out alive from the metropoliton district?—I should say, from my experience (of course I will not talk of correct figures) that about half the supply of foreign beasts and sheep that go to Islington Market are distributed over the country. I could show by my books what I sell to country buyers.

5497. You have been a long time in the trade, have you not?—I have been in it for 40 years abroad and here.

5498. As an average, in making your calculations of profit and loss, how many days do you think that you have to keep the beasts before you get rid of them?—Beasts arrive mostly on the Saturday, but in rough weather perhaps they arrive on the Sunday, and if they can save the market they are sold on the Monday. It is very rarely that they are turned out or kept over, because I think it does not matter whether they are English or foreign beasts after they have once made a journey to a market and stood that market the sooner they are disposed of the better, because of the additional expense of their being in the lairs, and the risk of their getting foot-and-mouth disease; so that I as a rule hardly ever keep any beasts from one market day to the other, but sell them on the next market day after they arrive.

5499. Do more beasts or more sheep that come from abroad go into the country?—In the spring I should say that more sheep go into the country, but in the grass season we supply nearly all Kent and Surrey with beasts. I should fancy that there are very few butchers in Kent and Surrey, right down to the South Coast, who do not come and buy some of the foreign beasts. I should say the beasts would be more than the sheep in the grass season.

Mr. *W. E. Forster*—continued.

5500. You are aware that one of the suggestions which has been made is that there should be greater freedom of import into London, but that the cordon should be continued, and that no animals should be allowed to be sent out of London; what do you think of that suggestion?—I think that that would be very injurious to all, because, as I have already stated, if a man happened to live just a mile beyond the radius he could not supply himself with the article which he required.

5501. Do you know when the Order in Council was issued this year drawing a cordon round London in consequence of the cattle plague?—In January.

5502. Therefore it has been in existence about five months?—Yes.

5503. What effect has it had upon the price of meat?—It has not had an effect upon the price of meat, because our meat has been kept down by the price of the American dead meat. A great many sheep, as I have already stated, have been taken away from London.

5504. You remember that in 1872 we had no American meat, and we had the cordon then; what effect had it at that time?—I think it made the meat very dear in those districts where they could not get it from London.

5505. What effect had it in London itself?—I remember that we had very heavy markets at times; the trade was uncertain, much more so than it is if they can go away; but I could not remember the price of meat.

5506. There was a cordon drawn round London for many months during the time that cattle plague was raging in 1865, was there not?—Yes.

5507. What was the effeet of it then?—I rather think that meat was dearer because the English beasts were short, and I think the importation was very large at that time; but I have not got the figures before me, and I should not like to speak positively upon that point.

Mr. *Wilbraham Egerton.*

5508. How long do you think that the cattle from the Continent, from Germany and from Holland, would be able to go on competing with the American meat?—That is a very difficult question to answer, because you see now the prices have got to such a height. When you have meat at 9 *d.* per lb., that means 6 *s.* a stone, which is the price of beef, and sheep are dearer. I think there is a great margin that prices may be lowered, and if the prices gradually went down the prices of English stock would gradually go down to the prices of the foreigners. I do not think you could come to a definite conclusion about it.

5509. What is the lowest price at which it would pay the foreigner to send his meat here in any shape?—My recollection is, that when cattle were first imported from the Continent the price of English meat and foreign meat was under 6 *d.* per lb. sinking the offal. What we now sell for 6 *s.* we sold then for 4 *s.*, and I have not the slightest doubt that, by an increased importation of American meat, the price would be gradually reduced; but they would keep on sending as long as they found a fair market.

5510. You assumed in one of your answers, that

Mr. *Gebhardt.*

18 June 1877.

Mr. *Gebhardt.*

18 June 1877.

Mr. *Wilbraham Egerton*—continued.

that Germany and those other European countries would go on sending the same amount of meat as they do now, in addition to the American meat; on the contrary, would not the effect of a constant supply of American meat be gradually to reduce the quantity of meat coming from the Continent, so that there would not be the glut to which you alluded in your answer to the Chairman?—If you do this gradually, of course the trade will regulate itself.

5511. Would not the London market eventually be much better supplied, as you suggest, by American dead meat in winter, and by American live animals and dead meat in summer, whichever the Americans choose to send, than it has been by the foreign meat up to the present year?—But I do not see why you should throw a very good food away which has now stood the test for 35 years. The foreign importation has lasted 35 years, while you are going to calculate on a fresh trade which has only existed for a year.

5512. But you admit that the American meat itself is better than the foreign meat, and that the live American animals fetch more than the foreign animals?—Yes.

5513. Then there can be no objection, if we can get American meat, to our doing away with the inferior foreign meat?—That is not the reason why we should do so, because everybody is not a rich man, and you want to feed the poor as well as the rich; and if you can produce an article which is less per pound, the poor man will buy it, while, if you have nothing but a superior article, perhaps he could not afford to buy it.

5514. Then your opinion is that unless the animals came alive from the Continent there would be no more dead-meat trade from the Continent?—No, I believe not; I believe they would find other means to get rid of their stock, because the expense and risk which I see in the dead-meat trade would prevent their sending it.

5515. You do not think that the Germans would go to the expense of fitting up vessels for the purpose of the dead-meat trade, with the possibility of their being eventually beaten by the American competition in the same trade?—I think that, so long as they could find an outlet for their live stock in any other way, or could utilize their land for any other purpose, they could not breed and fatten cattle to be sent here in a dead state.

5516. I suppose that the value of land and of live stock in the north of Germany has increased very much in the last 15 years, has it not?—It has doubled.

5517. With regard to slaughtering the animals at Deptford, are you aware whether at present the offal is taken from Deptford to the towns in the north?—In the cold weather, such as we had this winter and in the spring, they have taken the offal away. A witness who will probably be examined hereafter, will tell you that he has taken it to Wales; and he stated last week that a lot of his offal was spoiled, and he could not take any more; it will not do in hot weather.

5518. Do you state of your own knowledge that the offal will spoil if it is sent in the hot season?—Yes, that is of my own knowledge.

5519. Do butchers ever take cattle from the Metropolitan Market at present, and slaughter them at the Deptford Market?—Never, to my knowledge.

5520. Do you consider that slaughtering cattle at Deptford is more expensive than slaughtering them on the premises of the butcher?—Yes; because he is obliged to have an extra staff and an extra slaughter-house.

Mr. *Wilbraham Egerton*—continued.

5521. You have spoken about the advisability of separating the fat animals from those animals which might be bought as store animals; how would you propose to create a fresh market where store animals could be bought in London?—You do not want to buy store animals in London at all; and very few are bought in London at present. I think that very few men would run the risk of buying store animals in the London market, unless they desired to get the complaint.

5522. You think that it would be advisable that all the animals in the Islington Market, as in the Deptford Market, should go out slaughtered, or marked for slaughter, within a certain period?—That is my opinion.

Mr. *Torr.*

5523. Do you deal at all at Deptford as well as at Islington?—Yes.

5524. Do you find a marked difference in the two markets?—Yes, a great difference.

5525. In what way?—In the Islington Market I have got the whole trade, and there is competition; at Deptford I am reduced to a few buyers, who lay themselves open for their trade.

5526. You do not do anything in dead meat at all, do you?—I do not.

5527. And you have a very large trade in this live stock that is imported from abroad?—Yes.

5528. Have you ever imported anything from America or Canada?—I have not.

5529. Your entire business is in the import of live stock from the Continent?—Yes.

5530. Then if, as has been suggested, the stock from the Continent, or from Germany and Holstein, should come in the shape of dead meat instead of as live animals, your trade would be completely destroyed?—That does not follow. I do not believe that I should do it, but if I meant to do it the same trade would come to me, because if I established a dead-meat trade the same connection would come to me as if I had a live-stock trade.

5531. But at present you say that you do not do anything in the dead-meat trade?—No, I do not.

5532. Your chief objection to the dead meat coming from America is to the imperfect condition in which it comes, is it not?—In which some of it comes.

5533. You admit that the meat itself is a very superior class of meat?—A great deal of it is very good meat; I have seen inferior, but the greater part of it is good.

5534. You seem to have an opinion that it will not increase, owing to the imperfect condition in which it comes?—No; I said that I believe, from what I have seen of the importation, that if they bring it in large lots in one cargo it comes in a bad state, and small consignments come in a good state; so that it appears to me that it is a want of space, and of course a question of expense.

5535. But I presume your opinion would change, supposing that by any improved mode of transit that beef could be brought in a sound and fresh state to this market?—I believe that it could,

Mr. *Torr*—continued.

could, because if they brought it sound occasionally they might bring it sound again.

5536. It might all be brought in as good a state as the small specimens that you have seen, might it not?—It might be possible if they had space enough.

5537. If all the dead meat that comes from America came in as good and sound a condition as the small quantities which you admit have come in that good condition, it would then be a more formidable rival to your foreign German beef than it is now, would it not?—Of course it would.

5538. And it would form a more efficient supply for the London market?—Yes.

5539. Rendering you more independent of the German supply?—Yes.

Mr. *Jacob Bright.*

5540. Do I correctly understand that all the cattle from the scheduled countries for London go to Deptford for slaughter?—Yes.

5541. There is no other place in the country for London but Deptford?—No, no other place.

5542. How soon must the cattle be slaughtered when they go to Deptford; must they be slaughtered immediately?—I think there is a law that they must be slaughtered within 10 days, but they are always slaughtered as soon as they can find a sale.

5543. Is there any given time when they must be slaughtered?—Yes, I believe they must be slaughtered in 10 days, but I am not quite certain whether it is so or not.

5544. You seem to have a strong opinion that to compel the cattle to be slaughtered at Deptford must reduce the trade?—Yes, certainly.

5545. Can you make it clear how it would lessen the trade; is it simply because it cannot wait for a market?—No, it is because it would not realise the good price which it would realise in an open market. Therefore, if a man gets less for his stock, he will send less.

5546. But it is not very clear to my mind how it is that there is not an open market; how is it?—You do not get the men from the country who take it away from London, and you do not get the retail butcher.

5547. Why not?—Because the man from the country cannot buy it, because he wants his stock home alive; and the retail butcher cannnot do it on account of the expense. It would not pay him to have a slaughter-house at home, and a slaughter-house at Deptford, and a double staff, so that he is actually prohibited from doing it.

5548. So that it creates a sort of monopoly?—Yes.

5549. In addition to that he cannot wait for a market, and the meat must be consumed, and that must be a reason why prices are sometimes driven down?—Yes.

5550. Then you have a strong opinion that where you compel cattle to be slaughtered you must necessarily greatly diminish the trade?—Yes; the price must be reduced, and of course it would not pay the sender, and he would try to avoid a market where he thinks he has no fair chance.

5551. And therefore if any such regulation as that were enforced in this country it would, of necessity, deprive the people of this country of much meat which they would otherwise have?—Yes.

Mr. *Assheton.*

5552. You gave an answer on Friday that rather puzzled me; I understood you to say, when you were talking about foot-and-mouth disease, that if that disease were stamped out of the country, you thought that under the conditions of this climate, the disease would always break out again; was that what you said?—I do not exactly say that it would do so under the conditions of this climate; I believe it is a disease that is liable to break out spontaneously in any country.

5553. Can you then, in your own mind, at all account for its never, so far as we are aware, having broken out in this country previously to 1839?—No, that is impossible for me to account for, or anybody else, I think, because it is a disease that might have been prevalent under another name; but of course I am not at all in a position to give an opinion as to that.

5554. I understand you, then, to think that there is something in the soil which will breed foot-and-mouth disease; that is your idea, is it?—My idea and experience is that it will appear in cattle when they have travelled, and after they have been sent from a distant country, even store cattle. I speak now from my own experience; I have bought stores at a fair which were apparently sound and healthy; I have taken them home, and after some time, they not having been in contact with any other cattle after I bought them, foot-and-mouth disease has appeared. So far as I know, there might be, as the Chairman said the other day, a dog crossing the fields, or something of that kind; but otherwise they had not been in contact with any other cattle, and the disease broke out spontaneously.

5555. I presume that you drove them along the high road?—Of course I did; they came home by rail, and after leaving the railway they had to go a certain distance home.

5556. Cannot you conceive the possibility of their having caught the disease on the high road, as well as of their having bred it out by themselves?—Of course that may be.

5557. But you can offer no theory why the disease should have appeared in 1839, and should never have appeared before?—I cannot give an opinion about that, and I suppose nobody else can.

5558. As a matter of fact, in rough weather at sea are cattle sea-sick?—I do not believe they are.

5559. Will they eat and drink?—They will not eat so well; I have seen a great many come across, but I have never seen any sick.

5560. But they get off their feed, do they not, in rough weather?—Yes, naturally; and so would any other animal if you took him, not across the sea, but away from his own food; he will not feed for the first 12 hours, but the second day he is sure to feed. I have seen them myself, because I have been across myself many times with cattle that have been coming over.

5561. Have you ever been many days at sea with cattle?—I have never been longer at sea with cattle than three days, from Germany to London.

Mr. *Mundella.*

5562. Did I correctly understand you to say that France was a competitor with us for German meat?—Yes.

Mr. *Gebhardt.*

18 June 1877.

Mr. *Mundella*—continued.

5563. And that the tendency would be, in your opinion, if meat had to be slaughtered at the port of entry, that it would become cheaper in France and dearer in England?—That is so, because the supply would go to France and would not come here.

5564. Does not France derive a good deal of its supply from Switzerland?—I think not. There may be some part of France that may get some bullocks from Switzerland, but I think not many; not to my knowledge.

5565. Are you aware that the Americans are making great efforts to bring the beasts over alive?—I am.

5566. And that they have succeeded to some extent?—To a great extent. There are some here to-day.

5567. Do you know that some of them have realised very high prices in this market?—Yes, very high prices.

5568. What prices have you known?—I have not sold them myself, but I know that some of them have made from 30 *l.* to 40 *l.*

5569. Should you be surprised to hear that some of them have fetched 50 *l.*?—No; I have not been in the trade, but I have been told that they were extraordinarily fine cattle.

5570. You stated in your opening evidence that American meat realised the first day 7 *d.*, the second day 4 *d.*, the third day 2 *d.*, and that the balance was destroyed on the fourth day; I suppose that that is the reason why the importation of dead meat will always be a difficulty, inasmuch as it will be a fluctuating market, and the consignor cannot tell what price he will realise for his consignment?—No; it is an uncertain trade.

5571. Whereas the live cattle trade is a regular and a tolerably certain trade?—Yes.

5572. That is naturally the reason why everybody will prefer sending live cattle to sending dead meat, is it not?—Yes.

5573. Supposing that all the cattle that came into the port of London were to be slaughtered at Deptford, what effect would it have upon the inland markets at the great centres of industry, such as Birmingham and Sheffield, and those places?—The effect would be that those places, which are now great consumers, could not get that class of meat which they require, and they would be obliged to buy the English meat, which is comparatively dearer, which makes more money; and perhaps a great many of them would go without meat, not having the cheaper food at their market.

5574. You mean to say, in fact, that it would make the price dearer?—Yes, it would make the price dearer in the country and cheaper in London.

5575. It would make it cheaper in London for the time?—Yes.

5576. But that cheapness in London would gradually disappear, I presume, in consequence of the meat coming to an unremunerative market for the grower?—Yes, that is it.

5577. Meat would be cheaper in Germany and France and Belgium, and dearer in London, in fact, in England; is that your opinion?—The trade would regulate itself. If a man could make a better price in Germany or in France than in England, then he would not come here.

5578. And if he did his trade at less risk there than here he would not come here?—That is so.

Mr. *Mundella*—continued.

5579. The greatest element in trade is that a man can calculate on a profit, is not that so?—That is so.

5580. And there is nothing so inimical to the progress of trade as uncertainty in price?—There is nothing so bad.

Mr. *Ritchie.*

5581. I think you said just now, in answer to the honourable Member on my right, that the effect of slaughtering at the place of debarkation would be to make the meat dear in the country and cheap in London?—Yes.

5582. If meat were cheap in London, would it not be sent into the country in a dead state?—It could not in warm weather.

5583. Do you mean to say that there could not be appliances for taking it down as far as Birmingham or Sheffield?—The proof of it is that they do not do it.

5584. Supposing that it were cheap in London, would it not be quite possible to meet the demand in Birmingham and Sheffield by sending the dead meat down there if it were to be had cheap?—No; because by the time they got the meat there it would be spoiled.

5585. By the time they got the meat to Birmingham?—Yes, because, if you kill the meat to-day, it could not get to Birmingham till to-morrow.

5586. Do they not bring dead meat up from Aberdeen?—Yes, they do; but that is quite different. In Aberdeen, first of all, it is much colder, and very little comes from Aberdeen in summer.

5587. It may be colder in Aberdeen, but it has to go through a warmer climate before it comes to London, has it not?—Yes, but I tell you very little does come from Aberdeen to London in hot weather.

5588. Do you not think that appliances would soon be found, if meat were cheap in London, for taking it down into the country, if it were wanted there?—Yes, but the question is, how long the meat would be cheap in London.

5589. I am assuming that the slaughtering of cattle at Deptford would make meat cheaper in London and dearer in the country?—I have stated that I believe that, if they were obliged to go to Deptford, the price would be so bad, that presently they would cease sending. It is like Billingsgate; you might get a glut of fish one day and buy them at any price, and the next week, perhaps, you have to pay double or three times as much.

5590. You said, I think, that it would render meat cheap in France and dear in England, if you had to slaughter it at the port of debarkation?—I did not exactly say that; I said that if they found a better market in France, and without restrictions, they would send there instead of coming here; and ultimately, by cutting off the supply by restrictions, you would then, perhaps, raise the price of meat in England.

5591. You said, I think, that if the meat had to be slaughtered at Deptford, one of the effects would be to divert the meat from coming here, and to send it to some other market?—Yes.

5592. On the Continent, I presume?—Yes.

5593. But if the meat which at present comes here were to be diverted to some other market on the Continent, would it not very much diminish the value of that meat in the market to which

Mr. *Ritchie*—continued.

which it was diverted?—No, it would not all go to one market, it would be distributed.

5594. Do you not think that if the whole supply that we get from the Continent now were diverted to continental markets it would lower the price in those markets?—I said that if you killed the beasts or sheep at Deptford you would diminish the supply to this country; I do not say that it would cease entirely; they would find other markets to take part of their supply to.

5595. You think that it would still come here?—It might. Of course it is impossible for me to prophecy what would happen; but I take it, as a matter of common sense, that the trade would find its own level. If a man finds that one market does not pay him he tries to find another market; and if he found that the price rose again in England he might come here again, because he has always the option of going wherever he likes.

5596. If he finds that by diverting it to some market out there it reduces the price below that which he can get in England, of course he would come back to England?—Certainly.

5597. Was it not one of your objections to slaughtering at Deptford that it would diminish the price, because it would diminish the number of buyers?—Yes.

5598. Do you not think that if all the cattle had to come to Deptford the buyers would go there in larger numbers than they go now, when only certain quantities have to be slaughtered?—No, I think not, because you cannot carry on a large trade in two different places; the expense would be so enormous to keep a staff of men at home and a staff of men there, and an extra slaughterhouse, and every thing. That has been proved by those men who go to Deptford. A great many men never go there; a butcher the other day, Mr. Lyon, said that he had never been to Deptford yet, because it would not pay him on account of the expense.

5599. I can easily understand that where it was an erratic sort of market a man would not go there; but if the market were diverted entirely there for importation from the Continent, would it not be worth while for men to go there who do not go there now?—It might be, but it is a trade which would be attended with great risk. There is such an uncertain trade in the dead market, having the American meat to contend with, that the whole trade would be ruined. If the man who sends the beasts found that this market did not suit him he would not come.

5600. It is all very well to make that statement, but I am taking you into one of the reasons that you give for that market not being suitable, that reason being that there were few buyers there; where a market is comparatively a small market and an erratic market, a few buyers might go there; but if it were a large market where all the meat went to, would not a great many more buyers go there?—They might.

5601. So that possibly so far as that objection is concerned, it might be met?—It might.

5602. You said that one of your reasons for objecting to the Deptford market was, that it would diminish the price, because the beasts could not be removed without being slaughtered. I understood you to suggest that the live animals should be allowed to come to the London market, but that they should not be allowed to leave except for the purpose of being slaughtered?—Yes, wherever you take them to.

Mr. *Ritchie*—continued.

5603. Would not that objection equally apply to the state of things when they would be sent to market, and could not be removed without being sold for slaughter?—No, that would be no objection at all, because there are plenty of buyers to buy them, and to take them all over the country.

5604. I understood you to say that you would draw a cordon?—No; I said that wherever they go to, they should go for killing purposes.

5605. I understood you to say that a certain cordon should be drawn, past which the cattle should not go; and then you went on to say that you would draw the cordon much larger, probably, than it was drawn before?—I do not recollect saying anything of the sort. I said distinctly that the Islington Market should be a market only for fat animals, and that they should be obliged, under a killing license, to go to wherever they were sold, but they should not be exposed again for sale in any other country market.

5606. How far from London do you think that live animals would be taken if they were sold only for slaughtering purposes in the London market?—Just as they were taken before the last Order in Council in January. As I have already stated, we supply to within a distance of about 200 miles round London; for instance, I put Liverpool at one extreme and Plymouth at the other extreme; if I said "radius," I meant "distance."

5607. That may, perhaps, account for the misunderstanding?—I meant to say that when a man wants foreign beasts for killing purposes, let him come here and buy them and kill them.

5608. Do men come up to the London market to take beasts down as far as Liverpool for slaughtering purposes?—Yes, lots every week, particularly sheep; and any amount of beasts we used to sell to Plymouth.

5609. Another objection which you have to Deptford is, because if all the meat had to be slaughtered there, there would be a difficulty in regulating the supply of meat into the market, and you might have a glut at some times and a scarcity at other times; did I correctly understand you to say that?—That is so.

5610. I understood you also to say that cattle were allowed to be kept for ten days at the Deptford Market before being slaughtered?—I believe that that is the regulation, but I am not quite certain about it.

5611. Do you not think that if a margin of ten days were allowed before cattle were obliged to be killed, with all our telegraphic facilities, by the time the trade had continued any length of time, that difficulty might be overcome, and that the market might be regulated?—No.

5612. Not by our telegraphic facilities and our being able to keep the beasts alive for ten days?—No, it has nothing to do with it. You could not stop supplies. Take Tonning, for instance; they begin and send steamers over every week, and they come whether the market is bad or good, and they bring their regular supplies and risk the market; and, in fact, if they will trade to this country they must get rid of their supplies, because they have not found another market.

5613. I understood, I do not know whether it was from you or from another witness, that there was a certain point at which the exporter had to make up his mind, according to the selling prices in

Mr. *Gebhardt.*

18 June 1877.

Mr. *Gebhardt.*

18 June 1877.

Mr. *Ritchie*—continued.

in the London market or in the Paris market, as to whether he should send his cattle to London or to Paris?—That does not refer to Schleswig Holstein; that refers to the German sheep that go to France; but the point would be Mayence or Cologne; that would not affect the Schleswig Holstein beasts at all.

5614. As far as that was concerned then they could be regulated?—That could be regulated.

5615. And you do not think that the market for Schleswig Holstein cattle could be regulated even with the facilities for keeping them alive ten days at Deptford?—No, a man would be very silly to do so, because the waste of a bullock after the journey would be so serious that he would rather kill him than keep him alive to waste him. It is not likely that if a bullock comes out of a grass field and is put down at Deptford, that bullock could maintain its weight and condition. I say as a practical man that it cannot.

5616. My contention is rather that a great many of them would probably not come until they were sent for by telegraph?—One could not carry on a trade like that; it is a moral impossibility.

5617. With reference to the question of prohibiting the importation of live animals altogether, you think that if live animals were prohibited, we should not get dead meat from the Continent at all?—No, I think that as long as they could find any other market they would not come here.

5618. It is a matter of pounds, shillings, and pence?—It is a matter of experience; but taking it for granted that they would go into this ice question, it has never been stated before this Committee that prime American meat of first-rate quality stands the journey much better than middling meat; because if you have a beast which weighs 100 stone or 800 pounds, of course that is a prime bullock; that meat is thick and well set, and will stand the journey much better. A great deal of the foreign meat would weigh 500 pounds instead of 800 pounds, and consequently the meat is thin; the flanks and the sides are very thin. The great experience has been that the American meat that has been condemned has been of rather an inferior quality, so that it would not stand the journey so well. I believe that the first difficulty and expense would be to procure ice abroad, and another great difficulty would be, that it is proved, that offal could not be sent by this process. What would the people in Tonning, where there are about 3,000 inhabitants, do with the offal of 2,000 beasts and 3,000 or 4,000 sheep a week? That offal would be useless. You say that they might adopt an ice process, how would that thin plain meat arrive here compared to fat stout beef? It would very often be in such a condition that it could not be sold at all.

5619. You think that there are two difficulties; one difficulty being the question of the offal which you think could not be brought?—I am certain that it could not.

5620. And the other being that the meat is of such quality that it would not stand the journey so well as the American meat?—That is it; and then there is the expense of the ice.

5621. In your opinion, then, I presume that this meat when it arrived here, even if it were in fair condition, would probably not be worth so much per pound as the American meat is now, because it would not be of such good quality?—It would not.

Mr. *Ritchie*—continued.

5622. Of course, in your opinion, the value of the dead meat here would not be so much per pound as the value of the live animals?—Nothing like it.

5623. So that although the mere carriage of the meat might be a little less dead than alive; yet, seeing that it would not be worth so much per pound, the cost would be very much greater to the shipper?—Yes; but I am not certain that the cost is higher from Tonning for live meat than for dead meat.

5624. Even if we were to assume that it were less, the American would still have to deduct the difference in the value of his meat, dead or alive in this market?—He would.

5625. Do you know what the proportion of the live and dead meat which is imported into London is?—No; I have not gone into the figures.

5626. You do not know how much the supply of dead meat would have to be increased to make up for the stoppage of the live meat?—No, it is a matter of calculation, but I do not know.

5627. You spoke about the cow-sheds; you object, I understand, to their being in London, because the forcing of milk produces pleuro-pneumonia?—Very often it does.

5628. Do they not force milk in the country as well as in London?—First of all, in the country they rely more upon natural food; and I do not believe that a man would send a diseased cow up to London out of the country; I think he would dispose of it in some way or other, or kill it.

5629. He would probably send it to the market where he would realise the most for it?—If a diseased cow came into London and could not go out again except for killing purposes, that cow could not do any harm; but when the seed of pleuro-pneumonia is in the cow, but not developed, that cow might, under the present system, go and be sold, and travel over the country, and do a lot of mischief.

5630. Do you know whether there is any difference between the quality of the London milk and the quality of the country milk?—I should say that the country milk must be much the better, because the cows have more natural food.

5531. Do you know of your own knowledge anything about the relative qualities of the two milks?—Yes; last week we dealt with a London dairy, and now we deal with the Aylesbury dairy, and I find the milk a great deal superior. I heard that quite accidentally last week.

5632. Does it keep as long as the London milk?—I do not know how long it keeps, but we have it every day, and it is very good, and that, I suppose, is a pretty good test at this time of year.

Mr. *King Harman.*

5633. You say that if the cattle were slaughtered at Deptford it would raise the price of meat through the country, and especially at Birmingham and the different large towns?—Yes.

5634. As a matter of fact, since foreign cattle have had to be slaughtered at Deptford, has the price been raised in Birmingham and the different large towns?—The foreign cattle which have been

Mr. *King Harman*—continued.

been slaughtered at Deptford have been very few because they have not come.

5635. Whether there have been few or many, has the price been raised?—Of course it has; if it had not been raised it would have been cheaper.

5636. Has it not, as a matter of fact, been actually cheaper?—No, I think not.

5637. Has it been dearer?—I could not tell you, because I do not deal in Birmingham.

5638. You have given the Committee evidence to the effect that if the foreign cattle are obliged to be slaughtered at Deptford, the result of that will be that the price of beef will be raised in the country, and especially in the large towns, amongst which you specified Birmingham; I ask you, as an absolute fact, whether the price of beef has been raised in Birmingham since the Order directing foreign cattle to be slaughtered at Deptford?—The foreign cattle, at this time of the year, which would have been slaughtered at Deptford, have been very few; but the experience would commence next month, when the great supply from the Continent commences. We have, of course, not had the experience of it yet, except in the last outbreak, when we were compelled to go to Odam's Wharf, or to Deptford; but next month you will see the effect, and, if the cattle cannot go to those towns, the effect will be very serious. I am speaking principally of the grass season, which commences next month, and lasts until the end of the year; and you will find that, if the Schleswig-Holstein cattle have all to go to Deptford, the price of meat in the country will be very seriously raised.

5639. Although it has not risen at all?—because the time for the importation has not yet arrived.

5640. I thought that your information to the Committee was that the stall-fed cattle had been coming in from Southern Germany for the last three months?—No; I said they had been stopped.

5641. But, if they had not been stopped, the stall-feds would have been coming from the Rhenish provinces and from Southern Germany?—But I showed from the figures that there are much fewer in those six months than there are in the grass seasons.

5642. Allowing that you showed that a considerable quantity did come in, quite enough to make a marked difference in the price, that difference would have been shown by the stoppage of the stall-feds; but that does not seem to have occurred?—We had a new supply; this has partly been counteracted by the American supply, and I believe that if the American supply had not come meat would have been much dearer. I can only answer the question as I hear, because I do not deal in Manchester and Liverpool and those places; but I am told that meat is dearer there than it is in London. Of course, I cannot give that in evidence, but it is only a statement.

5643. Have you never heard that that is very frequently the case whether there are restrictions at Deptford or not?—It might be so occasionally; but as long as there is a fair market, trade will regulate itself.

5644. Should you be surprised to hear that prime meat is frequently dearer in Manchester than it is London?—I know it is.

Mr. *King Harman*—continued.

Mr. *Gebhardt.*

18 June 1877.

5645. Then that is not in consequence of the slaughter of cattle at Deptford?—No; but when we get a large supply in the London market, we have all these buyers from every part of England; whereas if you have the cattle at Deptford they cannot buy them, and that meat must be slaughtered there, and it will go to the dead-meat market, and you do not hear of people coming from Manchester or Liverpool to buy this dead meat.

5646. At the same time you do not hear of the price of meat being raised in Manchester or Liverpool in consequence of it, do you?—I have been told that meat is dearer there than it is in London; and, on the other hand, the great supply of American meat which has come into Manchester or Liverpool has counteracted it.

5647. Then your evidence is that, supposing one branch of the cattle supply was stopped, and another did not come in, meat would be dearer than it is at present?—No doubt.

5648. That, I think, we could have found out for ourselves. You say that in the ordinary state of affairs the small buyers come in and take a great deal of inferior cattle down to the mining districts?—No, I did not say so. I said that the country buyers came in there, and at Deptford we lose the country buyers, and we lose the retail butchers from London.

5649. Did you not say that men came from a considerable distance and took inferior cattle down to the mining and manufacturing districts?—Yes, I did say so.

5650. Is it your experience that the miners and the people in the manufacturing districts are in the habit of preferring inferior beef to good beef?—My experience is that the labouring classes cannot give so much money for their meat as the richer classes, and therefore they buy the cheaper article.

5651. Have you ever heard it stated that in the manufacturing districts, until quite lately, one of the great difficulties of the butchers was to dispose of the inferior joints, because the populace of the large towns would not buy them?—I did not hear so, but I can prove, if my evidence is worth anything, what is practically the case: that I have sold generally to those butchers who come from the manufacturing and the mining districts the inferior class of animals, and that I could show by figures, if my evidence is to be believed. I tell you that they buy a great deal of the glut of the market; when I say "inferior," it is good meat, but it is merino sheep.

Chairman.

5652. What I understood another witness from Manchester to state here before was, that the manufacturing districts preferred the foreign sheep because it was a lean animal, a smaller animal with smaller joints, and they got more meat for their money?—Yes; but we make less money if we sell them.

5653. The foreign sheep, of which you are a large importer, go into the manufacturing districts on that account as against the home sheep, which are too large, and too fat, for the consumers?—Yes.

Mr. *King Harman.*

5654. I understand that to be so as regards sheep; do you consider it so as regards cattle?

Mr. *Gebhardt.*

18 June 1877.

Mr. *King Harman*—continued.

—When I talk of inferior cattle, they are good sound healthy animals, but they are not so full of flesh and fat as your best English beasts are. If, for argument sake, I sell a foreign bullock at 7 *d.* per pound, the English bullock would be worth 9 *d.* per pound; that is 2 *d.* per pound difference; this butcher who buys the foreign bullock can send his meat to those places which I have mentioned; this meat, of course, is less per pound than the English meat, and so long as you allow this meat to reach him alive he can have it; but if he cannot get it alive he cannot get it at all.

5655. Why cannot he get it dead?—Because it will not keep; at this time of the year, in hot weather, do you think that a man would come here and slaughter his beasts or sheep in Deptford Market and take it over to Wales?

5656. I do not suppose he would; but I think the buyer at Deptford might send it, certainly, to either Sheffield or Birmingham?—He would not.

5657. He has never tried?—I beg you pardon, he has tried.

5658. Should you be surprised to hear that the owners of fat stock in the west of Ireland are, and have been for some time, in doubt whether it would not pay them better to slaughter on their own premises, and to send up the carcases to Dublin, than to send up live stock?—They may have thought so, but I think they had better let well alone; it remains to be proved, at any rate, whether it would answer.

5659. You say that you would recommend that the restrictions should be so far relaxed that foreign dealers should bring in their stock, and that they would be willing to submit to a heavy penalty if they brought in infected cattle?—I did not say so; I believe I stated that a foreigner cannot bring in diseased stock at all, because by the present regulations, when they arrive, if any animal has any disease about it, the whole cargo is detained and slaughtered at the water side. I stated that I considered that not only the butchers, but all the dealers, should not buy beasts, or sheep, in Islington Market except for killing purposes, and that they should not be shown in other fairs or markets; because I believe that these middlemen and jobbers do a great deal more harm by carrying disease about than any other class of buyers. I say that what goes to the Islington Market goes, to all intents and purposes, to a fat market for killing purposes; and if a man knows that he can send no stores there without their being killed, he will not send them there; and it is very rarely that a man does send them there; I have known sometimes, when trade is bad, when a beast may be worth more for keeping purposes than for killing half fat, a man may say, "I will buy these beasts and take them to a small country market;" he takes the disease to the market, and it is carried about the country; that is a fact which has been proved many times.

5660. I think you were speaking about bringing cattle into the country from foreign ports, and you stated that if foreign dealers shipped diseased cattle they would be perfectly willing to submit to any penalty for doing so?—If they had to submit to a loss of 2 *l.* or 3 *l.* a bullock, or 4 *s.* or 5 *s.* a sheep, that is a heavy penalty. If a cargo comes here with, say, 400 beasts from Tonning, very likely belonging to 100 different

Mr. *King Harman*—continued.

people, the inspection and the examinations there are so severe, that when you look to the returns hardly any cargoes have been detained on account of foot-and-mouth disease or pleuro-pneumonia. Occasionally there has been such a case when there is stress of weather, as we have known it, and the beasts or sheep, or a whole cargo have arrived, some of the animals having symptoms of foot-and-mouth disease, but then the whole cargo has been detained. It is the interest of the exporter not to put diseased animals on board; but the veterinary surgeon at Hamburg has been dismissed by the Prussian government, as I tell you, because he did not do his duty.

5661. Still he did not do his duty, and the cattle plague came?—He did not do his duty, and the cattle plague came.

5662. In point of fact, the whole of the flocks and herds of England are at the mercy of the inspector at any German port, are they not?—No, because after the cattle arrive here they have to undergo quarantine, and then they are inspected by English inspectors; so that if any outbreak of disease happens by the time these cattle are on board, which is generally 48 hours, then there is 12 hours quarantine, which is generally extended; you may almost say that it is three days. Then the cattle are examined here very strictly, and if the inspector detects any disease the whole cargo is detained and slaughtered. So that you do not rely upon a foreign inspector, but you rely upon your own inspector.

Mr. *Elliot.*

5663. You said on Friday, I think, that many of the foreign cattle are used for ploughing and other farming purposes?—Yes, that is in Prussia and Bavaria and the middle part of Germany.

5664. Are they afterwards sent over here for butchering purposes?—They used to come here after being fattened, and they were sold here for butchering purposes.

5665. They are generally second class cattle, are they not?—They are old cattle; they are very fat, but of course they would not make anything like so much as the English cattle.

5666. Not so much as the Holstein cattle?—I do not know; they are very good meat because they are not so very old. The estates there are mostly owned by noblemen; they have large estates, and they renew their stock every one or two years; so that the oxen would not be very old, perhaps five or six years old.

5667. Do you think there are more cattle in the country now than there were in 1865, before the rinderpest?—I cannot tell you.

5668. If we got the American meat very cheaply into the London market continuously, do you not think that the poorer people would prefer taking that to taking the offal?—That all depends upon what price the poor man could afford to give for his meat.

5669. If it is coming cheaply and coming fairly within their reach, would they not prefer paying an extra 1 *d.* per pound for the American meat to buying the offal?—It has been given in evidence that the American meat cannot come below 6 *d.* per pound, and for 6 *d.* you can buy a lot of offal.

5670. Do you know anything of the Schwartz system of obtaining cream from milk, which is used in Denmark and Germany?—No, I no not.

5671. You

Sir *George Jenkinson.*

5671. You spoke of glutting the market with dead meat, and you say that would be more the effect of importing dead meat than it would of importing live beasts into London?—Yes.

5672. You said also that the surplus live beasts of London could be sent down into the country within a radius of 200 miles, and you mentioned several large towns; but is it not the fact that the American meat comes to many ports nearer those towns than London is; for instance, Liverpool would supply Manchester?—Yes.

5673. Why would you not rather supply those towns within that radius of 200 miles, such as Manchester, and so on, with the American meat which was landed in Liverpool and Bristol, rather than with the live beasts from London?—It is at their option to do so; and it appears to me, from the evidence, that they prefer live meat, because the American meat comes in in an uncertain state; and I believe that evidence has been given here that the people of Liverpool and Manchester prefer to have it alive to dead, because a man can keep his live things over for a few days or a week, or as long as he likes, but if he buys this American meat it must be consumed at once.

5674. But if it is the fact that importing live meat is dangerous to the herds and flocks of this country, would the circumstance that people prefer live meat to dead meat be any reason why the flocks and herds of the whole of the agricultural classes should be jeopardised by that means?—Yes; but I do not admit that these diseases are foreign diseases, except cattle plague, which you can protect the country from. If the foreign animals are attacked with any disease, they are not allowed to come into the country, so that I do not admit that the foreigner introduces those diseases; they are home diseases, and I think you have more in this country than we have abroad. Cattle plague must not come here at any time; and by proper management you can keep it out. If any proper regulations had been made, cattle plague would not have come the last time.

5675. It is very easy to lock the stable-door after the steed is stolen?—I suppose experience would teach us how to prevent in future.

5676. But, in point of fact, cattle plague has been imported on every occasion from abroad, has it not?—It was imported from Russia first; then you prohibited Russia altogether. This last time it was imported into England by smuggling, and by bad regulations on the other side, and I think by a great neglect on this side. I believe that the Government could very well protect itself from ever bringing cattle plague into this country again.

5677. But if the American meat is good, why should it not supply the wants of the community just as well as live stock?—I do not think you have given it trial enough. The one is a trade that it has taken 35 years to create. The foreigner has found that he has got a market here; he has imported most valuable animals, bullocks and sheep, which I have been a great medium of supplying, and he really supplies you with a lot of wholesome food. All at once you say, "I will hunt you out of the market," by compelling him to bring dead meat here which he cannot do, or by saying, "You shall send your goods to a market where there is no fair trade." If you

Sir *G. Jenkinson*—continued.

Mr. *Gebhardt.*

18 June 1877.

prefer American meat to the foreign meat give the foreigner proper notice: two or three, or four or five years; let us wait until the American meat trade has developed in the way that some people think it will. Of course I am not a prophet, and I cannot say whether it will or not; but why should you do away with a healthy and good supply of meat and substitute for it a doubtful one? I am a practical man of business and a practical farmer, and I do not believe that pleuro-pneumonia and foot-and-mouth disease are foreign diseases. If you talk about cattle plague I say you ought not to have cattle plague, because you have the assurance now of Prussia who has made this new regulation, that cattle on arriving from the Silesian frontier cannot proceed by rail, but must be unloaded and must travel on foot, I believe, 25 or 50 miles, I do not know which, and that all due precautions are taken. I believe scientific men think that it is three, or four, or five, or at the lastest period, seven days, before cattle plague develops, and I think you have every guarantee in the world against cattle plague.

5678. I think you spoke of American beef having often been sold for English beef, to the great advantage of the butcher?—Yes, there is no doubt about that.

5679. That would go to prove that the American beef was not inferior to the English beef, would it not?—I never said it was inferior; if it comes in a good state it is very good.

5680. As a matter of fact, if the American trade does not pay, it will cease of its own accord, will it not?—I should say so.

5681. And if it does pay it will continue?—Yes.

5682. Therefore, you may leave it to take care of itself, like other trades?—Of course.

5683. Why should you have artificial legislation to protect any class of trade?—That is what I do not want.

5684. You do not want it, because you want to continue live importation?—I want to leave things as they are. If the Government make proper arrangements to protect this country from cattle plague, and then let the other trade develop itself as it likes, if the foreigner finds in course of time that America can produce cheaper meat than the Continent can, he will stop out of the market. But how would you like it, if all the English goods which go to Germany were all at once prohibited, and you were told that the market was now closed?

5685. I think you spoke of the importation of dead meat, and said that it would hurt the farmer more than anyone else?—I do not see where the English farmer would find his market. If you had 7,000 carcases in London, there would not be much room for him to sell his beasts.

5686. It is your opinion that it would hurt the English farmer more than anyone else?—I think it would hurt him quite as much as it would anybody else.

5687. If that is so, and the farmers are willing to take the risk, it concerns themselves alone, does it not?—Yes, but they are not asked the question.

5688. Then you are advocating, so to say, the interests of the English farmer when you say that it would hurt him more than anyone else?—I say that the English beasts are generally better beasts than the foreign beasts, and if we get

Mr. *Gebhardt.*

18 June 1877.

Sir *G. Jenkinson*—continued.

glutted with one class of meat the other class will not come.

5689. You said also, did you not, that to continue to import the American meat would raise the price of meat all over the country?—No, I did not say that exactly.

Chairman.

5690. I understood you to say that if this change which is proposed took place, the prices would fall in London and rise in the country?—Yes, for a certain class of meat.

Sir *George Jenkinson.*

5691. That would be good for the farmer, would it not?—It is a question, then, whether the farmer would like to sell his meat at the same price.

Chairman.

5692. I understood you to say that it would tend to lower the prices generally, because if you lost what is at present your best market, viz., the Islington Market, the prices all over the country would fall as the result of that; and if you got the London market, you would so reduce the prices, not only in the Deptford part of it, but in the Islington part, that you would thus reduce the production of the home-stock.

Sir *George Jenkinson.*

5693. You stated that the importation of dead meat would hurt the farmers more than anybody else, and then you stated that it would tend to raise the price of meat all over the country; and again, you said that it would very much injure the foreign cattle-dealers: I do not see how you can reconcile a gain to the farmer on the one hand, by the rise of price, and a loss to the farmer, on the other hand, by the importation of live stock?—My meaning is this: If you bring 4,000 foreign beasts to kill them at Deptford during the grass season of the year, and you bring 3,000 American beasts, those 7,000 carcases of beef would be all in London, and would have to be consumed in London, because people do not attempt to take this dead meat down into the country, and the result would be that the English producer would suffer.

5694. That is the affair of the farmer, is it not?—I only say that it is my opinion that the English farmer would lose his market, because if we have 7,000 carcases of beef there is no room for any more.

5695. But he can sell at Birmingham, and Liverpool, and Bristol, and Manchester?—Yes, if he can find customers.

5696. You say that under the restrictions on the admission of foreign cattle the American meat trade has kept the prices down?—Yes, of course it has.

5697. Then where have they risen?—I do not know that they have risen at all.

5698. You stated, in answer to an honourable Member, that they had risen in Birmingham and Manchester?—The prices are always higher there than they are here, or else they would not come here to buy.

5699. If it is always dearer there, the dearness is not caused by the importation of dead meat, is it?—But they can come and buy our stock at the Islington Market, which they cannot do at Deptford.

Sir *G. Jenkinson*—continued.

5700. But you said that it was the importation of American meat which kept down the prices; if that is the case, it must be good for the whole community?—Of course it is, if it comes sound.

5701. You have expressed a very strong opinion about the importation of dead meat not succeeding, because of its uncertainty; have you ever read a report from a Departmental Commission in 1869, the Commission consisting of Arthur Helps, Esq., Frederick Outram, Esq., T. H. Farrer, Esq., and Dr. Alexander Williams, and being appointed to consider the powers entrusted to the Privy Council by Section 64 of the Act of 1869?—I know nothing about it; I have never read it.

5702. If, with regard to the conveyance of dead meat by sea from foreign countries into the United Kingdom, they expressed in that report the opinion that no legislation would overcome the difficulties attending the transmission of dead meat by sea, do you think that was a premature opinion, and one which was not justified by facts?—The importation of dead meat has not taken place to any extent, except from America; otherwise the importation of foreign meat has been very moderate indeed; it has, to a great extent, failed.

5703. But, in point of fact, the importation of dead meat from America does succeed, does it not?—I think partly so, and partly not.

5704. I think you stated that there was no importation of store stock into London; are there not a number of dairy cows brought into London which are imported from abroad?—Yes, they might be imported to another place; they need not go to the Islington Market.

5705. But, in point of fact, are they not imported and sold in London?—Yes, they are.

5706. Then what are they but stores?—They are not stores; they are milch-cows for the London dairies.

5707. They are not for slaughtering?—No.

5708. All stock bought for home use you would call store stock, would you not?—No, I would call store stock young stock bought to graze for fattening; and the other stock I would call by their proper name, "dairy cows."

5709. The supply of milk to London is very important, is it not?—Yes, very.

5710. And therefore that supply of dairy cows is very important for London, I presume?—I do not say that they should not import dairy cows, but I do not think they should go to a fat market.

Mr. *French.*

5711. You spoke a few minutes ago with regard to bullocks being employed for ploughing in Germany; did I correctly understand you to say that the farm-work in Germany is done exclusively by those animals?—In some parts it is very nearly so.

5712. In answer to a question which was put to you before the Committee in 1873, you said that the small farmers rear the bullocks and break them to the plough, and that when they are two or three years old they sell them; do they sell them then for work at the plough, or to be fattened?—For the plough.

Mr. *Anderson.*

5713. You do not believe in foot-and-mouth disease and pleuro-pneumonia being imported diseases?—I do not.

5714. You

Mr. *Anderson*—continued.

5714. You think that they are indigenous in this country?—Yes.

5715. And therefore, whatever regulation which we make, or whatever attempts may be adopted, to stamp them out in this country, we shall always be liable to their recurrence?—That is my idea.

5716. I gather from your evidence that your general opinion is that the importation of dead meat is a very good thing, and has benefited the community considerably, but that it would never do to trust to it entirely?—Yes, that is my opinion.

Sir *Rainald Knightley.*

5717. You said on Friday, in answer to a question which was put to you by the Chairman, that the great objection to importing dead meat from Germany was that they had got no ice?—Yes.

5718. Do you really mean seriously to tell the Committee that the climate in the north of Germany is so sultry that water does not freeze there in the winter?—I do not believe that as a fact; in many winters they have got sufficient ice to fill their ice-cellars, even for ordinary purposes.

5719. Have you ever known a winter in the north of Germany in which there has been no frost?—I have known winters in which the frost has been very slight. This last winter I do not believe that the navigation of the Elbe has been stopped for one week, and that is a pretty good criterion.

5720. Surely when there is plenty of ice (and there is almost always ice in the north of Germany) there can be no difficulty in storing it; it is not an expensive process?—They must have it first before they can store it. Last winter was a very mild winter; and I believe that if they ever attempted the process of bringing the meat here fresh from Germany in the American way, they must import ice from Norway and Sweden.

5721. You said just now, in answer to an honourable Member, that the great difficulty that you had was in dealing with the offal, inasmuch as there was not a sufficient demand for the offal abroad?—There is not.

5722. Were you in the room the other day, when an American witness stated that they utilised the heart and the liver, and all the portions that were good for human food, by turning them into bolognas, and the fat into tallow-candles, and the hoofs and the horns into glue, and that they in fact utilised the whole of the beast?—Yes, I was.

5723. If they can do that in America, cannot they do it in Germany?—No; what you could do in New York, which is a very large town, is quite a different thing from what you could do in Tonning, where there are only about 3,000 inhabitants.

5724. But might not those things be utilised and converted into exportable commodities, as the American witness described to us?—I do not know exactly what he said about it; but I can only say that in a small place like Tonning, where there are only about 3,000 inhabitants, I believe that the offal would be almost worthless, because they could not consume it, and they cannot export it.

5725. Could they not export it in the shape of tallow-candles and bolognas?—Fat and hides

Sir *R. Knightley*—continued.

you can utilise everywhere; but, taking what we call offal (that is, the heart, the liver, the tongue, the tail, and the kidneys), what could you do with all this stuff in a little place like Tonning? Yankees can do a great deal more than other people, but I do not think that our people could do it.

Mr. *Gebhardt.*

18 June 1877.

Colonel *Kingscote.*

5726. I suppose you are aware that in the North of Germany and Denmark the dairy-farmers use ice to a very large extent for cooling their milk?—Yes.

5727. Do you not think that they might use ice, if they were pushed to it, for cooling meat as well?—Yes; but what a much less quantity of ice they would require to cool milk. A steamer from Tonning brings 500 live bullocks; if you put 2,000 quarters of beef into that steamer, what a lot of ice you would require.

5728. Very much less in proportion; I believe that a ton of ice will bring 10 carcases?—I have heard that each carcase requires half-a-ton of ice; I do not know that it has been stated in the room here.

5729. But ice could be got very cheap, if the trade once began there, could it not?—I do not say that it is impossible that it could be done were they obliged to do it; but it is a matter of price, and it is a question whether it would answer.

5730. One of your chief reasons for saying that the dead meat cannot supply the metropolis is that when a cargo comes in it gluts the market, and there is no regular supply; but are you not aware that they have a depôt already, and intend to have others; and likewise that a witness before this Committee stated that the steamers were going to be fitted up in compartments, so that they need not open them all at one time, and that therefore when the dead meat comes over it will be supplied to the market as the market requires it; if they carried out that system, would not that answer your objection?—No, because, first of all, I like to act upon proofs, and this has not been proved. But supposing that the importation of foreign cattle that we have hitherto had were to continue, that is to say, 4,000 a week, and supposing that the importation of American meat should continue at the rate of 3,000 carcases a week, it would not be a sudden glut, it would be always a glut; there would be considerably more meat here than would be consumed, and consequently one trade would go against the other, and they would be both ruined and would both cease. If you made a law to say that all foreign beasts should, after the 1st of July, be killed at Deptford, supposing the American supply to continue at the same rate as now, you would get a glut of meat in London that you could not sell, and the price would be so bad then that neither trade could stand it.

5731. That would soon regulate itself, would it n ot—No, it would not; a glut in London would deprive the country buyer of cheap meat; as long as it suited the foreigner to send his meat here there would be a glut.

Mr. *Arthur Peel.*

5732. What country do you look to in the future as the source of our supply of live cattle?—In the summer you look to Schleswig-Holstein as one great source of supply, and to Holland.

Mr. *Gebhardt.*

18 June 1877.

Mr. *Arthur Peel*—continued.

5733. But not to Germany?—No, not at this time of the year.

5734. You think that Germany imports meat herself?—Germany imports in the grass season a great many Schleswig-Holstein beasts to use in Germany Proper.

5735. France is not an exporting country, is she?—France exported a great many beasts from Normandy to this country as long as they could go to the Islington Market; but the moment France was compelled to go to Deptford with those fine great beasts, making from 30 *l.* to 40 *l.*, they discontinued sending. There is no law to prevent France from sending but they have not come.

Chairman.

5736. There is a law to prevent France now, at least it is revoked on the 30th?—Yes, but there was not last year, and they did not send a bullock. They might have sent, but they did not because the price did not pay them.

Mr. *Arthur Peel.*

5737. As a matter of fact France is importing largely now from Germany, is she not?—Yes, particularly sheep.

5738. I think you stated that when the French frontier was opened we lost half our supply?—Yes.

5739. Then you do not look to Germany for our supply for the future?—Yes, I look to Germany for the first six months in the year, particularly for our sheep supply.

5740. Do you think that she would be a continuous exporter to this country?—Yes, I think that the exportation from Germany, till the last Order in Council, has been increasing very considerably.

5741. So long as she closes the Austrian and Russian frontiers, I suppose she would not have much to spare?—She does not import sheep from those countries, but only cattle. For the five months of the grass season I look to Schleswig-Holstein as one of the great supplies to this country for meat.

5742. Under those circumstances do you think that we shall have enough supply exclusively of America to meet the wants of the country?—We have always had enough up to last year, because this American trade is quite an additional supply.

5743. Do you not think that the competition will be rather between American dead meat and American live meat, than between American dead meat and continental live meat?—I think that the Americans will try to bring their meat alive in preference to bringing it dead.

5744. Do they bring any live cattle to England from the River Plate?—I think that there have been one or two trials made; but I think that the great importation of live cattle now comes from the United States and from Canada.

Mr. *Chaplin.*

5745. I understood you to say that you have lately had less cattle than usual?—Yes.

5476. And that that is in consequence of the recent restrictions upon the importation of live cattle from the Continent?—Yes.

5747. I suppose that you would be glad to see those restrictions removed or relaxed?—Of course, the moment it could be done without danger, we should like to see the restrictions relaxed.

Mr. *Chaplin*—continued.

5748. It would tend to improve your business, I suppose?—Yes, of course.

5749. I understood you to say that if the importation to this country was limited to dead meat alone, the trade could, in your opinion, scarcely be carried on at all?—Yes, that is my idea.

5750. You say that if it was limited to dead meat, the trade in this country could not be carried on; do you think that it would be so if the present system of importing dead meat from America was so nearly perfected that we could always rely on a regular supply of meat in first-rate order?—Of course if the meat could always come in first-rate order, it would be a certain supply; but as long as there are these doubts about it, I do not think it would be right to rely upon it. It is a question which I could hardly answer, because it depends upon whether the people who like to buy live animals would like to buy dead meat; and that remains to be proved. I should think hardly anybody could answer that at present, until it has been put to the test.

5751. But I understood you to say that if the import into this country was limited to dead meat, you could not carry on the trade?—I do not believe that a dead meat trade altogether would answer, because it has been proved that if the American meat arrives and can be consumed at once, all right and well, but if it is not consumed directly, it spoils. They must find out a means to preserve the meat in a sound state, because when a man buys his stock alive, he can keep it and kill it when he requires it, but if he buys it dead, and knows that it will deteriorate, he will give more money for it alive.

5752. Are you aware that we have had evidence that an unlimited supply of dead meat could be delivered to this country from America, in perfect order, at 6 *d.* per lb.; and not only that, but that meat delivered in that perfect order at Liverpool, would travel further and keep better than meat killed in England?—I think that it would be very unwise to legislate on such a matter before you have proof of it.

5753. Assuming that that turned out to be correct there would be an absolute impossibility in carrying on a trade limited entirely to dead meat, would there?—Yes, I see great objection to it, because I believe that in a great many places it would not answer; but a man would prefer to have his meat alive to having it dead, even if he could not get it without paying a higher price for it.

5754. In reference to an answer which you gave to the Member for Sheffield you said, as I understood, that the effect of slaughtering all the live cattle at Deptford would be temporarily to make the meat cheaper in London, and to raise the price at the great centres of industry?—Yes, because we have a lot of meat at Deptford which they would be glad to get, and we have no sale for it.

5755. Do you know what is the average price per pound of the meat which we derive from the cattle that are imported alive from the Continent?—I should say that the price would be from 7½ *d.* to 8½ *d.* per pound.

5756. And

Mr. *Chaplin*—continued.

5756. And the price of American dead meat, I understand, is about 6 *d.* per pound when it is in good order?—Yes, it is sold for more than that. It appears from the evidence that 6 *d.* is the price at which they can afford to send it, but I have known it make 7 *d.* or 8 *d.* per pound.

5757. Not less than 6 *d.*?—I have known it to make 1½ *d.*

5758. Would the price average 6 *d.*?—No, I do not believe that it ever made 6 *d.* on the average. My firm opinion is that it has been a losing game.

5759. It may have been a losing game to the exporter but not to the consumer?—No; I mean to the people who embark in it, but I have no evidence to give upon that point.

5760. You consider it to be better than beef from the Continent?—I consider the bulk of the American beef of a better quality than the bulk of the Continental beef. If you could get it in the same condition I should say that the American meat has the advantage.

5761. It has been proved that the American meat travels perfectly well to London, and that it pays the exporter to be sold at 6 *d.* per lb.?—Yes, that has been in evidence.

5762. Then why cannot it be delivered to Birmingham?—It has been I believe; they have had some there, but I do not think that they are very fond of it.

5763. We arrive at this, do we not; that American dead meat can be delivered at Birmingham at 6 *d.* per pound, and the foreign cattle from the Continent cannot be sold there at less than 8 *d.* per pound?—I did not say so. You asked me what it makes, and I said before in my evidence that I believed that they could afford on the Continent to go on breeding for a time, even though prices by degrees should diminish, just as the English farmer if he cannot get 6 *s.* per stone must take 5 *s.*, and that would not stop his breeding. Thirty years ago what is now worth 6 *s.* a stone was not worth 4 *s.*, so that the trade must regulate itself; but these rapid revolutions upset any trade.

5764. Do you suppose that meat from the foreign live cattle could ever be sold at a profit to the exporter in those centres of industry at 6 *d.* per pound?—Yes, it was sold 30 years ago.

5765. I am not speaking of 30 years ago, but of the present time?—If it took 30 years to go up it might take 30 years to go down, because in the case of anything which you like to mention, the demand and supply regulate the price, and just as the foreign producer would be satisfied or must be satisfied if he gets less money, so would the English producer. It is a matter of trade. I do not say that if they could not get more than 6 *d.* per pound for it abroad they would continue to send it; but it would not be done in one year or one day. Trade regulates itself in that.

5766. At all events, at the present moment, I do not understand that you believe that it would pay them to export their foreign cattle to be sold at 6 *d.* per pound?—No; but if they had the cattle on hand, and had no other market, they would be obliged to send them.

5767. But if 6 *d.* per pound were the most they could expect to get for it they would seek for another market?—They would try to find other markets in the future.

5768. American dead meat could be delivered in Birmingham to pay them well at 6 *d.* per pound, could it not?—It may or may not pay them; but, take it for granted that 6 *d.* per pound pays them; I do not believe that it does.

5769. So that it appears that we can have an unlimited supply of American dead meat at 6 *d.* per pound at those centres of industry, and you think that if 6 *d.* per pound was all that could be obtained by the exporters from the Continent, they would seek another market?—It would be better to leave the trade to find it out for itself.

5770. I wanted to know what your opinion was about it?—My opinion is, that if you give the trade a fair chance, letting the American meat come dead, and letting the foreign Continental meat come alive, then the buyer will find out which suits him best; whether he can give more for the foreign or the American meat; and if it does not pay the foreigner to come, he will find out other markets; but if you prohibit this live trade on a sudden, and if you make the foreign trade totally a dead-meat trade, let the foreigner know, and then he must do the best he can.

5771. Do you know what the average price of meat in Birmingham is at present?—I do not.

5772. You do not know whether it is more or less than 6 *d.* per lb.?—I should certainly think that it is more, because they would not come here and buy the sheep if it is not more.

5773. If they can obtain dead meat from America at that price, I do not see how that is consistent with your statement that to prohibit the importation of live cattle, or to insist upon the slaughter of it at Deptford, raised the price of meat in Birmingham?—It is because they do not like the article. We have not had a Birmingham man here, but we have had a Manchester man, and a Liverpool man, and they say that they do not like the meat, and that they could not deal in it.

5774. Are you aware that according to some of the evidence that we have had, the American meat is excellent?—Yes; I know it is if it comes in good condition.

Chairman.

5775. You think that the Birmingham men are considerably sharper than the London West End butchers, who have been, according to the evidence, dealing in this American meat for some time?—Of course, butchers do not put the name on it, and say it is American meat; and as long as it does not smell, it is very good meat.

5776. You think that we are so little fastidious in this town that we take it as English meat, although they will not at Birmingham?—That is so.

5777. You wish to represent to the Committee that if this American meat is to form the principal portion of our meat consumption in this country, it should do so by testing it in competition with the other trades?—That is it; give it a fair trial.

5778. And if it can be sold so good and so cheap, it will eventually establish itself?—It may be so.

5779. I suppose you are aware of the very large increase that was pointed out to us in the import from America, even up to the last few days?—Yes; of course the prohibition of foreign

Mr. *Gebhardt.*

18 June 1877.

Chairman—continued.

beasts from Germany, and their not being in the market, made it a better market for the American beef.

5780. Whilst nearly 18,000,000 lbs. came over in 1876, 17,685,000 lbs. came over in the first four months of this year from America, showing an enormous stride in the importation?—Yes.

5781. And having come over, as you say, because there was a market, it may continue to find a market as against the foreign import?—I have not the slightest doubt that if it pays them they will try to improve the trade.

5782. You have stated that the first effect of this glut in the market would be a reduction in the price of the foreign meat?—Yes.

Chairman—continued.

5783. I think you also stated that it would be sometime before the foreign supply would totally cease under the conditions of its being slaughtered at Deptford, but that it would diminish year by year for some time before it finally found its way into other markets?—Yes.

5784. During all that time, if the American meat still held its own, you would get a general reduction in the price in London?—Yes.

5785. That would be a great benefit to the consumer, would it not?—Yes, for a time.

Wednesday, 20th June 1877.

MEMBERS PRESENT:

Major Allen.	Mr. Elliot.
Mr. Anderson.	Mr. French.
Mr. Assheton.	Mr. King Harman.
Mr. Jacob Bright.	Colonel Kingscote.
Mr. Cameron of Lochiel.	Mr. M'Lagan.
Mr. Chamberlain.	Mr. Murphy.
Mr. Chaplin.	Mr. Pease.
Mr. James Corry.	Mr. Arthur Peel.
Mr. Dease.	Sir Henry Selwin Ibbetson.
Mr. Wilbraham Egerton.	Mr. Torr.

SIR HENRY SELWIN IBBETSON, BART., IN THE CHAIR.

Mr. MARCUS POOL, called in; and Examined.

Chairman.

5786. I BELIEVE you are a Cattle Salesman in London?—I am.

5787. Your business is principally connected with the Deptford Market, is it not?—Both with the Islington and the Deptford Markets.

5788. You can, therefore, speak generally with regard to the sale of cattle at those markets?—I believe I can. If you will permit me before giving my evidence, I would say that I have been requested by Mr. Swan, of Edinburgh, to state, which in the hurried manner in which he was examined for want of time he omitted to state, viz., that the number of cattle which he sold last year was 650 oxen per week and 3,400 sheep, out of which only 20 per cent. were foreigners; and, therefore, his interest was more with the English trade than it was with the foreign trade. He desired me to state that if you will receive it.

5789. Mr. Swan wishes that put in evidence, because the impression might have been left upon the minds of the Committee from his examination that he was interested in the foreign import?—That he was more interested in the foreign import than in the home trade.

5790. Let us take the case of the Deptford Market first; will you describe to the Committee the process that goes on in that market, and the supply upon which you are dependent there?—The supply of the Deptford Market, in comparison with the London market, from foreign parts, has certainly to a very great extent diminished.

5791. Do you mean since the establishment of of the market?—Since the establishment of the market. I have not the slightest doubt that if foreign cattle continue to be sent to the Deptford Market, the supply will be still smaller, because they do not get a fair competition of the trade with reference to the small butchers; what we term retail butchers in the trade, who are generally unable to attend that market.

Chairman—continued.

5792. Can you give the Committee any figures showing that, as you have stated, the trade has fallen off in the Deptford Market?—I am not prepared with the figures, but I believe, if I am not mistaken, you are in possession of the figures. We know that the importation has not been so large, and particularly from Holland, and also from France.

5793. At present that importation, I suppose, would naturally be diminished, in consequence of a large number of German cattle having been absolutely prohibited?—I am speaking now with reference to the Dutch and French cattle. Of course the German cattle, of which we used to have a fair supply every year, have been prohibited, but at the same time the Dutch and the French cattle have been prohibited.

5794. You state that the trade at Deptford has decreased, but that, speaking of the last few months, a certain portion of that decrease may be attributed to the fact of the German trade having been altogether prohibited?—No; it has nothing to do with the German trade; it is only for want of buyers; we do not meet with fair competition.

5795. I am afraid we do not understand each other; what I meant was that if the German cattle were added to whatever came from France or other scheduled countries, and were slaughtered at Deptford, then, as soon as the German cattle were absolutely prohibited, you naturally lost a certain portion of your supply?—Yes.

5796. And that might account for the fact of the recent diminution of the Deptford Market?—That might account for the total number; but it will not interfere as regards the number of buyers that we have to depend upon.

5797. Has the number of buyers steadily diminished, notwithstanding that there is a large supply in the Deptford Market?—Whatever quantity we have, I do not believe that the number of buyers has at any time exceeded 30 butchers,

Mr. *Pool.*

20 June 1877.

Chairman—continued.

butchers, principally belonging to the wholesale trade, making their purchases in the Deptford Market; whereas, if we were in the London Market, we should have the assistance of perhaps as many hundreds.

5798. And that is to be attributed to the fact that it does not pay the retail butcher to keep a slaughter-house at Deptford?—Certainly.

5799. And that, consequently, the trade is limited to those butchers who have their business and their slaughter-houses at Deptford itself?—Yes.

5800. And that, you state, has reduced the number of butchers since the starting of the the market?—We have not had fair competition of the butchers, because the retail butchers have never attended the Deptford Market; we have always been in the hands of a few buyers, which has tended to decrease the trade.

5801. As it is limited, they can dictate their price?—They can do so as a rule, and particulary in a bad market; we are in their hands.

5802. That you do not find to be the case in the Islington Market; there, a large number of men, I suppose, purchase for private slaughter-houses throughout the town?—Yes.

5803. And you would represent to the Committee that that gives a better trade than the limited competition which exists at Deptford?—Certainly.

5804. Has that limited competition at Deptford at all influenced the number of cattle that have been sent over to this country from countries that had to send to Deptford Market?—Certainly I think it has, and I think it will do so more if it continues.

5805. What countries have diminished their supplies in consequence?—I have not the figures before me, which I believe you are acquainted with, but we have the principal supply at the Deptford Market from France and Holland, Germany having been entirely excluded. Of course the prices and the markets vary very much, and in consequence of the Continental exporters not having free trade to send their cattle to the Islington Market, and being compelled to send them only to the Deptford Market, they cannot send their usual quantity from France and Holland.

5806. From Holland has there been any great falling off in the supply?—I believe so.

5807. You cannot speak as to the figures there?—I believe the figures will prove that.

5808. France never sent us very much cattle, did she?—Yes, they have sent large quantities at times to the Islington Market when they could come to the Islington Market. I have had as many as 200 and 300 in one day myself for sale.

5809. Was that a constant supply?—Generally.

5810. But you are not able to give the Committee the number of cattle that came in the year when they went to Islington, showing the way in which that number has decreased since they have been restricted to Deptford?—I could have done so, but I did not think it was requisite, as I heard you were fully acquainted with the figures.

5811. We have had no figures with regard to the cattle imports from France or from Holland; but you tell the Committee that, from your experience of both markets, the diminution in the supply from those two countries has been very considerable?—I believe so; and it is not only a considerable diminution, but, I think, it will fall off more than it has done, and that they will find other markets.

Chairman—continued.

5812. You cannot give us, I suppose, the present supply from those countries to the Deptford Market?—It is nominal; not so many as one salesman used to have consigned to him to sell in one day. I believe there are only 28 head of cattle coming to the Deptford Market tomorrow from Holland.

5813. At present, you say that the supply from those countries is merely nominal?—Yes.

5814. Can you tell us how this diminution in the supply has affected the price to the consumers in London?—I do not think it has a material effect upon the prices; that is principally due to the importation of American meat.

5815. You state to the Committee, that the absolute prohibition of the German cattle, and the restriction which the slaughter at Deptford has produced on the French and Netherlands supply, have not been felt in the price of meat, to the consumer here?—I do not think it has, as I say, on account of the importation of American meat

5816. You consider that the American meat has filled up the gap, which otherwise would have been created by the loss of the foreign import?—No doubt the importation would have been increased, if they had a fair open market. I do not think that the increase of supply would have been likely to have been sent to the Deptford Market.

5817. What I want to arrive at is, your opinion on this point; whether the American meat has filled up the gap which was produced, either by the restrictions as to slaughter at Deptford, or by absolute prohibition upon the foreign importation?—It has to a certain extent, and I believe that its having come, has been a very great boon to this country.

5818. And to such an extent that the prices have not risen to the consumers in London?—I believe they have not.

5819. Supposing that the foreign supply had been, as you suggested it ought to have been, free, and that it had come in at a time when, as you say, the American supply has filled up the gap and satisfied the wants of the people, because the prices have not risen; what would have been the effect upon the London market, if both those supplies had been competing here?—The prices would naturally have been lower still.

5820. Under those prices, would the foreign trade have come here?—I believe that the foreign trade would continue when they can compete and have an open free trade. I do not think that they intend to send their stock, but they will try to find other markets.

5821. Following that out a little further, you say that if it was a free market, and there were open competition, you believe that they would still send; but the price of the American meat, at which it can be sold in London, has been represented to this Committee to be 6*d.* per pound; if the glut in the market, as you described, reduced the price, would the effect upon the foreign trade be such as has been described by previous witnesses; that is to say, to stop it, and throw the foreign trade into Paris, Berlin, and other capitals?—That

Chairman—continued.

That is in reference to the question of the importation being continued to Deptford.

5822. No; I am asking you, with regard to your proposition, that the foreign trade should be free, and should come into the market without restrictions from those countries; you have admitted that the American trade has filled up the gap which was made by this trade being driven out of the market by restrictions; if they had both been in the market, would not the effect have been the glut which other people have described as absolutely likely to drive the foreign trade away from this country?—I do not believe that there would have been a glut. I believe that the prices would not have been so high as they are at the present moment, if both quantities had come in one open market together.

5823. If they had come both in one open market together, and the American meat had been selling at 6 *d.* per pound, would not the effect of the glutted market have been to bring down the foreign meat to the same level?—It would, in one sense, but that is, providing that the American meat came in good condition; of course that is the principal question.

5824. But you admit that, even with the American meat in the condition in which it has come over, there is some portion of it good, and some portion of it in an unsatisfactory state; still the markets have been properly supplied, and the price has not shown any lack of supply in the meat markets?—No; but you must understand that the British farmers have received the benefit of that, because they have got a higher price for their article in consequence of the supply not having been so strong; and consequently, if the two supplies had been together, naturally the prices would have been lower.

5825. Unless you wish to correct the first part of your evidence, I do not think that it will stand, because if those prices have not gone up to the consumer, I suppose the prices have not gone up to the seller. The butchers have been able in maintaining their prices to maintain the prices to the farmer; they have not increased those prices, or else they would have increased the prices to the consumer?—The prices are certainly higher now for the English cattle than they have been for some years past. One must have an effect upon the other. If the importation of both live cattle and dead meat are of a large quantity, naturally the prices would come to an average.

5826. But we cannot blow hot and cold; we cannot say that the price has not risen, and yet say that the price has risen; I understood you to say that during the time of those restrictions the price had not risen to the consumer, and you account for that by saying that the American meat has filled up the gap which was made by the withdrawal of the foreign supply?—Yes.

5827. Then, supposing that your wish with regard to the foreign trade had been carried out, we should have had during this winter the American meat and the foreign supply; we should then have had the market, as other witnesses have described, glutted, which would have reduced the price all over the country, and would have driven the foreigners out of our markets?—No, I do not think so.

5828. They say that it would have driven them out of our market, but with that you do not agree?—I cannot say that it would have driven the foreigners out of the market, because they look for a fair competition.

5829. But they would have to compete with the American meat at a price at which it has been stated that the foreigner could not send his cattle over here at a profit from abroad, from France, from Germany, and from the Netherlands; it has been stated to us, that if the price of foreign meat was 6 *d.* per pound, the effect would be to drive the foreign animals into Paris, Berlin, and other markets?—Very probably it would. If the prices were higher on the Continent than they are in London, naturally they would, and the Americans would not send their meat if the prices were lower here than elsewhere.

5830. Then as you admit that the trade has been amply supplied by this American meat; I should like to know why you think that there is such an absolute necessity for the continued free import of foreign animals if the markets are sufficiently supplied, and if a larger supply would so glut them as to drive away the trade?—I believe that there is certainly a necessity for a free import, because otherwise the farmers on the Continent would diminish their stock, and go back to their former mode of farming their farms as they did some 20 or 30 years ago. I remember the time when the importation from Holland was only 500 cattle a week; I remember the time when there were only a few head of cattle from Tonning, whereas we have now several thousands, and, consequently, those farmers would certainly go back upon the old principle, and it is my firm belief that in course of time we should not receive any cattle at all from many parts of the Continent.

5831. But our supply to the consumer in England would be sufficient and satisfactory, because the gap would be filled by the meat which has filled it during the last few months?—No; it would certainly diminish. If the farmers went back to the old principle, and did not produce the quantity of stock which they at present produce, the importation would be smaller; and in what position would you be in the event of the American prices getting higher, or the market getting lower in London, because then they would naturally also cease to send?

5832. If what you suggest as a possibility happened, viz., that the American trade, finding that we are dependent upon them, raised their prices or refused to send meat over, prices would naturally rise in this country from the 6 *d.* to which they have been reduced by the American trade?—Certainly.

5833. That being so, the prices having gone up, would not the supply from abroad which had been taken from us to Paris and Berlin, return here in consequence of its being a good market again?—By that time probably the farmers on the Continent might have reduced their stock, and might not be in a position to send you the cattle.

5834. That is supposing that they have no other outlets for that stock than Great Britain?—Supposing that they have no other outlets than Great Britain for that stock, or supposing that France or any other country would not suit them, they would naturally decrease their stock, and farm, as they did 30 or 40 years ago; and by that time very probably there might not be the

Mr. *Pool.*

20 June 1877.

Chairman—continued.

the stock in hand which is required for this country.

5835. I should like you to describe to the Committee why you believe that this foreign import is required for this country, when you state that it has practically ceased, and become nominal, and that, notwithstanding its having become nominal, the consumer has not suffered?—Because the supply in this country has diminished; I am a farmer myself, and I am a breeder of stock, but at the same time it is my firm opinion that if the British farmers would have done the same as they have done on the Continent, and increased their number of stock as the foreigners have done, naturally we should not be dependent upon the importation either of dead meat or live animals into this country from foreign parts. But the British farmers have found a better mode of paying their rent than breeding cattle.

5836. Do you mean by growing corn?—By growing corn and other produce, whatever would pay them best.

5837. Then, as a farmer, you do not dread these diseases as some farmers do, and you have not yourself decreased the breeding of stock on your farm in consequence of them?—I do not think there is any more dread as regards the disease than as regards anything else, because I do not think that even by prohibiting the importation entirely you will prevent the outbreak of disease taking place in this country, inasmuch as you cannot prevent any epidemic breaking out among human beings. I do not think that it would have any influence whatever as regards the stopping of diseases.

5838. Then you do not think that the farmer, if he was secure in his own mind as against what he believes to be a danger, that is to say, the importation of disease, would turn his attention, as he formerly did, more to breeding than to tillage?—I cannot say whether he would or not; they have had plenty of time to do so for the last 20 or 30 years if they felt so disposed; but I do not think that we ought to run any risk of any diseases, because I think that any country which cannot show a clean bill of health should be entirely prohibited, but that those which are clear and healthy ought not to have any restriction put upon them, and that their cattle ought to come to an open public free trade market.

5839. You are not afraid of the market being glutted by such an enormous supply as you have described, with free import of live cattle from abroad, and dead meat from America?—Certainly not.

5840. And you consider that the import of foreign meat is necessary for our supply, I suppose principally because of the danger of depending upon one string to your bow, the American one?—If the restrictions continue, I cannot say what might take place. As I have already stated, there has been an increase of cattle by so many thousands in various parts of the Continent, and consequently they might, perhaps, ultimately diminish the supply.

5841. But supposing that they diminished the supply, you would admit, would you not, that if that supply was made up from another quarter, the diminution would be immaterial?—I do not know what other quarter it could be supplied from.

Chairman—continued

5842. There is the dead-meat supply from America?—But that might cease. We have at the present moment the American supply to fall back upon; but I think I am in a position to give you a statement as regards my experience as I have something to do, or had something to do, with the American meat, and also with the sale of live cattle from America. It is my firm belief that the prices in America will increase until they are as high in that country as in any other country. Then, again, there is to be taken into consideration the present general state of affairs in reference to the business being so unfavourable. The freights are very low from America; the general freights from America are now only about 30 *s.* a ton for dead meat, and for live animals the same. The freight, in 1873, was 50 *s.* a ton. If the freight goes up, and if the prices there go up, we must naturally expect that the importation from there must cease, unless prices should rise in England.

5843. Then it comes really to this, that the American price at present would, from its being so low, drive the foreign import out of the country?—There is not the slightest doubt that they would go to better markets if they could find them.

5844. But the price rising in America, would bring back that foreign import into this country, unless what you have suggested occurred; viz., that the farmer in the meantime had turned his land to some other purposes?—Yes, and reduced his stock.

5845. You mentioned just now that you are acquainted with the American meat trade?—Yes.

5846. You seem to be a universal genius in trade?—Yes; I have had upwards of 30 years' experience, and I think that I can give you a little information which might be of some service to you.

5847. I should like exceedingly to learn how you have been connected with the American dead-meat trade, and what conclusion you have arrived at from your experience. Have you yourself imported largely?—I am only a commission salesman, and as such, consignments have been made to me, both live and dead.

5848. Have you had consignments of dead meat made to you from Liverpool, or from what part?—From America direct, *viâ* Liverpool, and also *viâ* Southampton.

5849. The consignments arrive, I suppose, both at Southampton and at Liverpool, brought over under one of these refrigerating processes?—Under one or the other of them, but upon different principles, I believe.

5850. And as such they arrive at Southampton or at Liverpool, cooled down by the process which has been described to the Committee?—I believe so.

5851. Have you any knowledge of the condition in which that meat arrives at those ports?—Yes; because it has been my interest to study it; I have gone aboard before any of the refrigerators have been opened, and I have noticed the condition in which the meat was.

5852. Will you tell the Committee what the process is that those two lines adopt; whether it is the dry-air process, or whether it is the process of ice being driven through pipes?—As regards the dry-air process, I am sorry to inform you that I have had two consignments from a firm of

Chairman—continued.

of the name of Lehmann, Samuels, and Brother, who are large butchers in New York, who export both meat and live cattle. They tried the experiment of the dry-air process, and they shipped 24 quarters of meat as an experiment, which, unfortunately, arrived here in a bad state, and they were seized in the meat market as being unfit for human food.

5853. That is not the same dry-air process that Mr. Bell, of Glasgow, adopts, is it?—I really cannot tell what process Mr. Bell adopts. Those gentlemen, not being deterred from trying it again, send another shipment of 24 quarters under the same process, and those 24 quarters were thrown overboard, because they got so bad during the passage that they could not bear the stench on board the ship. As regards the various processes, from the experience which I have had (and I think I have a letter in my possession now from some high authority on the other side, in the United States) that the process in which the meat is shipped from New York or from America is principally a speculation as regards the sale of certain patents.

5854. The Committee have not to go into the question of patents; but we have had before us a statement by Mr. Hamilton, who represents Mr. Bell, that, since 1875, he had been importing meat from America, not by the process of ice being driven through the pipes, but by the other process, which always arrived perfectly sound; and we have had Mr. Gillett stating to us that under the other process he has forwarded the meat in the condition which he described, both to Liverpool and to Bristol. I understand you to say that you have made experiments to Southampton and to Liverpool, and, as far as you have told us, the experience as regards the consignment that came to Southampton was not a very satisfactory one?—This came direct to London.

5855. What has been your experience with regard to the arrivals of the other cargoes which were consigned to you at Southampton and Liverpool?—They were about similar.

5856. It does not arrive in a satisfactory condition?—I believe not. It is a great pity that it should not, because it would be a great boon to this country if it came in good condition.

5857. Will you state the number of consignments which you have had, showing the Committee what your experience is?—I can give you the dates, and I can give you the totals. From the 22nd of August to the 16th of November last year, I had 4,266 quarters of beef, weighing 92,766 stone; of which 3,680 stone were condemned as unfit for food. The prices which it realised vary; the highest price was 5¼ *d.* per pound, the lowest price has been 2¼ *d.* per pound, and I believe the average price has been something like 4¾ *d.* per pound.

5858. Therefore you represent that if the statement is correct that 6½ *d.* is the remunerative price, those cargoes have not been a remunerative speculation?—Certainly not. I have with me a letter, which I have not the slightest objection to show you, conditionally of course; I do not wish the name published. I will show you the letter, and I think it will give you some light upon the matter.

5859. I think if it is not to be published I had better not see it?—It is only the name that I do not wish to be published; it is a private business, and it is a gentleman of high standing in the United States, and I think that it may throw some light upon the subject.

5860. I am afraid we cannot accept anything that is subject to not being published; have you continued your consignments?—No; I have ceased to receive any more.

5861. In consequence of the experiment not having been satisfactory?—In consequence of the consignments not having arrived in a satisfactory condition. At the same time the same parties, I believe, are still trying the experiment in the hopes of improving their condition.

5862. They may be some of those experimentalists who have, according to other witnesses in the trade, furnished these terrible samples of bad meat in London?—No, because I have had one consignment of 310 quarters of beef; one consignment of 323 quarters, and another of 385 quarters of Mr. Gillett, the gentleman who has given his evidence here; that was some of his meat.

5863. Was that some of the meat which he said he forwarded to London, finding it did not come over in quite satisfactory condition?—I beg your pardon. He came to me and asked me if I would undertake his agency for him at the time, knowing all the butchers connected with the market.

5864. I only mention that because Mr. Gillett said that, finding that some of the meat had not arrived in such a satisfactory state as they liked in Liverpool, so that they could not sell it there, they sent it to London?—I beg to differ from him there, because Mr. Gillett sent the whole cargo to London.

5865. Was that *viâ* Liverpool?—That was *viâ* Liverpool, but none of the cargo was sold at Liverpool during the time that I had to do with it.

5866. You also stated that you had had experience on this matter from having yourself visited the ships in which the meat came over; do you attribute the bad state in which this meat arrived to the condition in which it came over, or to its journey after being taken out of the refrigerator, and sent by rail to you?—I attribute it to various causes. From the information I have received, and from what I have noticed, it has been, I believe, because of not properly preparing the meat before it was shipped. I have also received meat of which neither the shipper nor the captain, nor the party in charge of the machinery could give any account as to the cause of its coming in bad condition, as the meat was shipped in good condition.

5867. May we infer from that that your evidence supports the evidence of the other gentlemen who have spoken as to the American trade, that the people out there are making experiments in order to ascertain the cheapest and easiest way of sending the meat over in proper condition to this country, and that when it comes in bad condition it is because one of those experiments has been tried which is not a success?—No, I believe they are working now under the same process as they did then.

5868. You are not able to speak personally with regard to what is taking place?—They work now under the same process as they did before, but whether there is any probability, by preparing the

Mr. *Pool.*

20 June 1877.

Chairman—continued.

the meat in the ice-houses over there before it was shipped, of making it keep longer, I am not in a position to say. I should consider, however, that, from the length of time during which the importation of meat has taken place from America, if there was any likelihood of any improvement being made in the mode of shipment or of transit, they would, by June 1877, have had ample time from 1875, to find that process out.

5869. I suppose you would admit that probably they have improved their process to some extent, because it is stated, and I imagine that it must be true, that a very large amount of the meat comes over in good condition?--The same as it has done before. A large amount has come over in good condition, and a large amount has come over in bad condition in the same ship.

5870. And you do not believe that the trade has been a remunerative trade to the shipper?—Not according to the accounts which I have of the parties connected with it.

5871. Do you believe that a trade which has sent over in 1876 nearly 18,000,000 lbs. of this dead meat, and which has sent it over continuously during that time, through hot weather and all, and which has, since the beginning of this year, sent over in four months, nearly the same amount, viz., 18,000,000 lbs., can be a losing trade, it having gone on for nearly a year and a-half?—I do not believe that it is a remunerative trade. I believe that it is worked upon speculation as regards the patents; and as regards the increase of the amount of meat, it might have been on account of the publicity which has been given to it in this country, and the great outcry which has taken place. It is like a new piece coming out at a theatre. When there is a large announcement, or a great outcry about it in the newspapers, everybody goes to see it, but the question is whether it will continue.

5872. But the fact is that a play at a theatre does not continue if it is a failure?—We do not know that this will continue. I hope that it may continue.

5873. What I pointed out to you was that the trade has steadily risen from the time when it began up to the end of 1876; that in that year the totals sent over have been progressive, rising from a commencement of 162,000 lbs. to 3,036,000 lbs. in the last month, with a total for the whole year of nearly 18,000,000 lbs.; and that instead of falling off after a year's experience, as it ought to have done if it had been a losing trade, the first four months of this year have shown a steadily progressive increase, rising up in last month to 6,000,000 lbs. and odd, the total in the four months being as much as in the whole of last year. Therefore it has been for the last 16 months a steadily progressive trade; do you represent that during the whole of that time it has been a losing trade?—It has been in the hands of more parties; various parties are embarking in the speculation under various patents, and consequently you must have a larger supply.

5874. Can you, as a tradesman, state from your experience of trade, that you have ever known a trade steadily progress under steady loss?—No; certainly not. No one has.

5875. You represent to us that the trade is not a remunerative trade?—I do not think so according to the statements.

5876. And yet the figures, about which there can be no dispute, show that the trade has progressed in a way which is perfectly marvellous?—So it has; and I will tell you the reason why it has, according to my opinion; because it has developed itself into the hands of people who have been trying to make the experiment.

5877. You do not believe in the idea that where a trade develops itself into more hands, the profits naturally fall off, and, therefore, the losses to all those people must be even greater than in the original case?—It naturally would be so; but we cannot tell, of course.

5878. And you think that they are all willing to become bankrupt for the sake of giving us dead meat?—I do not say that. They keep sending their meat in hopes of finding a better market. No doubt they have had times when it has paid them; but taking it altogether, they keep sending it, the same as any other merchant sends his goods, in the hope of finding a better market.

5879. My only reason for pressing you was, that you stated that you believe that this trade would not be a remunerative one?—I beg your pardon, I think you must have misunderstood me; I said that the transaction which I was alluding to was not a remunerative one, because the price quoted was 6 *d.* per pound. I cannot say whether it will be a remunerative trade, or whether it will not; but these prices will show that it cannot be a remunerative one, if not less than 6 *d.* per pound, will pay the importer?

5880. If it is true that it is increasing, the probability is that you will admit that it is finding its level and becoming a remunerative trade?—I cannot say whether it will do so or not; but of course time will show that.

5881. But the probability is, from the fact of its steady increase, that it has got over the difficulties which originally existed, and that they are now sending it at a profit?—They might do so; I cannot say from experience now, because none comes to me, but I believe, from what I hear out of doors, that they do not make as much as 6 *d.* per pound.

5882. If it is shown that it is a remunerative trade, we may find that it fills up the gap caused by the loss of the foreign import, may we not?—I hope it will do so.

5833. And that, therefore, the import of foreign cattle is not so necessary to the consumer of this country as it was before we had this other supply?—Certainly, because I do not say that we can continue to depend upon this supply.

5884. Supposing that the American dead-meat trade was established, and that the meat could be brought over here in proper condition, would you represent to the Committee that, notwithstanding that, it would not supply the wants of the retail butchers, who now depend upon the foreign stock?—If they could send it at a remunerative price it might.

5885. If the American dead-meat trade is a successful trade, and they place the meat in a proper condition on the market, would that supply the want of the retail butchers, which has been described to us as creating one of the necessities for the foreign import?—I do not think that it would

Chairman—continued.

would supply the want of the retail butchers if 10,000 tons a day came.

5886. Would you tell me why that is your opinion?—Because I heard the butchers say it. There are a great many butchers whose trade it will not suit.

5887. Is that because their trade is carried on in unventilated shops, and without proper appliances for keeping the meat, and that therefore they require to kill the animal on the morning of sale?—They have been accustomed, I believe, from time immemorial, to kill the animals as their trade requires.

5888. In this country, what has been the custom from time immemorial is always very difficult to get over. I understand you to say that you think that if they had a dead-meat market for their daily supply from which they could take meat in as good condition as the fresh killed meat in their own slaughter-houses, they would not adopt that trade?—I should not think so, and I will tell you why. They have had from time immemorial also an opportunity to go to the Metropolitan Dead Meat Market and buy the meat. If it would answer their purpose to buy the meat in general they would always have done so. This dead-meat trade has been in existence as long as we have been in existence, and longer.

5889. The dead-meat trade has developed itself very much since the Smithfield Market has been created, I think?—I do not think it has. It has only been two or three markets thrown into one; Leadenhall Market and a portion of the other markets have been thrown into the same market.

5890. Could you tell the Committee who now keep up the Smithfield Market, which is a very extensive dead market?—Almost every butcher, I believe, goes there, but they do not purchase all their requirements there.

5891. Therefore the retail butcher in London does at the present moment depend very largely upon the dead-meat supply?—They do not depend upon the dead-meat supply any more than they have done in former years. They have always depended upon the dead-meat supply to a certain extent for making up their requirements. Some butchers may go to the meat market and may require principal joints, and other butchers may require other joints; consequently the meat market has been established upon the same principle, and the butchers have gone to the Metropolitan Market and purchased their stock there, and killed them when they required them; and they also went to the old meat market and purchased what they required there. But if it would answer the retail butchers' purpose to make all their purchases in the meat market, I do not understand they should not have done so 30 or 40 years ago, because they had the same opportunity to do so then as they have now.

5892. You do not believe that the dead-meat market has very much increased since the establishment of Smithfield?—I cannot tell whether it has, or not; but the population and the requirements are very much larger than they were then, and no doubt it has increased.

5893. Still you admit the fact, that a retail butcher does depend for some portion of his supply upon the dead-meat trade?—For some portion he may, no doubt.

Chairman—continued.

5894. Therefore, although he may have a fancy that he likes to keep live animals ready to slaughter, supposing that he was not able to get those animals, he would still have the means of supplying his customers with dead meat?—If a supply came to the market he would, but if it did not he could not.

5895. Whilst he might lose the animal from abroad, even if he still adhered to his old custom, he would be able to buy the animal from the Islington Market?—So he would at a different price, no doubt.

5896. Is there anything else that you would like to put before the Committee in your examination-in-chief?—I should very much like to say a word or two with reference to an observation which I have heard made here by gentlemen with respect to the markets; that the Islington Market should be only for the London purchasers.

5897. You are referring, I presume, to Mr. Gebhardt's suggestion, that the Islington Market should be a market simply for the slaughter of fat animals?—Yes.

5898. What is your opinion upon that point?—I heard a witness state that the Metropolitan Market is the hotbed of disease, because cattle are brought from all parts of the country and mixed together there. I think that there cannot be more hotbeds in London than there are in the country, because the majority of the cattle are brought from the various fairs and markets in the country, and therefore they would have the same chance of contracting disease there as they would have in London, provided there was any contagious disease in existence.

5899. The object of Mr. Gebhardt's suggestion, as I understood, was that he was then talking of what he called the hotbeds of disease, which were the dairy-sheds of London, and the opportunity which was afforded of spreading disease in the country, because wherever disease broke out in one of those sheds as he stated, the chance was that the animals in contact were sent into the Islington Market, were bought by jobbers there, and carried from there with the possibility of an additional profit of 1 *s.* or 2 *s.*, into the markets around London, and thus were distributed and became centres of disease; and his suggestion was that, whilst not stopping the trade for slaughter throughout the country, he would absolutely prevent Islington being anything but a fat cattle market?—But you would have the same chance of disease by cattle coming from the country as by cows from the dairy-sheds in London.

5900. All that you would do, according to Mr. Gebhardt's suggestion, seems to me that you would prevent their becoming stock, and their being distributed as such throughout the country; but when they came there they might be taken anywhere, so long as it was for slaughter alone?—I believe that Mr. Gebhardt was alluding to cattle only being killed in London.

5901. I think you mistake Mr. Gebhardt's evidence; his evidence was that he would restrict the Islington Market to a slaughter market; that is to say, that an animal, when once there, should only leave the market for the purpose of slaughter?—Certainly; I agree with that.

5902. And that an animal should not be taken by a jobber from the Islington Market to another

Mr. *Pool.*

20 June 1877.

Chairman—continued.

market at Romford, or wherever it might be, and there sold in the open market, being there placed in contact with animals, fat as well as store, and thus distributing the disease throughout the country?—Certainly; that is my opinion as well.

5903. And you think that that would be an improvement upon the present state of things?—It would certainly be an improvement, because it has always been my opinion, and I have expressed it to the authorities of the market, that it should not be a store market connected with the fat market.

5904. And that they should not be allowed to go from there to any other market, where they would be placed in contact with store animals?—Certainly.

5905. But if they were bought for the purpose of slaughter, they might be taken to any town where the supply was wanted?—Yes; I have had some experience of the London cowsheds, and I think that the ideas are rather over-estimated in reference te their being hotbeds of disease.

5906. I suppose that a large portion of the supply of cows to the London dairies is brought from Holland?—Certainly a large supply, but a great many go into the country.

5907. You are aware that the Netherlands have, perhaps more than any other country, been subject to pleuro-pneumonia?—I do not know that they have been subject to it more than any other country; I cannot say that I can agree to that, because I have seen a great deal of it in England.

5908. We have figures before us, put in by the Consul General for the Netherlands, which show that pleuro-pneumonia exists to a very large extent among the stock in that country?—I am not acquainted with the statistics.

5909. If that is so, there is considerable danger of pleuro-pneumonia being introduced into the dairy-sheds of London from that source alone, is there not?—They are not imported as fat cattle, and they are not sold in the market amongst the fat stock.

5910. But they come into the London dairy-sheds?—Yes; but a large quantity of the Dutch cattle go into the country as well.

5911. I am asking you about what you wished to mention to the Committee, and that is, with regard to your idea that the dairy-sheds in London are not a source of disease?—I do not think they are.

5912. On that, I ask you whether you are not aware that the dairy-sheds of London are largely supplied by cows coming from the Netherlands?—Yes; I say they are, but the country is supplied at the same time.

5913. That being so, I then ask you whether you are aware that pleuro-pneumonia is a disease that has not been stamped out in the Netherlands, and that consequently the dairy-sheds are liable to have pleuro-pneumonia brought into them by these Dutch cows?—I do not think that they would stand any more risk of having it brought in by having the cows from the Netherlands than from any part of the United Kingdom.

5914. If there is that risk from cows from the United Kingdom or from Holland, what restrictions are there to protect the people from

Chairman—continued.

the spread of that disease by the animals being sent into the Islington Market as soon as it is found out that they are not well?—I should legislate for that if there is any fear of contagion. I do not believe that pleuro-pneumonia is contagious; but if you should think that it is contagious, I certainly should legislate for it, and not have them brought to any market.

5915. Do you think that it would be wise that no animal should be allowed to leave one of those dairy-sheds unless it was inspected?—That might be done to a certain extent; that might be a great assistance.

5916. And that thus you might prevent what has been suggested as the danger, which is, that when an animal was found to be ill in a dairy-shed, the animals in immediate contact with it were at once sent into the market and got rid of?—Probably that you might; but I do not think that pleuro-pneumonia is contagious for all that.

5917. Are you a veterinary surgeon?—I am not, but I have had a great deal of experience with the lung complaint, and also with the foot-and-mouth disease. I have had a great many cattle in my hands, and I have sold nearly 100 fat cattle from my farm since last November.

5918. Have you had experience of pleuro-pneumonia on your farm?—I am very pleased to say that I have not during the last two or three years.

5919. Have you had it sufficiently to enable you to speak from experience as to the contagion or the want of contagion in the disease?—I have had sufficient experience to enable me to say with certainty that I do not think it is contagious. I had, some years ago, a place in London where I used to have a man placed to sell milk, and I have sometimes, like other people, been so unfortunate as to have cows taken with the lung complaint, but I have never considered that it is a contagious disease. They have generally been slaughtered if they have been in a condition to be fit for human food.

5920. You mean to say that you had pleuro-pneumonia in your sheds, and that some of your animals were condemned for pleuro-pneumonia and slaughtered?—No, they were not condemned.

5921. There was no inspection?—No, there was no inspection.

5922. Did you send any of your animals, then, into the market?—I generally used to send them to the butchers to be slaughtered, and sell them if they were fit for human food; it would depend upon the condition of the animal whether it was fit for human food or not.

5923. Having had what you believed to be pleuro-pneumonia in your herd, did you find that it did not spread to other animals?—Certainly.

5924. From that you would argue that pleuro-pneumonia is not a contagious disease?—I believe it is not.

5925. Notwithstanding the experience of all the veterinary surgeons in the world to the contrary?—I have never heard the opinion expressed by the Veterinary Department, or by any veterinary surgeon that it was contagious.

5926. Are you aware that we have had it in evidence before this Committee, that it is absolutely infectious?—It is infectious, but not contagious

Chairman—continued.

contagious. I am speaking about its being contagious.

5927. I am not quite aware what you mean by contagion then?—The contagion that I am alluding to is this: supposing that you have a herd of cattle where the rinderpest may take place, of course you might naturally suppose that you would lose the whole lot; but if have 50 or 100 cattle on your farm, and one or two fall ill with the foot-and-mouth disease or with the lung complaint, there is no reason why any more should fall ill with the same complaint.

5928. You mean to say from your practical knowledge, and from your veterinary knowledge, that if you had pleuro-pneumonia in your herd, you would allow the other animals to remain with the animals that were affected with the disease?—I would not.

5929. You have some dread of pleuro-pneumonia, then?—It may be some time before it is discovered; it is not generally discovered in the first stage; it may be discovered in the first stage or it may not; it all depends upon circumstances, and upon the condition in which the animal is.

Mr. *M'Lagan.*

5930. I think you stated that you were a practical farmer?—Only upon a small scale.

5931. And you are a cattle salesman to whom cattle have been consigned, both from this country and abroad?—Yes.

5932. And you are also a commission agent to whom dead meat is consigned?—Yes; that is not my general business, but I have undertaken that on account of doing business with the gentlemen in the live trade.

5933. As regards your business as a practical farmer, what is the extent of your farm?—It is only 150 acres.

5934. Do you keep many cattle upon it?—I do sometimes; sometimes I have a great many.

5935. Is it principally in grass?—There are 20 acres of arable land, and the rest is all grass.

5936. Therefore you depend very much upon the grazing?—We do not in general, because we generally make the hay first.

5937. Therefore you have very few cattle upon your farm?—I think I have in proportion to the acreage; I think I have at times a good many; sometimes I have 100 or 150 of various sorts by me.

5938. Are they fed by the hay from your farm?—They are fed upon the hay from my farm, and mangolds, and distillers' grains; we purchase food.

5939. And you keep those cattle, perhaps, only two or three months on your farm, I suppose?—No; I have some which I have had by me upon my farm, for the last two or three years.

5940. How do you keep them in the summer?—After we have made the hay we turn them out. They do not go out to grass, except that I have few pedigree animals, and those we generally have a field for and do the best we possibly can with, until such time as the grass fails.

5941. But your cattle are principally kept in court-yards, I understand?—In sheds.

Mr. *M'Lagan*—continued.

5942. And therefore, as they are not going about, they are not so liable to infectious or contagious diseases, as if they went into the fields?—They go into the fields from about the end of July until about the end of the year, or as long as the weather permits.

5943. And you have only had pleuro-pneumonia once upon your farm?—I cannot say that I have had it once. I said that I experienced it. It was in reference to my London sheds. I might have had it in my farm too, for aught I know. We know that the animal goes back so quickly when it is affected with that disease that if it is fit for human food we generally dispose of it.

5944. Then you are in this advantageous position, that when you see an animal the least ailing, you take the precaution of sending it at once to the market?—That is so.

5945. Whether it be pleuro-pneumonia, rinderpest, or any other disease, you get quit of it at once?—That all depends upon circumstances.

5946. I thought you said so?—I have some valuable stock at my farm now, some pedigree stock, and if I thought there was anything amiss with them I should certainly not send them away without trying first to see what was the matter with them, whereas if it was an ordinary fat animal, which was fit for the market, I should certainly send it away directly if it was unwell.

5947. You take care that the disease shall not be so far developed but that you could tell whether it was pleuro-pneumonia or rinderpest. In fact, from being a cattle salesman, you have an advantage in disposing of those cattle which an ordinary farmer has not?—I do not dispose of any diseased animals.

5948. I should not call it diseased if the disease was not developed?—I do not sell any animal which is known to be affected with any disease, or which is supposed to be diseased.

5949. But if the disease is not developed?—Then I should be placed in the same position as a farmer, because a farmer may send his cattle to market in that event.

5950. Have you not, as a farmer, considered what would be the effect upon your cattle of having diseased cattle, either home cattle or foreign cattle, travelling along the roads near your farm?—I should not have any fear of cattle passing my farm or travelling on the high roads if they are affected either with lung disease or foot-and-mouth disease.

5951. Have you never heard from your communications with farmers that very often cattle that are feeding in fields are infected, particularly with foot-and-mouth disease, by cattle passing along the road?—There have been such cases reported, but it is my firm belief that foot-and-mouth disease is atmospheric.

5952. You do not believe in the contagious nature of it?—I do not.

5953. You have generally a very large number of cattle consigned to you from abroad, from Schleswig-Holstein, from Denmark, and from Germany?—From various parts.

5954. What number of cattle do you have?—Sometimes I have as many as 400 or 500 a week.

5955. And, therefore, we may argue from that that your trade in that particular branch would be

Mr. *Pool.*

20 June 1877.

Mr. *Pool.*

20 June 1877.

Mr. *M'Lagan*—continued.

be considerably affected if the import of those cattle were prohibited?—It would affect me as much as it would anyone else.

5956. It would affect you as an individual?—It would affect me as an individual in so far as that, if the importation were not to come, I should have just to keep to my farm or I should have to go into the meat market.

5957. But you would rather that the cattle did come, and that you should have your commission upon them?—I certainly would not allow the cattle to come if there was any contagious disease.

5958. But you would rather that sound cattle should come to you, and that you should get your commission upon them?—It is natural that I should, as anyone would in his business. I have the same interest in my business as a farmer has in his.

5959. I should have the same feeling myself if I were in your position; I should not like them to be prohibited either. But in that case you would think that any legislation, whether good or bad for the country, would not be so good for you if it prohibited those cattle from coming?—Speaking as an individual, it would not; but I do not believe that legislation is made for individual parties; I believe that it is made for the good of the general public.

5960. As regards the dead meat, I think you said that all the experience that you have had was from August to November?—From August to November.

5961. You had no consignments before that?—No, nor yet since; but I have seen the meat.

5962. So far as I understand your evidence, all the consignments which you have had amounted to 92,000 stone, of which only about 3,680 stone, or less than 4 per cent., was condemned?—I think it is plenty too.

5963. Do you not think that that was a very small proportion to have condemned?—I do not think you would think so if you had to send it to London, and I do not think so.

5964. Taking almost any business in the importation of a perishable article like beef, do you not think that 4 or 5 per cent. is a small proportion to go wrong on such a long voyage as that from America to this country?—If the profits were large in accordance, it might not be a large per-centage, but there is a great deterioration in the meat itself from the time it is shipped until the time of its arrival. Besides that, the figures which I have given you only represent the weight which I have received. I do not know the weight which has been shipped, only I have heard that the deterioration during the transit is at times very great; in fact Mr. Gillett has said so himself.

5965. Is there not also a deterioration both in the weight and also in the quality of live cattle coming over?—Not so much, I think, as in the dead meat.

5966. Is there not considerable deterioration?—Not so much.

5967. Is it not so great from many cattle dying and being good for nothing whatever?—That all depends upon the season of the year in which they are brought over.

5968. The loss in the dead meat imported depends, upon the season of the year too?—Probably it may be so, but a portion of this meat has come in October and November.

Mr. *M'Lagan*—continued.

5969. Part of it came in August, and perhaps the worst keeping months of the year are August and September?—Yes; June, July, August, and September.

5970. Therefore your experience of the importation of dead meat includes two months of the worst keeping season of the year?—There are four months; there are June and July as well; I believe those are considered two of the worst months.

5971. You say that you do not think that this trade of the importation of dead meat will go on increasing?—I cannot say that it will, and I cannot say that it will not; it all depends upon prices. If prices go up in the United States, and if freights advance, naturally, unless prices went up in England, the people could not send it, assuming the statement to be correct that 6 *d.* per lb. will remunerate them, and they have not made 6 *d.* per lb. yet.

5972. Have you heard the evidence which has been given in this Committee-room, that there are sufficient cattle in America to allow this trade to go on increasing without much raising the price in America?—I have heard it, but I am also in a position to state that since last year the price of cattle has risen considerably in America.

5973. You are aware that for some years there has been in America a very large increase of grazing cattle in Colorado and the other grazing districts?—I have heard it stated.

5974. And that to such an extent was the number of cattle increased, that, the price of beef was very much lowered, and though when the importation of dead meat to this country commenced, it raised the price of meat in America, yet that there are a very large number of cattle still ready to be imported into England without a still further rise in America?—It may be so, but I could not say.

5975. Supposing, then, that the price of beef does rise in America, what would be the effect in America; would it not be that the farmers would go on increasing the number of their cattle?—Certainly.

5976. Therefore, if the price rises there, the number of cattle will be increased?—Certainly.

5977. And, therefore, we need not fear any diminution in the number of cattle coming over to this country, even if the price in America should rise?—If the price increases in America it will only depend upon the English markets. If there was not an increase in the price in the English market, they could not expect an increase in the price in America.

5978. But supposing that there is an increase of price in this country, and an increase of price in America, the effect of that would be to make the farmers in America increase the numbers of cattle, will it not?—Certainly.

5979. And, therefore, considering the great resources for breeding cattle in America, we need not look for any great increase in the price of beef in America?—It may not be so; I cannot say.

5980. Evidence has been given in this Committee-room of the impossibility of bringing dead meat from the Continent; are you of opinion that it is impossible to bring dead meat from the Continent

Mr. *M'Lagan*—continued.

Continent in the same way as it is brought from America?—I believe it is.

5981. Will you give your reason for that?—It is because I believe that the distance is not far enough from England, and that the prices of meat are considerably higher in Holland, Germany, and other parts of the Continent, in comparison to what they are in America. Although the Continent is so much nearer England, the freights from the Continent are, in proportion, higher than, or as high as, they are from the United States. Then in America they have a facility of getting everything for the preparation, which I do not think they possess on the Continent. I have known an instance of 90 carcase of oxen arriving here from America; 50 tons of ice were required to preserve them previously to shipment, and 50 tons were required during the transit, making 100 tons for 90 carcases of cattle; consequently the amount of ice necessary for shipping 4,000 or 5,000 head of cattle and 10,000 sheep would be so large that I should not think that it is possible to procure it in those parts of the Continent. Besides that there are the preparations; they have no accommodation for slaughter at the Continental ports, and it would tend, as I have already stated, to stop the breeding of cattle, because they would be the losers of the entire offal, for which they have no market over there. Speaking in particular for those parts of Germany which you have alluded to, from which the Touning cattle come, of course they have no sale, and they would lose the entire offal. They could not import it, or at least it has never been tried, and I should not think the importation of meat from those ports could take place, because Ireland, which sends a large importation of meat during the winter, does not send any in the summer to the London market, and therefore I compare one with the other.

5982. Do you suppose that because Ireland does not send dead meat in summer Germany could not send it?—No; I should say that they could not send it.

5983. You say that one of the great difficulties is the want of ice?—The want of ice, and the disposal of the offal, and the want of preparations.

5984. Are you aware that at the present time there are refrigerating apparatus which can produce any amount of cold you want without any ice whatever?—I am not aware of it. I have told you about the experiment that one firm in New York have made by sending two consignments of meat without ice, and both of those failed.

5985. But although they failed once it does not follow that they will always fail?—It is to be hoped not.

5986. Have you never heard that there are apparatus by which you can produce 5 or 10 tons of ice in 24 hours?—I am not acquainted with it.

5987. Therefore, if that were brought to any perfection, you would be able to dispense with the use of ice altogether in bringing the meat from the Continent?—If that were the case you might.

5988. The next point was as to the disposal of the offal; what do the poor people on the Continent live on at the present time; do they never live on offal?—They do; but they could not consume the quantity.

Mr. *M'Lagan*—continued.

5989. Have you never heard of how the offals are disposed of in South America and other places?—I have.

5990. Do you think that the same practices could not be adopted in places like Schleswig-Holstein?—I do not think so, because they have a larger population in America to consume the offal.

5991. From your practical experience, what is the value of the offal?—It varies at different times.

5992. What is the average price?—There is the hide, for instance, which is considered a portion of the offal; it varies from 15*s.* to 3*l.* For instance, a cow's hide would only fetch 15*s.*, whereas the hide of an ox imported from Spain, or particularly from Portugal, would make 3*l.*, being of a superior kind. Then there are the head, the feet, the tripe, the liver, the heart, the tongue, the tail, and the fat, which are worth more or less, according to circumstances.

5993. What would all those come to?—The whole amount for the head, the feet, the tripe, the liver, and the heart, would be 12*s.*; for the tongue and the tail 5*s.*; and the fat averaging from 10*s.* to 30*s.*

5994. Is there any difficulty whatever in disposing of the hide on the Continent; could they not put up tanneries there as well as in this country?—There are some. Probably there might not be any difficulty about the hide, but it all depends upon whether the same price could be obtained.

5995. They might perhaps turn it into leather, and send the leather over to this country?—I am not acquainted with that.

5996. The next thing is the tongue; we have a large importation of salted tongues to this country; could not they salt the tongues there?—I daresay everything could be done at a sacrifice; but that, in my opinion, would tend to stop the supply.

5997. The loss would come to a few shillings; at all events, the tongue and the other parts could be preserved and sent to this country, or to other large consuming countries, and therefore the loss from the offal would not be so great?—The loss from the offal according to that would be only 12*s.*

5998. And you might reduce it to 5*s.* perhaps, by pickling the tongues and other parts?—That is exclusive of the tongues. The articles which could not be preserved, I think, amount to 12*s.* on an average in London. It would be a loss to the poor people of London.

5999. I thought you were speaking of the loss to the importer?—There are thousands of people in London, as is well known, who live upon this offal. It would also be a loss to the importers to a certain extent, if they could not turn it into money.

6000. If the poor people in London did not get that they would get beef instead?—If it were within their reach; if the price would permit it.

6001. I understood you to say that these cattle would not be imported into this country on account of the dead meat coming in from America at a low price?—I do not remember having said so; I said that it was on account of the restric-

Mr. *Pool.*

20 June 1877.

Mr. *Pool.*

20 June 1877.

Mr. *M'Lagan*—continued.

tions, and their not meeting with free trade and an open market.

6002. Would you maintain that cattle should be allowed to be imported into this country from all countries?—Certainly from those which are free from disease.

6003. Would you maintain the restrictions which the Privy Council have at the present time?—No.

6004. Do you think that they are too severe?—No, I cannot say that they are too severe; they are too severe to a certain extent. For instance, I think that there should not be this prohibition in the case of a country like Schleswig-Holstein, where there is no disease known.

6005. But they are allowed to come in?—Only into Deptford Market. I would have them come into London, to a free trade and to a free market. According to my opinion, and according to a letter which was received this morning from Schleswig-Holstein, there is not the slightest doubt that if cattle have to be sent to the Deptford Market (which will not suit the importer, and particularly under the restrictions, because they have not the chance of a fair and open run of trade), they will send their cattle to France and other parts, and they are now under treaty for sending cattle over to France, because cattle at the present time are making as much in France as they do in London.

6006. It would depend upon the price of the meat; if they could get more profit in France they would send it there?—Certainly; but this country would lose the supply.

6007. If the price got higher they would still continue to send the cattle here, would they not?—I suppose that they would send it to the best market, there is no doubt about that.

6008. Then do you advocate the doing away with the Deptford Market altogether?—I certainly would, because I would not allow any cattle to be imported from any country that is affected, and because I do not think that Deptford Market is a preventive of the introduction of any infectious disease. If it is true, as we have heard, that sheep can carry the disease, and that a human being can carry the disease, if such disease is in existence, I should think that the Government would require to disinfect every human being that comes to Deptford Market, and every horse and cart, every officer, and every steamer, and every sailor who is in contact with the cattle.

6009. Then I understand your opinion to be this: that you approve of the restrictions of the Privy Council at the present time, with this exception, that you would do away with the Deptford Market?—I would, certainly. That is my recommendation, because I would not import cattle from a place where there was any suspicion of infection.

Mr. *Torr.*

6010. You alluded, I think, to a rise in the price of cattle in America since the export of meat took place?—Since last year.

6011. Do you know that as a fact?—I do.

6012. In what market in America was that?—I have had the information from a gentleman who is at the present moment shipping a cargo of cattle to England *viâ* New York from St. Louis.

Mr. *Torr*—continued.

6013. I asked you whether you knew it to be a fact of your own knowledge that cattle had advanced in price in the New York market?—From what a gentleman told me they have. He sent two consignments over in the month of May, he has gone back, and he tells me that since he was there last year the prices have certainly risen in America. That is the information which I have.

6014. Do you know that a very large proportion of the cattle which are sent to this country in the way of dead meat comes from Chicago?—I do not know that so much comes from Chicago as from New York.

1015. But it is at Chicago that the cattle are bought?—Yes; and cattle are brought from St. Louis, which is even farther than Chicago.

6016. Do you know that the cattle in Chicago have not advanced in price?—I can only give you the information which I have received.

Mr. *Dease.*

6017. Are you aware that it has been stated in evidence before this Committee that the wholesale price of meat in New York is about 4½ *d.* per lb.?—I have not heard anything in reference to the wholesale price.

6918. Have you ever heard what is the retail price of meat in New York?—I have not.

6019. Have you ever heard of the retail price amounting to 9 *d.* per lb.?—I may have heard it, but I cannot speak with certainty as to that.

6020. Supposing the wholesale price at New York to be 4 *d.* per lb. and the retail price to be 9 *d.* per lb., would it not appear that there would be a considerable profit to the exporter on sending meat over to Europe?—I should not say that there would be a considerable profit; because, if it cost 4½ *d.* per lb., and the expenses are 1½ *d.* per lb., that makes 6 *d.*; and consequently they must make more than 6 *d.* per lb. to make it pay. Whereas, if the cattle cost the same price as meat, cattle would naturally make more in this country; and this would, according to my opinion, forward the trade to a very great extent; because every ounce of meat when live cattle come could be consumed, whereas, of the meat imported, at times large quantities are unfit for human food.

6021. Still, though large quantities may have been affected in coming over, we know that a very much larger quantity has been sold in our markets, and has been found most excellent?—Probably it might. Some of it has arrived in good condition, and some has not.

6022. In the same way some of the live cattle have been thrown overboard, and there has been a loss incurred in that way, has there not?—Not in proportion. It is only at certain times of the year that you can ship live cattle. I think that after the month of August or September no one would bring any live cattle, because I believe the risk would be so great. At those times they might probably ship larger quantities of meat.

Mr. *Murphy.*

6023. I think you said that, if the supply of American meat continues uninterruptedly, the continental imports would probably cease?—I do not think I said so.

6024. If

Mr. *Murphy*—continued.

6024. If the supply of American meat was so unlimited as to bring the price below what would pay the continental importer, would not the desire on the part of the continental importer to send his beasts here be less?—It would, certainly.

6025. You think, of course, that the competition is necessary to keep prices down?—Competition and free trade.

6026. Are you aware how many foreign beasts are imported into England in the course of the year?—I cannot tell you how many foreign beasts are imported into England in the course of the year; I have heard it stated, but I have kept no record of it.

6027. Taking it for granted that the supply in America is practically unlimited, and also that the prices of meat in America rise, as they have risen according to your statement, would not the effect be merely this: that the profit to the American exporter would be less than it is now, but that still he would have such a profit as to induce him to continue his exportation?—Certainly, he would have less profit unless the market were to rise here.

6028. But still, the supply being unlimited, he would have, nevertheless, a sufficient profit to induce him to send his dead meat here?—No doubt, if he has a profit, he might continue to do so.

6029. With reference to your idea that the importations of dead meat is a loss, how do you account for the fact, that in the month of November 1875, there were but 36,000 lbs. of American dead meat imported into this country; and that in the month of March 1877, there were between 6,000,000 lbs. and 7,000,000 lbs. of dead meat imported?—I did not say that it was a loss. I said that, according to the statement which had been given here, 6 *d.* per pound was a remunerative price; and that as the 4,266 quarters of beef which I have had through my hands, averaged 4¾ *d.* per lb., therefore that would not be a profit. I could not say anything more about the American beef being a loss; I only speak of the consignments to myself.

6030. Do you mean to give that as an instance of what the general effect of the importation of dead meat from America is?—I mean to give it as an instance of what it has been so far, because I believe there has been no particular time when they have made 6 *d.* or more.

6031. Then are we to understand from you that the instance which you have given as to the quantity that came under your knowledge as producing 4¾ *d.* per pound was an exceptional case, or do you give it as an instance of the general effect of the importation of dead meat from America?—Of the general importation of dead meat.

6032. Do you give that 4¾ *d.* per pound which you got, and which came under your knowledge as an instance of the general effect of the American importation of dead meat?—Of course, I must give it so, because I believe that the meat generally comes in the same condition as this arrived in.

6033. Do you consider that a year and a half, from October 1875 to March 1877, is a fair time for the experiment, and is sufficient to give people who are engaged in the American dead meat trade, a fair knowledge of what the future probabilities of the trade are?—I should think so.

Mr. *Murphy*—continued.

6034. And therefore, the trade having increased, that knowledge and experience of a year and a half ought to be a fair ground for forming a guess, if I may call it so, as to whether the trade would probably continue?—That all depends upon circumstances. It depends upon whether the price of meat in America continues or whether the price of meat in England will go higher or lower. It depends upon the market. But in reference to my opinion as to whether any improvement has been made in the shipment of the meat, I must say that, from the period over which the experiments have extended, I should think they have gained sufficient experience to know whether any improvement could be made or not.

Mr. *King Harman*.

6035. You say you do not think that either rinderpest or pleuro-pneumonia is contagious?—I do not.

6036. But you think that they are atmospheric?—I think that foot-and-mouth disease is atmospheric; I did not say that rinderpest was.

6037. You think that rinderpest is contagious?—Certainly.

6038. Do you think that there is any other disease, except rinderpest, that is contagious amongst cattle?—I cannot say.

6039. You stated that you would recommend that the import of cattle should be free from all countries in which there was not contagious disease; do you mean to recommend that the import of cattle should be free from every country in which there was not distinctly known to be rinderpest?—Certainly, or any other contagious disease which may exist, if there is any, I cannot tell that.

6040. But you do not include pleuro-pneumonia?—Certainly not.

6041. Nor foot-and-mouth disease?—Certainly not.

6042. Nor sheep-pox?—I have not sufficient experience to talk about sheep.

6043. Would you say that glanders was contagious?—We have not got that amongst cattle; I have heard of it amongst horses, but I have not sufficient experience of it.

6044. Do you think that scab is contagious?—I have not sufficient experience of sheep to enable me to give an opinion.

6045. You say that you lost 4 per cent. on some dead-meat cargoes which you imported, and you look upon that as a very heavy loss?—I do not think that my statement is thoroughly understood; this is a dead loss of 3,680 stone, from which the owner or the public does not receive any benefit.

6046. I put it as a dead loss; I do not mean to go into the question of deterioration at all, I am talking of 4 per cent. dead loss, and you think that a large per-centage?—I should think so if I had to ship meat to England.

6047. Would you be surprised to hear that, by the Return of 1876, it appears that 7½ per cent. of the cattle alone (without speaking of sheep), were thrown overboard, or died either on board or on landing?—Probably that might be for a whole year, but this experiment is only for two months.

6048. It does not matter whether it is for a year or for a century, the percentage is the same;

Mr. *Pool.*

20 June 1877.

Mr. *King Harman*—continued.

you consider that four per cent. is a very large dead loss on dead meat; I say, should you be surprised to learn that 7½ per cent. was the dead loss from throwing overboard live cattle, and from deaths from exhaustion, and so on, in 1876?—Certainly; but although the percentage may be the same, there is a certain time of the year in which you cannot import live cattle. The quantity of meat of which I spoke, came in the months from the 22nd of August to the 16th of November; supposing that the same quantity, or larger quantities had arrived in the month of June or July, probably the percentage might have been larger then; but I can only go upon the facts which I have before me.

Chairman.

6049. On what you have before you, the fact is, that the loss has been 4 per cent., whereas on what is absolutely before the public, the loss on the live trade is 7½ per cent?—That may be so.

Mr. *King Harman.*

6050. Do you think that the fact of our excluding live foreign cattle from our markets would materially lower the price of meat in the large foreign towns, say in Paris?—It might, if a larger proportion was imported than their consumption required; but in reference to any restrictions upon importation, I think they would tend to stop farmers breeding cattle for the purpose of export.

6051. Do you believe that the fact of Great Britain excluding foreign cattle from its ports, would materially lower the price of meat in the large foreign meat consuming towns, and particularly in Paris?—I think it would.

6052. Materially?—I cannot say that it would materially; it all depends upon circumstances.

6053. You can speak as a practical man?—If the importations from various parts of the Continent found their way to other markets, and if the supply was more than their trade required, naturally prices would go down, but I could not say to what extent they might go down.

6054. If the prices in the large foreign meat consuming towns went down, would not that very much tend to drive the producer into seeking a dead-meat market in England?—No, I do not think that they could carry it out.

6055. That is a matter of opinion?—That is my opinion.

6056. But he would naturally be inclined to try back to his old market in the best way he could get to it if he lost his price in the new one?—He might do so until he found which was most beneficial to his interest.

6057. You stated that you had seen American meat arrive in the same ship, some of it in good condition, and some of it in bad condition, on what principle was that meat sent over?—On the usual system, by placing it within the refrigerator surrounded with ice.

6058. Could you give the name of the ship or of the shipper, and the dates?—Yes, I can give the particulars; I have them here from the salesman in the Metropolitan Meat Market. I have the price, the weight of every identical article, the name of the ship, and the date when it was sold. I have the accounts which I can show you; some of it I believe, was sold as low as 1 *s.* and also 8 *d.* a stone.

Chairman.

6059. Were you certain that it was part of the same cargo?—There was no other; it was all to the same consignee.

6060. Did the whole consignment come out of that one vessel?—There was no other shipper in that vessel; he was the only shipper in that vessel.

6061. Can you absolutely state, of your own personal knowledge, that this consignment came to you from one individual, in one cargo, which was treated in exactly the same way?—I have the sale-accounts of the whole cargo which was in the ship at the time. They will give you the full particulars, and there was no more meat in the same ship when she arrived.

6062. That would make it conclusive that it was the same meat?—That would make it conclusive that it was the same meat and the same ship, and there was no other meat in the ship but that meat.

6063. You are prepared to state that part of that consignment arrived in a condition to fetch a good price, and part to fetch a bad price?—Yes. (*The Witness handed in the Statement to the Chairman.*)

6064. This shows that there was a fluctuation in the trade; that is to say, that at one time there was a greater quantity on sale, and that therefore the price was reduced; but it does not show conclusively that it arose from the quality of the meat?—This arose particularly from the bad condition of the meat.

6065. What was the name of the ship?—I can give you the name of the ship; I believe it was the "Australia."

6066. Are you able to speak from your own personal knowledge as to whether the cargo, which came over in the "Australia," came over in one refrigerator or in a refrigerator which was divided into compartments?—In one refrigerator.

Mr. *Chamberlain.*

6067. Have you had any experience of the trade in sheep?—My experience in sheep is not much.

6068. I understood you to say that if the live cattle trade with the Continent of Europe were prohibited, you do not think that the dead-meat trade would be substituted for it?—I do not.

6069. Do you get that information from the shippers?—From the farmers in general, and from the shippers too.

6070. You think that they would prefer to send their live cattle to other countries?—They would certainly prefer to send them to the best market; but it is my firm belief that they would ultimately go back to their old system of farming which was in use previously to the importation.

Colonel *Kingscote.*

6071. Where is your farm situated?—In the county of Middlesex, in the parish of Edmonton, near Southgate.

Mr. *Arthur Peel.*

6072. You would abolish the Deptford Market?—I certainly would.

6073. Would you abolish the Deptford Market because you think that a dead-meat market is no security against foreign disease, or because you

Mr. *Arthur Peel*—continued.

you think that Deptford is not a free market?—I would abolish the Deptford Market, because I do not think it is a free market, and because I do not think that it is a safeguard against the importation of disease.

6074. Why is it not a free market?—Because we do not get the attendance of the butchers in general; we are dependent upon only a few purchasers. The largest number, I think, would not exceed 30, whereas in the other market we have as many hundreds.

6075. You think that the retail butchers in the Deptford Market are in the hands of a few large people?—There are no retail butchers in the Deptford Market. The importer is in the hands of a few large people.

6076 I understood you to say that the small butchers had no sheds in the Deptford Market?—They have no slaughter-houses there.

6077. Do you think that, in consequence of the artificial restriction of competition in the Deptford Market the prices to the consumer are enhanced?—No; the price to the importer is reduced.

6078. Then you are in favour, in short, of free import?—I am in favour of a free import.

6079. And you do not care whether it is dead or alive?—I do not care whether it is dead or alive; and I am in favour of free import certainly.

6080. You were asked if you were not afraid of a glut in the market; I suppose you are not at all afraid of a glut in the market?—I certainly should be afraid of a glut of dead meat in the market, because if, for instance, you have the same quantity imported dead as is now imported alive from all countries, during a certain time of the year, there would be such a glut in the market that it would be impossible for it to be disposed of, because it is not an article which could be kept, whereas the live animals can be kept until such time as the trade demands their slaughter.

6081. Of course, if the market was glutted, people would take care not to send the meat in such large quantities?—Yes, but you could not avoid it.

6082. The Chairman pressed you very closely and very fairly as to a statement which you made; he asked you whether it was possible that if the dead-meat trade had been unremunerative for so many years, it should still go on increasing in such large quantities?—I do not know that it has been going on increasing for so many years.

6083. You distinctly said so yourself; the Chairman asked you whether you knew of any other trade which was not remunerative, and which still went on in increasingly large proportions year after year?—I was under the impression that the Chairman was alluding to the American dead-meat trade.

6084. I am speaking of that; is it your opinion that a great number of people have embarked in that trade, and that the loss which exists has consequently been distributed over a greater number of people than before?—If there is any loss, naturally it would be so.

6085. Would that be any explanation of the fact of the trade continuing, notwithstanding the loss?—I go by what the American gentleman has stated, that 6 *d.* per pound would pay them; and whereas the 4,000 quarters of beef which I have had only realised about 4½ *d.* per pound; of course, naturally, it could not remunerate them.

Mr. *Arthur Peel*—continued.

6086. There are more people competing and more people speculating?—There are more people competing, and more people speculating, and more people getting into the practice of exporting meat. It is naturally done for the sake of gain, whether it is for the purpose of getting a profit upon the meat, or whether it is for the purpose of selling their patents.

6087. Are all the processes under which the meat is brought patents?—Yes; I believe there are various kinds.

6088. In short, they are competing for the prize, and they can stand an intermediate loss?—I have heard so.

6089. What, in your opinion, is the lowest price at which it would be remunerative to introduce dead meat from America?—I cannot tell; I have heard it stated here that it is 6 *d.* per pound.

6090. Is it, or is it not, your opinion that that is a remunerative price?—I cannot say.

6091. What price do you think would be remunerative?—I am not acquainted with it; I know the expense of the preparation.

6092. But you do not know of your own knowledge what is the lowest remunerative price at which American meat could be sold in this country?—No, I do not; I have heard it stated that it is 6 *d.* per pound.

6093. Can you state what is the average price of American meat?—I could not say from my own knowledge, but only from hearsay; I understand that it does not make 6 *d.* per pound.

6094. If the freight rose from 30 *s.* a ton to 50 *s.* a ton, I suppose that would have a very large effect upon the price of the meat?—I do not say that; I do not suppose that a rise of 1 *l.* per ton in the freight would have that effect, although the rise in the freight and the rise in the price on the Continent combined might do so. Of course an increase of 1 *l.* a ton in the freight could not make such a material difference. You must take everything into consideration. I said that, taking the freight into consideration, if the freight rose from 30 *s.* to 50 *s.*, as it was in 1873, and if the price of meat, both in this country and America rose, then, in my opinion, they could not go on sending dead meat from America.

6095. If the freight rose from 30 *s.* a ton to 50 *s.* a ton, in your opinion might not that dislocate all the conditions under which the meat trade is now a success?—I do not think that a rise in the freight of 20 *s.* per ton would affect it so much.

Mr. *Chaplin.*

6096. In reference to the consignments of meat from America of which you speak, you told us that some of the meat was bad from imperfect preparation, and that some of it was bad without any cause?—As to some of it they could not give an explanation.

6097. When was the meat that was bad without any apparent cause first found to be bad; was it immediately on the arrival of the ship?—Certainly, because the refrigerator is not opened till then.

6098. I assume that sometimes it must be opened, because we have heard of meat being thrown

Mr. *Pool.*

20 June 1877.

Mr. *Pool.*

20 June 1877.

Mr. *Chaplin*—continued.

thrown overboard during the journey?—Then the entire lot is spoilt; but the refrigerator is is not opened until the meat is taken out.

6099. You told us that some meat in some of your consignments was found to be bad, and that no cause could be assigned for it; was the whole of that cargo bad?—No; only a portion of it. There have been no whole cargoes bad to my knowledge, except those 24 quarters which were tried on a new experiment, and which were thrown overboard.

6100. I understand that your great objection to the dead-meat trade is the difficulty in the distribution of the meat to the consumers throughout the country?—I am not against the dead-meat trade.

6101. I understood you to say just now, in answer to a question which was put to you by the Member for Birmingham, that your great objection to the trade in meat (but confined entirely to dead meat) would be the difficulty in

Mr. *Chaplin*—continued.

distributing it?—Certainly; as regards the whole importation, it would.

6102. That is to say, the great difficulty of distribution to the consumers throughout the country?—There would be so much at one time that it would be impossible to consume it.

6103. If the American dead-meat trade became an established fact in this country, do you not think that it would be possible to regulate the supply so as to meet the demand without there being any great glut?—I do not think so.

6104. You think that it would be impossible?—I do not know about its being impossible. My only reason for not thinking so is this: Mr. Bell was the first shipper: Mr. Eastman followed; and after Mr. Eastman some other gentlemen came into the trade, and we cannot tell them how many would come into the trade if it should prove remunerative; and therefore it is an impossibility for anyone to say that the trade can regulate itself.

Mr. Josiah Burkett, called in; and Examined.

Mr. *Burkett.*

Chairman.

6105. I believe that you are connected with the Central Meat Market?—I am.

6106. Are you a salesman both of American and English dead meat?—I am.

6107. As such, you can speak as to the condition of the American meat on its arrival in London?—As a rule.

6108. Are the consignments to you of American meat very large?—At times they are.

6109. From your experience of those consignments, what have you to tell the Committee in regard to the condition in which the meat arrives here?—The best that I have seen has come by Mr. Link, as a rule.

6110. That was a witness from Liverpool, who has been examined before this Committee?—Yes.

6111. Those consignments have come to the London market in good order?—Yes; and they have fetched a high price; something considerably over the others; I should think, perhaps, 1½ *d.* per lb. more.

6112. Do those cargoes run level in condition, or do you find that, as the last witness stated, some of the cargo comes in in bad condition, and the rest of the same cargo comes in in good condition?—I will take one man's meat first. From January until the first week in May the whole of Mr. Link's consignments were in good condition, and since that time we have had about four shipments arriving in not so good a condition; I heard that the reason was that the hot weather set in in America about 14 days sooner than it was anticipated.

6113. They were not prepared for the change in the weather?—They were not prepared for the change in the weather, and there was not so much care taken as usual.

6114. And you think that the bad state in which those later cargoes arrived was accidental? Yes, and it will be altered shortly.

6115. Has that inferior condition continued up to this present moment?—Yes; we have some in to-day, and that is no better.

6116. So that you cannot say that any improvement has been made?—Not yet; and there has been scarcely time, I should think.

Chairman—continued.

6117. You say that up to a given date the consignments all arrived in good order, and fetched a high price?—Yes.

6118. What was the average price during those months?—The average price was as nearly as possible 6¾ *d.* per pound for the whole time from the 1st of January to the first or second week in May.

6119. Therefore, if that was the average price realised, I suppose, if the statement which has been made to this Committee as to the remunerative price being 6 *d.* or 6½ *d.* per pound is correct, that would represent a remunerative trade?—A very large profit indeed, and that is the reason why we had such immense quantities in March, because they found that it paid so well.

6120. They found that it paid so well that you got a very large supply in that month?—Yes; that was the reason of the additional supply, so I was informed.

6121. The whole supply rose to nearly double at that time, I believe?—Previously to January the meat came in very bad condition, week after week, for about four months. I am taking now September, October, November, and December.

6122. Can you state what the average prices of the meat in that condition were in those four months?—I should say about 5¼ *d.* per pound.

6123. It was under the remunerative price?—The whole of it was done at a loss, I was informed.

6124. You are not speaking of any of those consignments which we have been told realised only 2½ *d.* per pound?—I have had a quantity of that meat, but I am now speaking of one particular sender or consigner.

6125. And that man's consignments, even when they were not so good in quality, never went below an average price of 5 *d.* per pound?—No; because his meat was then the best that came, even although it all came in bad condition.

6126. And

Chairman—continued.

6126. And all that came through Liverpool?—Yes.

6127. And it had stood the journey from Liverpool after it had been removed from the atmospheric conditions in which it had been brought over on board the ship?—Yes. Occasionally it is taken from the chamber on the Saturday, and it remains in Camden Town in the trucks the whole of Sunday; and that is 24 hours extra.

6128. So that it has been for 24 hours outside the chamber before you dealt with it?—Yes.

6129. And even with that amount of exposure to the atmosphere those consignments were in good order during the five months when it realised 6 *d.* per pound?—Yes, it would be about the same; there was very little difference at that time.

6130. When we come to deal with the other cargoes which did not arrive in such good order, I suppose that 24 hours had a material effect upon the condition of the meat?—Yes. I should like to make a few remarks with regard to that consignment. I think about the 14th of last August, I saw a shipment of meat in the best condition that I ever saw any come in. That was during the extremely hot weather, and we were anticipating that it would all come in an excessively bad state.

6131. Was that part of Mr. Link's?—Yes, it was Mr. Link's, and, to our great astonishment, it was the freshest we ever saw.

6132. That was the cargo, which Mr. Link told the Committee was the best that he had ever imported, and this importation took place when the thermometer was at 104 degrees in America, and when it was very hot in this country?—Yes, they had a very large quantity of that. I think, as far as I can say, that it made about 7¼ *d.* or 7½ *d.* per pound.

6133. To your knowledge, was there anything in that cargo which conduced to its coming over in better order than others?—Yes, they had been more careful, and had placed less in the chamber.

6134. It was not packed so closely?—It was not.

6135. At all events, in your opinion, that proves the fact that, with proper care, these consignments may be sent over, even in the hottest weather, in perfectly good condition?—We have decided proofs of it; we have had it so many times.

6136. You have had more than that one instance?—Yes; with the other cargoes we have found it so. Where they have sent, perhaps, 430 or 500 quarters, as a rule, it has come in better condition than where they have sent 2,000 quarters.

6137. It depends very much upon the closeness with which the cargo is packed?—Yes; and it appears that the smaller the chamber the better the condition of the meat.

6138. Therefore, to adopt the system which has been suggested of dividing the chamber into compartments would, in your opinion, conduce even more to the good condition of the meat?—Yes. If you are speaking just now about a cargo of meat containing two qualities as regards condition, I have seen it so several times myself when it comes in the same chamber. In meat which has been taken from one chamber I have frequently seen a difference in value of 1½ *d.* per pound.

6139. Is that sufficiently regular in its occurrence for you to have traced the reason?—We attribute it to the fact that the meat that comes in good condition is nearest the ice.

6140. You mean that the temperature of the chamber in which it comes over is not kept exactly even; that one part of the chamber is colder than the other; is that what you mean?—It is supposed that during the transit of the meat it gets neglected by the engineer, who ought to look after it.

6141. Would not that affect the whole chamber?—No; because the meat that hung nearest the four boxes of ice, as I have had it described to me, would come in the best condition; and the meat that was in the centre of the refrigerator would, perhaps, be in a bad state.

6142. And that, you think, accounts for the varying condition of the cargoes?—Yes; I have seen them vary to the extent of 1½ *d.* per pound, and that is almost 20 per cent.

6143. Is there any other point with regard to Mr. Link's consignments that you would desire to mention to the Committee?—Yes; I have another remark to make. Our best butchers, the leading butchers, purchase it when the condition is good enough.

6144. It has found ready sale amongst the leading butchers of London?—Yes; they buy it daily.

6145. Have they bought it steadily, or do they only buy when your cargoes come over in that good condition?—Within the last month, even to-day, they have purchased it; they have chosen the best to-day.

6146. For sale amongst customers?—Yes, for this day's immediate use.

6147. You corroborate, then, the evidence of a London butcher who stated that he believed that a very large amount of American meat was being sold to the consumers without their being aware of the fact?—That I cannot say; but I know they use it.

6148. Do the butchers generally, throughout the town, use it?—Yes.

6149. And when it comes over in that condition, it has a ready sale amongst the retail butchers in London;—Yes; it has a very ready sale at a good price, and the quality is superior to almost anything.

6150. Do you think that the quality of the American meat is superior to that of other meat that passes through your hands?—There are other meats that are held in preference. There is the Aberdeen beef; those that use Aberdeen beef use the American meat.

6151. The butchers who are in the habit of supplying their customers with Aberdeen meat are not afraid of supplying them with the American meat when it is in good order?—They do so without any hesitation.

6152. Are you prepared to give the Committee information with regard to any other consignments?—I have occasionally seen Mr. Gillett's meat come in good condition.

6153. Mr. Gillett consigns to you also?—Yes.

6154. Is that a steady consignment, or an occasional cargo?—About two shipments a week, and sometimes three.

Mr. *Burkett.*

20 June 1877.

Chairman—continued.

6155. To you?—No, not to me entirely; to be distributed over the market more or less. It comes to the London market.

6156. Does that of which you have had experience yourself come over in good condition?—Some of it I have seen in excellent condition. Last week he had some that came in excellent condition.

6157. Last week, during that hot weather?—Yes; it was suitable for any shop, or any trade in London.

6158. And in the hottest weather which we have had during the last few days, it had undergone the process of travelling?—Yes, about 14 hours or 16 hours' exposure.

6159. And still it was sold in the market in good order?—In good order.

6160. Have you tested at all, in either case, the time that it would keep?—It depends upon the period of the year.

6161. Take the cool weather first; how long would it keep then?—From January until April, which is about the coldest part of the year, it would keep from a fortnight to three weeks.

6162. You mean that, after landing and being taken out of the refrigerator, it would keep for that length of time?—Not if it is cut; it will keep in portions weighing 40 or 50 lbs.

6163. After you have dealt with it for sale in the trade, it would keep for a fortnight?—Sometimes it would keep a month in the cold, sharp easterly winds; in fact, I do not think that it would spoil in that time. It keeps longer than English meat.

6164. Having been so prepared in America as to drive out the animal heat first, it is able to resist the atmospheric influence afterwards?—It is. It chills the whole of the fat, and that preserves the lean.

6165. That is with regard to the months from January to April; have you considered its keeping properties when we come to hot weather, say at the present time?—I think it will keep two days after it is sold in our market.

6166. By that you mean two days plus the 14 hours occupied in travelling up to London?—Supposing that we receive a consignment to-day from Liverpool, sent yesterday, I should say that it ought to be sold to-morrow, at the latest, as a rule; but some of it would keep longer than that without being placed in a refrigerator.

6167. If the butchers' shops throughout the country were prepared as they are in America for the purpose of keeping meat, do you think that you might keep it even longer than that?—Most of the shops have refrigerators now; I know of numbers of shops that have large places, rooms, in fact, built up as refrigerators now.

6168. Having those refrigerators, do you still say that it would not keep more than two days?—It would keep a week with ease.

6169. If the butcher had such a chamber in which he could place it until his customers wanted it?—Yes; when the meat is purchased fresh from our market, and when it arrives fresh, it would keep fully a week without any trouble at all, and it might be sold fresh on the seventh day.

6170. And you are satisfied that it might be relied upon by the retail butcher for his trade, even in hot weather?—Yes.

6171. Have you any other consignments made to you from America besides those through Mr. Gillett, and through Mr. Link?—Yes; I have had some from Mr. Samuels, for whom Mr. Pool is the agent.

Chairman—continued.

6172. Have you found those to arrive in good order?—No; in a very bad state.

6173. Then you agree with what Mr. Pool stated, that it did not arrive in good condition?—It was in a very bad state.

6174. Do you attribute that to the process by which it had been prepared?—Yes; to negligence through the whole process, I should think.

6175. To negligence on the part of the consignors?—Yes; the fault would lie in the manner in which it was sent.

6176. And from the experience which you have had of the trade which is carried on through the other consignors, you believe that that need not have occurred?—I do.

6177. Can you speak as to the way in which this meat is distributed to the consumers; do the retail butchers buy for their weekly supplies from you?—Some of the butchers do not slaughter at all, and they come into the market and buy the whole of their meat daily, early in the morning; they make their purchases of certain parts that they require, and it is taken home and delivered to their customers. They come daily in weather like this, and buy just about as much as they think they will require.

6178. Do you now refer to Mr. Tallerman's store?—No, I am now speaking of the wholesale market.

6179. The butchers buy wholesale for their retail trade, under the conditions that you state, of the possibility of keeping the meat for a considerable time?—They do. We will suppose that to-day the market is over-stocked, and they see an opportunity of saving by making a purchase. If they have the necessary conveniences to hold that meat over until they want it, when they know very well that perhaps three or four days hence things will rise in value, they buy and hold it over; otherwise they would not venture to buy it.

6180. And you find that that is practised by the trade?—Yes.

6181. It has been represented to us that the retail traders are immensely dependent upon the purchase of live animals, because of the difficulty of the small man dealing with his trade in the hot weather, and the consequent necessity of his having the animals to kill in the morning; but do you find that the retail butchers avail themselves of this dead meat now for the purpose of supplying their customers in the hot weather?—Yes, and it increases every year.

6182. And that shows that the necessity of having live animals to slaughter is not so great as it was?—No, there is nothing near the quantity of meat killed in London, in proportion to the population, that there formerly was. Our dead-meat markets are more used now than ever; we can prove that by the annual market returns.

6183. The last witness stated that his impression was that the dead-meat trade had not largely increased; you do not agree with him there?—I can prove differently, because I very often hear of the returns for the day. I know that in Christmas week, which was an exceptional week for quantities and for weight, there were about

Chairman—continued.

about 100 tons more meat sent in than in the year previous. I put a question to the inspector to know what the previous years were like, and he said, "It has increased every year that the market has been opened."

6184. The market inspector told you that the dead-meat supply in the Christmas week had increased every year since the market had been opened?—Yes, but last December it had exceeded all previous years.

6185. Can you give the Committee any idea as to whether the general dead-meat trade has increased since the establishment of the Smithfield Market?—It has increased.

6186. Has it been a steady increase; can you show it by any figures?—Not by figures, but I know it from being there daily.

6187. And, consequently, the retail butcher does not rely so much upon the live animals as he did, but comes more to the Smithfield Dead Meat Market?—Yes, and I think that they are gradually giving up buying live stock; they find that the trouble is very great, and likewise it is more expensive.

6188. And they can come into the market and buy the joints that they particularly want for their customers, which is preferable to having the whole animal, and so creating waste?—Yes, and having a surplus which they cannot sell. They leave those portions with us, and we find ready customers for them.

6189. So that we may gather from your experience, that the dead-meat trade has developed largely within the last few years?—That is positively known.

6190. It is gradually taking the place of the live cattle, the need for which for the retail trade was supposed to exist some few years back?—It is; numbers of the butchers who have slaughter-houses never use them now, and they have not used them for years; I know that as a fact.

6191. You state, of your own knowledge, that a number of butchers have given up slaughtering at home altogether?—Yes; I am well acquainted with this district for a mile and a half round, and there are dozens, scores I may say, of slaughter-houses that have not been used for years.

6192. The butchers, having given up the practice of slaughtering at home, since the increase of the dead-meat trade?—Yes; since this market has been opened, there has been a very great change. There was a time when they could not depend upon a supply in the market; if a man did not buy his meat alive, he could not depend upon having what he required daily.

6193. That change has been assisted very much, I suppose, by the American supply?—I should not think that it has; we always had plenty of meat if the price was sufficient.

6194. Was that dead meat supplied then from the home trade?—In the summer time it would be principally from the live market. A large wholesale buyer would buy, perhaps, 100 beasts, and have so many killed a day, perhaps, to supply the butchers.

6195. Can you speak as to Tallerman's stores?—Yes.

6196. Will you describe them?—When the weather was very cold the trade ran very large; I never saw such a trade in my life, in fact. I never saw in a retail trade anything to equal the amount that was sold.

Chairman—continued.

6197. Where are those stores?—Under the Cannon Street Railway Station.

6198. Do they deal principally in the American meat?—Principally; nearly the whole of it is American.

6199. Have the prices there ruled regularly, or have they varied very much?—The prices to the public were fixed for three months certain.

6200. Have the consignments come over in such a condition as to justify that?—When it was not in good condition they used to have English meat, and sometimes Scotch meat.

6201. The price being guaranteed, it had to be supplied?—Yes.

6202. If the American meat came over in good order that was the market for it?—Just so.

6203. Have you any acquaintance with the Aberdeen trade too?—Yes, I trade largely in that meat.

6204. Can you speak as to whether that dead-meat trade has increased?—Yes, it has increased very largely these last seven years; it has more than doubled.

6205. What sort of quantities of dead meat come in from Aberdeen?—Sometimes 120 tons, 80 tons, 70 tons, 60 tons, 50 tons. We should call 30 tons a very short supply. A supply of 30 tons per day would increase the value, perhaps, 2 *d.* per pound. If we had 120 tons of a morning it would give us a large supply, and it would, perhaps, diminish the value about ¾ *d.* or ½ *d.* per pound.

6206. There is a large dead-meat supply from Aberdeen direct?—Yes, from over the border.

6207. Can you give the Committee any information as to how this meat arrives; does it come by railroad?—By rail and boat. It comes from Aberdeen by boat.

6208. Does it come in any way under the same conditions for keeping as the American meat does?—No, it is thrown altogether; it is laid one on the top of the other, just as you would pack other goods.

6209. What time does it take in arriving after it has been slaughtered?—Meat packed this morning would arrive in London on Friday.

6210. It takes two days to come?—Yes.

6211. And for those two days after it has been killed it is merely packed as closely as possible?—It is sewn in canvas, and put in the vans, and sent to London.

6212. Do you find that it arrives in good condition?—Yes, almost always.

6213. During the hot weather as well as during the cold weather?—Yes; we may perhaps have it come in a bad state three times during the summer, and sometimes twice, but not more. It is dry, and clean, and fresh.

6214. And therefore you have from Aberdeen a very steady supply of sound dead meat already on which we can rely?—Yes.

6215. Has your attention been directed to the possibility of bringing over dead meat from the Continent?—It has from Vienna.

6216. Have you had any consignments of it?—None, I believe, has as yet been sent.

6217. But your attention has been called to it?—Yes.

6218. Have you any reason to believe that there will be any great difficulty in carrying on such

Mr. *Burkett.*

20 June 1877.

Mr. *Burkett.*

20 June 1877.

Chairman—continued.

such a trade?—I do not see the slightest difficulty.

6219. You have not had any consignments of foreign meat of any kind beyond the American meat?—Yes, lots.

6220. From what parts?—From Denmark and from Tonning.

6221. Could you tell the Committee whether those are large consignments?—From Tonning I have had, perhaps, 60 or 70 quarters in a day, or 40, or 100, or 20, or 10, as the case may be.

6222. That would show that a dead-meat trade has already been established with those countries?—Every year we have it from Denmark.

6223. Is there any difficulty in bringing over meat from there?—Yes, I have known instances. We have found a difficulty, perhaps, in August. They commence it rather too soon; I have known it to commence in the second week in August, and that is too soon; and sometimes it has come in bad condition, and has had to be sold under half its value.

6224. But there is no preparation of it?—Not the slightest. It is just put in a sack, and sewn up, and thrown on the deck of the ship, and there it is laid.

6225. And, notwithstanding that, the trade is possible, in your opinion, even under those conditions, excepting during the hot weather?—They can send it without a refrigerator from September until the season finishes, which is about December.

6226. So that there would be no great obstacle in that case in the way of sending the meat over from that country as dead meat?—I do not see any, more especially if they would take more care. I think if the trade increased so as to be worthy of being recognised as a large trade they would pay more attention to it.

6227. Does the meat which comes over in this way as dead meat realise a good profit on the market?—Not since the American meat has come in, because the quality is so much inferior to that of the American meat that it takes quite a second or third rate place; so that I think last autumn they must all have lost considerably by sending it.

6228. Does that apply to Schleswig cattle?—My opinion is, that if we have meat from Germany, and various parts of the Continent, the quality is not equal to the American meat, so that the American meat is sure to take the first place; and it will so reduce the price of the other that they will not be able to send it.

6229. You believe that although the trade is quite possible from those countries, and although a dead-meat trade does exist, to a certain extent, yet the quality of their meat would not make it remunerative for them to send it?—I do not think that it would.

6230. The American meat would undersell it?—Yes, and it would be in better condition. The trade, as a rule, choose that which pleases the best.

6231. How does that apply to the live animals coming from that country; will not the trade prefer the better quality of dead meat even to buying the live animal?—No; persons who eat American meat would not, as a rule, eat it if they saw it raw before they ate it, because it does not look so well as the town-killed meat. It is well known that for the whole of the Government contracts they will not accept American meat, and yet it is the best meat.

Chairman—continued.

6232. They will not take dead meat at all, will they?—Yes, they will take dead meat, but they will not take American dead meat, and yet it is very superior to anything that we have in Europe except the Scotch beef. It is a well-known fact that the workhouses will not receive an ounce if they know it.

6233. You attribute that to a certain amount of prejudice?—It is prejudice.

6234. Notwithstanding that, you say that the American meat, in your opinion, does form a very large part of the consumption?—That I cannot say.

6235. You are not prepared to say that it does; but it is sold to the butchers at the West End, who probably find customers for it?—Yes.

6236. You attribute the failure which have occurred, as I understand you, to the want of knowledge with regard to the preparation process, and those failures, you think, need not continue?—They must end, I should think, because the losses are so great, and the prices are so moderate, that they must remedy it in some form.

6237. Do you believe that the trade will be a continuous trade as soon as they have found out those defects, and rectified them?—I am certain that one man will send it, and that is Mr. Eastman, who has increased his supply now. He used to send 1,000 quarters a week, and now he sends 4,000 and 5,000, because he gets the best price; his meat comes in the best condition, and, in fact, I believe ultimately he will have his own ships.

6238. What line of ships does he send by?—I really have never asked the question.

6239. Have you ever had any consignments from Mr. Hamilton?—No, I have had one from Mr. Toffey.

6240. I thought that you might have been able to confirm Mr. Hamilton's statement as to the condition in which his consignments arrive in London; in his evidence the other day, he stated that he had received it at Glasgow, and had forwarded it for sale in London?—I saw some in our maket on Saturday. They could not use it in Glasgow, and they sent us about 400 quarters in splendid condition.

6241. You saw meat in the market here in very good order which came from Glasgow, having stood the journey from Glasgow after having been taken out of the refrigerator?—Yes.

6242. Do you know whether it was Canadian or American meat?—American; it was Mr. Eastman's meat, but to whom it was consigned I do not know; we knew it by the mark.

6243. Did it fetch a fair price?—No, it did not fetch a fair price.

6244. To what was that attributable?—The market was so full of meat of all kinds.

6245. The market was glutted?—Yes, it was.

6246. I suppose, under the conditions which you have described, as to the possibility of keeping this meat in properly prepared places for a considerable time, the trade would very soon regulate itself, and that gluts such as have been foreshadowed, in consequence of the introduction of the American meat, would not occur?—If there was not so much live meat there would be no glut. Supposing that the live trade was not so great,

as

Chairman—continued.

as a matter of course, it would increase our trade.

6247. Supposing that the live trade was not so great, the difficulty which has been suggested to this Committee is that you would get the meat on to the market all at the same time, and you would have a glut at one moment, and at another time you would have a scarcity; but that under conditions such as you have described, might, I suppose, be regulated by the trade by meat being kept over for the next market?—Yes; I do not know that a butcher has ever come into the market and gone out without being satisfied with his purchases.

6248. There has always been a supply?—Yes, always. It may have been at a very extreme rate, but I do not know of a case where a butcher has been at our market, and has not been satisfied even in the hottest weather. The supply as a rule is very good. I am not saying now that he could buy just what he wanted. If he said, "I want Scotch," or "I want Norfolk," or "I want West Country," but he could get beef or mutton of some description.

6249. And you do not think that there would be the danger which has been described of the market getting glutted by the supply of meat coming in, and being forced to be sold at once?—No.

6250. From your experience, then, you tell the Committee that the dead-meat trade has increased and is increasing, and that therefore we are not so dependent upon the import of live cattle as we were?—We are dependent upon the live trade.

6251. In what way?—If you took away the foreign meat entirely, I do not know what we should do.

6252. We have been talking entirely about dead meat, and it seemed almost that it was to become a supply which would do away with the foreign import?—We should have no mutton at all.

6253. That is with regard to foreign sheep?—Yes.

6254. Does that apply to the foreign cattle?—No, I think that we could do without the cattle entirely. I remember the first month that the German beasts were stopped I saw no alteration at all. It only affected one or two people, and contractors that went in for cheap stuff, low-priced, common meat. Good meat was no dearer, and was not affected in the slightest.

6255. In fact the prices have not been affected as has been stated by one of the witnesses, by the restrictions that have been placed on the Continental import?—Yes, they have been affected in this way: low-priced common meat, what we call contractors' meat, has been much dearer.

6256. Is there a great demand for that low-priced meat?—It is used for all contracts; for institutions; for the Army and Navy, and such like.

6257. They deal entirely in the foreign import?—It is German meat; it is sound good meat, but it is meat that does not do for most people.

6258. It is in the market at a price at which a contractor takes it in preference to any other?—Yes.

6259. And he will not at present take the dead meat instead?—They will not receive anything that is killed in the country; that is prohibited, I believe; whereas the meat might be supplied in a much better manner if they would accept the American meat; but they will have town-killed meat up to a certain weight.

Chairman—continued.

6260. Those are conditions which they impose to prevent their getting a really cheaper and better article?—Yes.

Mr. *Chaplin.*

6261. I think you told us that the imperfect cargoes that have arrived since the 1st of May would be very shortly improved?—I could vouch for one firm that will do so.

6262. What is your reason for thinking so; have you had communications from the other side?—Yes, I have.

6263. And they assure you that it will shortly arrive in good condition?—Yes.

6264. You told us that up to the present time cargoes have varied very considerably as regards condition?—Yes.

6265. When they vary, I gather from you that that is owing to want of care in the process of preparation on the other side, or to want of attention during their transit, or to some accident to the machinery?—Exactly.

6266. To no other cause?—No.

6267. You have given us some very interesting information as to the time that the American dead meat will keep after its arrival both in hot and cold weather; can you tell us how long English meat, killed in the ordinary manner, will keep in comparison with American meat in the summer months?—The American meat will keep the longest after it arrives.

6268. How will it keep in comparison with the Aberdeen meat of which you have been speaking?—That will keep longer than meat which is killed in London.

6269. But in comparison with the American meat?—It will keep longer than the American meat.

6270. Then I understand you to say that the American meat keeps longer than the English meat, and that the Aberdeen meat keeps longer than the American meat?—Yes, as a rule, the Aberdeen meat will keep longer than anything I know.

6271. What is the average price of English beef as compared with the American meat?—If you speak of the best American meat and of the best English meat, I should think that there is 1¼ *d.* per lb. difference; the American meat is the cheaper by 1¼ *d.* per lb. on an average.

6272. As compared with the Aberdeen beef, what is the difference in price?—The American beef is nearly 2 *d.* per lb. cheaper than the Aberdeen beef, and that varies at different periods of the year. I am speaking now of the present time.

6273. Supposing that the live trade was stopped altogether, do you think that the effect of that would or would not be to increase the price of beef to the general consumer in England?—It would increase the price if you stopped the supply of live cattle; if you make the beef dear or the mutton dear, that sends the price up; and so it runs right through.

6274. But I am speaking of stopping the importation of live cattle and not of live sheep; what, in your opinion, would be the effect upon the price that the general consumer would have to pay for beef if the import of live cattle from

Mr. *Burkett.*

20 June 1877.

Mr. *Chaplin*—continued.

the Continent were stopped altogether?—I do not know what would be the consequence, but it would be something serious now.

6275. Assuming, of course, that the American trade in dead meat continues or increases, and that we have dead meat from the Continent, what would be the result?—It would be cheaper.

6276. The effect of stopping the import of live cattle, provided you had dead meat from the Continent and dead meat from America, would be generally to reduce the price of meat?—Yes, it would all be cheaper, mutton, and everything else.

Mr. *Arthur Peel.*

6277. You stated, I think, that the average price of American dead meat had been 6¾ *d.* per lb.?—Since January this year.

6278. Do you know what the average price of American dead meat was last year?—No, my memory will not serve me as to that.

6279. Mr. Link stated that the average price was 6 *d.* per lb. for the carcase?—That confirms my remark; 6¾ *d.* and 5¼ *d.* is 1 *s.*; and if you divide that the average will be 6 *d.*

6280. Therefore the price has been maintained?—Yes.

6281. When you state that that was the average price, I suppose the prices range over a greater extent?—I have known it to make 8 *d.* per lb., and the lowest price that I have known it to make was 2½ *d.* per lb.

6282. Under what circumstances did it make 2½ *d.* per lb.; was it on account of a glut in the market?—No, it was on account of its being in very bad condition. We had some yesterday that made that price, from 2½ *d.* to 3 *d.* per lb.

6283. You sell it wholesale, but you sell it in small quantities, do you not?—Just as it is required.

6284. Do you mean to say that 6¾ *d.* per lb. is the average price that you get from the butcher?—No, I should think not so much as that. If you are speaking of American meat in general, I should think that the average price during this last 12 months would be from about 5 *d.* to 5¼ *d.* per lb., taking the bad cargoes with the good ones.

6285. The butcher buys it from you at that price?—Yes.

6286. Do you think it is possible that what Mr. Link, with whom you are connected, says is true, viz., that that meat is consumed by the better class of people in London, and not by the poor?—Not to take it generally. When it comes in good condition, then it is used for the best parts of London, because it is equal to anything that they can get; in fact, there is nothing to equal it in London now.

6287. Mr. Link stated, I think, that it was bought as the best Aberdeen meat; can you speak as to that at all?—I cannot.

6288. You do not know what becomes of it when it gets into the retail market?—No.

6289. You stated, did you not, that the Government contractors and workhouses altogether rejected American meat?—I know they do.

6290. Are you sure that you do not mean Australian meat?—No, I mean American meat.

6291. Are you in any way connected with the Australian trade?—Yes.

Mr. *Arthur Peel*—continued.

6292. Have you not imported Australian meat largely?—Yes.

6293. Was not a great objection made to the appearance of the Australian meat?—Yes; it was sold for Australian meat, but it was not Australian meat.

6294. Are you aware that the workhouses reject Australian meat, because the paupers would not touch it?—Yes; but I do not believe that it was Australian meat.

6295. What was it?—It was South American meat.

6296. You think that they have the same objection to American meat?—I should think it must follow that such is the case.

6297. Then the appearance of the United States' meat is so bad, that if you saw it you would not touch it?—There is such a striking contrast between the appearance of American meat, and that of town-killed meat, that I have no doubt that gentlemen when they saw it would not fancy it.

6298. Then what becomes of all that we have heard of the beautiful bloom on the meat?—It would very soon dry, and lose that in the course of six or eight hours.

6299. Would it become so nauseous to look at that people would not like it?—I do not say that, but you would know in your own mind what English meat looks like, and if you saw any change of colour you would certainly object to that; I am speaking from experience; but most of the people who have this American meat at the West End do not see their meat until it is dressed.

6300. You think that if they did see it they would not buy it?—I do not think they would.

Colonel *Kingscote.*

6301. You said, did you not, that the Aberdeen meat would keep better than the American meat, and that the American meat would keep better than the English meat?—Yes.

6302. What is your reason for saying that?—I can give you a satisfactory reason, I think. The Scotch beasts, as a rule, are not driven very far, and they are cool and not at all heated; that is the principal cause of the meat keeping well.

6303. That confirms what Mr. Gillett, I think said, that the meat which was killed in America was, to a certain extent, prepared for death and cooled; but you have told us that the Aberdeen meat comes packed one carcase upon another?—Yes, six or seven deep.

6304. Do you think that that is as good a way of carrying it as hanging it up?—I should think not.

6305. If that meat was brought from Scotland in railway trucks, and hung up, with plenty of ventilation around it, do you think that it would keep much better even than it does now?—Much better.

6306. But of course it would be more expensive to bring?—It would be more expensive to bring.

6307. Would the extra freight exclude it from the market?—It is quite dear enough now; I believe it is about 4 *l.* per ton.

6308. Before the American meat came over in large quantities, was the Aberdeen trade increasing or decreasing?—I cannot remember.

6309. It is now fast decreasing, is it not?—You may say that the season has finished; it has its

Colonel *Kingscote*—continued.

its season. Speaking of the 12 months it has increased.

9310. How has it increased in the face of the price of American meat, which you say is very nearly as good as the Aberdeen meat?—In the first place they cannot consume it if they keep it; the population is not great enough in the northern parts of Scotland. I can give you no better proof of it than by saying that I can remember the time when there were about eight or ten Scotch meat-salesmen, and now, I suppose, there are upwards of 50.

6311. So far as you can judge at present, the increase in the dead-meat trade from America will not affect the Aberdeen trade?—Only to bring it down in price.

6312. But not in quantity?—Not in quantity. What it may eventually do in the course of two or three years, I do not know, because they must sell the beasts that they have now, but whether they will then turn their attention to other farming operations is a matter that I cannot go into.

6313. You say that the butchers are increasing, by using dead meat and doing away with slaughter-houses?—That is so in London, no matter which district you take.

6314. Why is that?—They find that it is less expensive.

6315. I thought the butchers made a good deal of profit by what is called the fifth quarter?—Yes, but that is charged for before.

6316. I think you said that you were agent for Tallerman's?—No, I have supplied him with meat for that place for about three or four weeks.

6317. Do you know whether he is going to establish another West End depôt?—I believe that he is not going to do so now, but I hear that there is a very large establishment to be opened in about six months time.

6318. I think you said that sometimes, owing to their having entered into a contract to supply meat at a certain price, they have been obliged to buy Aberdeen meat?—Yes.

6319. They must have done that at a heavy loss, I suppose?—Decidedly.

Mr. *Anderson.*

6320. With regard to contracts, do you speak from personal knowledge when you say that the American imported meat will not do for those contracts?—No, I said that it would do, but that they would not receive it.

6321. Neither the War Office nor the Admiralty?—No.

6322. Do you know whether it has been tried?—I do not know. I have not been present.

6323. You believe that to be nothing but prejudice on the part of those offices?—I know the quality of the meat.

6324. And you know that it comes to this country in such a state that it will still do for curing?—Yes.

6325. Will they neither receive it for consumption fresh, nor for curing purposes?—They will not receive it at all; it is prejudice; they will not even investigate the matter.

6326. They have never tried it, in fact?—No. They have had a quantity, you know, but they do not know it.

Mr. *Anderson*—continued.

6327. Then they are receiving it without being aware of it?—Yes, but not in any great quantity. If it comes in in very nice condition it is too dear for contractors' purposes.

6328. Does that apply also to workhouses, hospitals, and institutions?—Yes, they all refuse it without trying it, really, if they know it is American beef.

Mr. *French.*

6329. I understood you to say that you were entering into an arrangement for carrying on a dead meat trade with Vienna?—Yes.

6330. When is that trade likely to commence?—I do not think that it will come to anything, because I believe that the parties who are interested will not risk the cargoes themselves, and they wish the parties who are to receive it here to be answerable for the condition, and as it is an experiment, it would, perhaps, create a loss.

6331. If people could be got to agree with each other, you think that all the requirements, such as ice and everything of that kind, could be got easily enough there?—I should think so.

6332. There is no difficulty then in the way except that of individuals making arrangements amongst themselves?—Not the slightest, because for nine months in the year we have the meat from Hamburg without any preparation at all; it is merely laid upon the ship's deck.

6333. Do you think that in case of the importation of live cattle from the Continent being stopped, the import of the American meat is likely to be increased so as to make up the deficiency in the supply?—Certainly it is. If the prices advanced here the supplies would increase tenfold, no doubt.

6334. The prices would lower again when the market came to right itself?—Certainly.

Mr. *Chamberlain.*

6335. You say that the dead meat trade in the central market has increased; and I think the Chairman asked you whether it was not taking the place of the live cattle trade; do you think it is?—No, I do not think so.

6336. You think that, in fact, it is only that the slaughtering is now done wholesale instead of separately by the different butchers?—It is now done wholesale.

6337. And probably there are still as many live cattle in stock for slaughtering as ever there were?—I should think so; more than would take twelve months.

6338. Do you have any consignments of dead meat from Ireland?—Yes, I have had pork.

6339. But not dead-meat cattle?—No, I do not think that I ever saw any.

6340. Do you say that the consignment of beef from Scotland is increasing?—Yes, every year.

6341. In comparison with the live trade?—Yes, I should think they all run together as regards the increase.

6342. Why do you think that the dead meat is sent; is it cheaper to send dead meat than live cattle?—They save the loss in weight which they would have if it were sent alive.

6343. Do they get as much for the offal in Scotland as they would in England?—No, but they make more of the meat, because meat killed in Scotland eats much better than meat killed in

Mr. *Burkett.*

20 June 1877.

Mr. *Chamberlain*—continued.

London. It makes the highest price of anything that we have; it far exceeds anything. If it is a short supply, it will run, perhaps, 1½ *d.* per pound beyond anything we have in the market.

6344. If it is to their advantage to send dead meat, I want to know why the live cattle trade does not, in fact, altogether cease?—The number of live cattle that came from Scotland is not very great. Even in the season, 500 on a Monday is considered a quantity.

6345. Do you think that the proportion of dead meat from Scotland in comparison with live meat has increased within the last ten years?—I should think that there is more dead meat. As I have already stated, I remember the time when there were only 10 or 12 Scotch salesmen, and now there are 40 or 50.

6346. I suppose the live cattle trade has also increased during that time?—I cannot answer for that.

6347. Do you know whether the proportion of dead meat to live meat has increased during that time?—I do not know.

6348. Do you know why more dead meat does not come from Ireland?—I should think in the first place the quality is not good enough.

6349. Will you explain that?—It would meet with a very poor sale.

6350. Do the live cattle meet with a very poor sale?—No, they would meet with a better sale.

6351. I do not quite understand you?—The Irish meat as a rule, is very thin, and it is meat that does not eat well; and the consequence is that it would take, as regards price, about a third or fourth place.

6352. But if the cattle is poor, that would affect the price of the live cattle as much as the price of dead meat, and I do not see that it would affect the proportion when you have to consider whether you would send it dead or alive?—I have no doubt that it has been tried in the winter time, but I do not remember it. If the quality was good enough, and it paid, they would be sure to send it, because it is no great distance.

6353. You say that some dead meat comes from Denmark?—Only for about eight or ten weeks.

6354. Do you know whether that meat is killed voluntarily for the dead-meat trade, or whether they are only weak and inferior beasts?—They are inferior beasts that are slaughtered.

6355. Are they slaughtered only because they cannot bear the journey alive?—I should think that they are very old cows, as a rule; rough common meat.

6356. Then it is not really a fair experiment?—It is as regards the condition they come in.

6357. But the condition you told us was very bad?—For the first portion of the season. They generally send it about the second week in August and finish up about the third week in November.

6358. Is it good during any part of that time?—Sometimes, if the weather is good here.

6359. But during the time that they do send it is generally bad?—Yes, in the first part of September; that is a very bad month, but I have known it come sweet even in that month.

6360. You say that you think you could do without live cattle entirely; but I understand you to say that, if it were now suddenly prohibited, it would involve a very heavy increase in price?—Yes; I wish to explain myself thoroughly there. If you stopped the foreign cattle from coming, and if they did not kill their meat and send it dead, the meat would go to an enormous price; to something like 20 per cent., I should think. We are very much dependent upon them at the present time.

6361. I think the honourable Member for Lincolnshire asked you, however, whether, if dead meat were substituted for live cattle, it would make any difference, and you said it would not; but do you think that such a substitution is likely to take place?—I do not understand the question.

6362. Of course, if a corresponding amount of dead meat were substituted for the live cattle prohibited, there would be no difference in the price?—It would be cheaper, because directly it arrives here it must be sold within a day or so.

6363. But do you think that such a substitution would take place?—It would for a short season, but I think, as the last witness said, that ultimately they would not send at all.

6364. Therefore you think that ultimately the result of prohibiting live cattle would be to increase the price of meat in England about 20 per cent.?—Then we should have to depend upon other sources for our meat; upon America, perhaps, unless it got much dearer there.

6365. You would expect that the export of dead meat from America would in that case increase?—I should judge so, because the price would increase the consignments, and it would pay better.

6366. But it would drop off again the moment the price fell, and it would only increase if the price increased?—Certainly.

6367. And, therefore, it still follows that there would be an increase of price, although, perhaps, not 20 per cent?—I should think meat would be very dear if they stopped the foreign supply. They must send something for a season, because they cannot consume what meat they have; but after they have sold their stock, I think they would turn their attention to some other pursuit.

6368. You could not in any case do without the importation of live sheep?—I think it would be impossible.

6369. Why do you think it would be impossible; why should not mutton be imported dead as well as beef?—They do not stand the test so well.

6370. Do you mean that the mutton arrives in worse condition than the beef?—Yes, it is not thick enough to stand the operation. I think that mutton might be brought from the Continent fresh enough, but it is a failure from America, unless they have some other process. It is only about four days, or at the most five days from the Continent, and they could bring it fresh enough if proper care was taken.

6371. If it were proved that you could not keep out disease without prohibiting the importation of live sheep as well as of live cattle, you would say that you would not prohibit either?—No, I should think not.

6372. As I understand, up to the present time, there have been very great variations in the quality of the dead meat coming in from America?—Not in the quality so much as in the condition.

6373. You

Mr. *Chamberlain*—continued.

6373. You think that that might be overcome?—It will, no doubt.

6374. But it has not been overcome yet with 18 months' experience?—No; but the best proof is, that each man will have a fresh consignment of meat occasionally that we are all astonished to see.

6375. I understood you to say that some of the last consignments that you received were some of the worst?—Yes, they vary. There are about seven or eight men sending now from America. At times each man has a fresh consignment of meat, but one man in particular as a rule has it fresh, and that is Mr. Link.

6376. But even Mr. Link has it sometimes bad?—Yes, he had some to-day not very good.

6377. Do you know anything about the quantity of American meat consigned to this country?—I have not the slightest idea.

6378. Do you know that it has been very much less in this month than in the preceding months?—I should judge that it was so; they are not consuming so much in the provinces, I believe.

6379. I understand that in June you consider that the consignments are very much smaller?—Yes, I know from experience that they are.

6380. And you know that it is not being taken in the provinces now?—Yes, not so much.

6381. Why is that?—The public do not like meat when it is not fresh; they prefer paying an extra price, and having what they like, fresh killed meat; it does not look well; as soon as the weather changes, the meat changes in colour, and the public set their minds against it.

6382. And you think that we in the provinces do see the meat before we eat it?—Yes.

Mr. *Elliot.*

6383. Did I correctly understand you to say that it takes four or five days to bring dead meat from the Continent?—From some parts five days, and from some parts two or three days.

6384. How long does it take to bring live animals from the Continent?—I suppose from Vienna it would take from four and a half to five days.

6385. How long does it take from Hamburg?—About two days.

6386. Then it is about the same distance as from Aberdeen to London?—Yes; I should think it is about the same distance.

6387. Have you had any dead meat which has come from the Continent in very hot weather?—Yes, I have had meat from Denmark in August.

6388. Is it not very much affected by heat?—I have been surprised at its being fresh, but it has been sound.

6389. Has it been as good as the American meat, as far as condition is concerned?—Yes, it has been as good as the American meat, as far as condition is concerned.

6390. Then, in your opinion, it is not necessary, so far as the continental trade is concerned, to have any refrigerating process, such as the American meat requires?—Not in the winter time.

6391. But you say that the meat comes in the hot weather fresh, and therefore it would not be necessary to have any refrigeration during the summer?—Yes; but if you carry meat upon the deck, single, in small quantities, the cold air there would preserve that meat; but if you pack it 10 or 20 in a case, one upon another, you would not be able to get much air through it.

Mr. *Elliot*—continued.

6392. It has been alleged that the want of ice is one of the difficulties in bringing meat from the Continent; it would not require so much ice in proportion, would it, as it does from America?—It must go through the same process in the summer time.

6393. Do you think that the offal could be brought with the rest of the meat?—Yes.

6394. Could it be brought perfectly fresh to the English market?—Yes, we have had the offal from America, so we take it for granted that it could be; I have had quantities of it. When you speak of offal, I am speaking now of hearts and tongues.

6395. The eatable part?—Yes.

6396. That meat has been perfectly fresh?—Yes.

6397. Has it sold at a price that the poor could buy it at?—Yes, they have purchased it.

Mr. *King Harman.*

6398. You say that, in towns, a great many of the butchers have a sort of storehouse, which is to a certain extent refrigerated?—Yes, most of the butchers have.

6399. Do you believe that in case the American trade should assume very large proportions there would be any difficulty in having storehouses of large size in which a sufficient quantity of meat could be kept to prevent the market being glutted?—That would have no effect upon meat that is in a bad condition beforehand; but with regard to meat in good condition, certainly it would.

6400. Supposing that large store-houses of that kind were established at Liverpool, so that there would not be any great length of time between the time that the ship's store was opened and the time that the meat could be placed in a store on land, do you think that under those circumstances the meat could be kept for a sufficient length of time to enable the market to be regulated?—Certainly it could.

6401. And you anticipate that something of that kind would be done?—No doubt it will be done at both ends, both in London and at Liverpool. It frequently happens that they will not allow a ship to remain any longer, and they are obliged to clear the ship and send the meat up to London.

6402. Do you know anything at all about the Irish fat cattle trade; the honourable Member for Birmingham was asking you why the Irish dead meat did not come more into the English market?—A quantity of sheep and pigs come, but nothing else.

6403. Do you know as a matter of fact that the fat cattle in Ireland come to the butcher chiefly in Dublin?—I was not aware of it.

Mr. *Jacob Bright.*

6404. Have you long been connected with the meat trade?—For about 28 years.

6405. During that period of 28 years, has not the tendency been for meat constantly to rise in price?—No, it was dearer in 1846, and it was excessively dear in 1854, 1855, and 1856, during the Russian War.

6406. That was from special circumstances?—Yes. Then it was dear in 1861 again at the time when we had the rot in the sheep.

Mr. *Burkett.*

20 June 1877.

Mr. *Jacob Bright*—continued.

6407. But apart from those special circumstances, the tendency has been for it to advance?—Yes, it is much dearer.

6408. Are there not great complaints on the part of the consumers throughout the country, that meat is dear and scarce?—Yes, I believe that there are.

6409. Do you regard meat as a necessary of life?—I think it is a necessary of life.

6410. Do you not think that it is a good thing to have all necessaries of life as abundant as possible?—Yes, I do.

6411. And to have them as cheap as possible?—Yes, I do.

6412. If you increase the quantity of an article, does it not tend to diminish the price?—Always.

6413. And if you diminish the quantity, does it not tend to increase the price?—Immediately.

6414. I do not understand how, with these views of yours, you could say so positively, as you have said to this Committee, that we could now do without foreign cattle?—I will explain that; perhaps I did not explain it enough in your hearing; I meant that, as regards the foreign cattle, if we do away with them alive we must have them dead; they must come; we cannot do without them I am positive.

6415. We could do without live foreign cattle if we had them dead; but do you fancy that a great dead-meat trade could be readily organised, so that as it were by an Act of Parliament you could get rid of the import of live cattle?—I believe that in the course of six weeks from to-day we could have enough meat from America to supply all we wanted and do away with all the Continental meat entirely.

6416. That is your opinion?—Yes; you asked me my opinion.

6417. But you would not, on a mere prophecy, begin to deal capriciously with the food of the people?—I would not. I believe that it would be a very serious thing to stop the cattle coming from the Continent.

6418. Did you not tell us that the exportation of dead meat from certain portions of the Continent had ceased to be profitable, owing to the American meat being so superior?—It really is not required only to come to some minor place, scarcely worth anything, you may say.

6419. It is cut out, in fact, by the American meat being superior?—Entirely.

6420. In that case, if we are to get the meat from those portions of the Continent, it must come alive or not at all?—I should think so.

6421. If that be so, surely you could not adhere to your statement that we could now do without live cattle from the Continent?—I have explained to you just now that what I meant was, that if we stopped the live cattle coming we must have the same quantity of beef come dead. It does not matter whether it comes from America or from there.

6422. But you have admitted that it will not come dead from those parts of the Continent, because of its quality?—I should judge not. They might try it, but it would not last, because it would make so much less per pound.

6423. You admit, of course, that to cut off supply anywhere is to enhance price?—Yes, immediately.

6424. Putting the case of sugar, or wool, or cotton, or any other article, if you said, "Oh, we have a great supply in this country, we need not care for that supply." You would, by diminishing the supply, increase the price, would you not?—No doubt.

6425. You admit that there are probably millions of persons in this country who get very little animal food?—Yes, I should think so.

6426. And who would get it if it were 5 per cent. cheaper?—I think that there are hundreds of thousands who have had it cheap enough in these last two years in London, who have never had it before.

6427. Is it the consumer who has had it so cheap, or the butcher?—The consumer.

6428. That is to say, when the butcher gives 3 *d.* per pound for his meat, he sells it very low?—Yes.

6429. Speaking generally of the country, is it not so?—No, it is only in London. I think that the poor of London have had a great boon in the price of meat.

6430. Seeing that meat is constantly advancing to a very stiff price, do you not think that there would be intense jealousy on the part of the people of the country if you cut off any of their supplies?—Not if the price was not enhanced.

6431. Have you had American meat in the market regularly the whole of this year, every day?—No; sometimes we have been three or four days without any.

6432. When that is the case, you still have to supply your customers, I suppose?—Yes.

6433. In that case you buy English meat?—Yes.

6434. What is the lowest price you have ever given for English meat when you have had to buy it, when you have been short of American meat?—Sevenpence per pound when there has been no American meat.

6435. When you have been short of American meat you have never supplied yourself with meat at less than 7 *d.* per lb.?—I should think not.

6336. Is there not a common kind of English meat that does sell at less than 7 *d.* per lb.?—Not English; German, or Danish or Dutch.

6437. But not English?—Not as a rule. You are speaking of oxen, I presume?

6438. I am speaking of beef and mutton?—That is a very wide question. There are about seven or eight qualities.

6439. But you are not accustomed to buy those lower qualities?—No; but we have all manner of qualities in our market. If you speak of oxen, there is nothing lower than that.

Mr. *James Corry.*

6440. Have you seen any of the American live stock that have been imported into this country?—Yes.

6441. How do they come?—They are very good indeed. Very fine beasts, larger than ours, as a rule.

6442. Are they killed immediately on landing?—Oh, no; they are kept sometimes a week, according to the convenience of the purchaser.

6443. I have heard that a considerable number were landed at Southampton, and I know as a matter of fact, that a great many are coming from Canada to Glasgow regularly every week. Do you think that that trade might be increased during

Mr. *James Corry*—continued.

during the summer months?—I do not know the expenses that are attached to it. I am told that the expenses are too great for them to be sent alive.

6444. Are you aware whether the navy is supplied with American salt meat?—I am not aware of it.

Mr. *Torr.*

6445. You began by giving us a description of Mr. Link's imports chiefly; do you know his import better than that of any other consignee?—No; I know the others because I see all the consignments that come in.

6446. Were you present when Mr. Link gave his evidence?—I was never here before to-day.

6447. Probably you are aware of the purport of his evidence?—I am not.

6448. He gave an assurance to this Committee that the import of American beef would continue to increase to a very large extent; has he ever made communications of a similar purport to to you?—Yes, I have heard that; I know that six months ago that was their intention

6449. You are aware that for five months we have had no import of German cattle owing to cattle plague?—Just so.

6450. Do you not think that the suspension of the German supply had some influence upon the American dead-meat supply?—Yes; I think that it had.

6451. You stated in direct terms: "I think we could do without the German live cattle altogether"; was it following out that idea that you had got from Mr. Link, that if it were suspended, you would have not only a large but a rapid increase in the import of American dead meat?—Yes.

6452. Was that the basis of your expression?—Partly. Then I should certainly expect that if they did not send their beasts alive from Germany they would send them dead.

6453. You have no reason to suppose that they would not send them?—They will do so; they have done so for years already.

6454. And consequently you are under no alarm that if that German supply of live cattle were suspended, this country would suffer materially in its supply of beef?—We should certainly have to depend upon America; they could supply all the deficiency.

6455. You are still then of the same opinion as you expressed, that this country would be supplied, and amply supplied, with beef from America and elsewhere, if the import of live cattle from Germany were suspended?—Yes; I think that we should be very short for the first two months, until they were in a position to send.

6456. You are aware that the only object of suspending the import of live cattle from the Continent would be, if possible, to stamp out the diseases from which our home herds suffer?—Yes.

6457. Do you not think that if that could be effected, our home supply of beef would be very materially increased?—I feel confident that it would. I think that it would give a spirit to the farmers to breed and fatten.

6458. If a moderate per-centage of increase of our home supply, which, of course, is vastly larger than all our imports of foreign meat put together, could be effected, it would eventually

Mr. *Torr*—continued.

make beef cheaper in this country, would it not?—Certainly it would; and we should have a better quality for the public.

6459. And at a lower price?—Certainly.

6460. I understood you to say just now, that the Germans have now, for some years already, sent over meat dead?—Yes.

6461. Are you able to speak of it as having been consigned to you?—No; but I have seen it come past my place.

6462. Have you seen it in any quantities?—I have known 2,000 quarters in a week at the most, and the least, perhaps, was 50 quarters from Hamburg. It has been for years in existence.

6463. And that would lead you to think that such a trade could exist if the live import were stopped?—That is the point. They send generally from the commencement of November up to the first week in June.

6464. You said that we were very much dependent upon the foreign live stock at the present time, and that prices would go up 20 per cent. if it were limited; has there been any perceptible rise in prices in consequence of the diminution of the foreign import from the restrictions preventing the cattle from coming here?—Yes; the common meat has risen, I should think, $\frac{3}{4}$ *d.* per pound.

6465. But I understood you to say that the supply to London had not risen in price?—Good meat has been no dearer.

6466. The consumer who depends upon the lower class of meat has suffered?—Yes; the consumer who depends upon the lower class of meat has suffered materially.

6467. And it was that which you meant to say when you said that the price would go up considerably if the import of foreign live stock was stopped?—As soon as the common meat becomes dear, it raises the price of the best meat.

6468. What was the price of the common meat?—It varies; there are many prices; some of it is 6 *d.* per pound, some 5 *d.*, some 5½ *d.*, and some 6½ *d.*

6469. Has the American trade not taken the place of that?—No; simply because they cannot use it for the same purposes; they will not have it. This common meat is used for contracting purposes, as a rule.

6470. But setting aside the contractor, has the general public suffered, seeing that the American meat has stepped in at a time when we have been restricted in our foreign importations?—I should think not in London.

6471. You say that the consumers generally, setting aside the contractors, have not suffered by this diminution of foreign supply, because the American meat has come in and filled the gap?—The general public have not suffered.

6472. And then you say that the people who are supplied by the contractors have suffered, because the supply of the class of meat which the contractors take and on which they depend, has been diminished?—Yes.

6473. If you got over the prejudice which made the contractors limit their purchases to this foreign supply and enabled them to buy in the dead-meat market, which is as cheap as the foreign supply, would those poor people whom I understand you to say the contractors supply, have been prejudiced at all any more than the

Mr. *Burkett.*

20 June 1877.

Mr. *Burkett.*

20 June 1877.

Mr. *Torr*—continued.

general consumer?—It certainly would have an effect.

6474. You have allowed that although the foreign import has been stopped, or practically so for a time, the general consumer has not suffered; but you say that the people who are supplied by contractors have suffered?—No, I do not say that they have suffered; the contractors have suffered.

6475. Then who is the person who you say has suffered a loss in consequence of the foreign importation being stopped?—It is the contractor who would lose in that case, not having the goods according to his contract.

6476. Supposing that you got his prejudice as to the American meat, and opened the trade, the contractor would not lose if he could buy American meat, would he?—Not if he could use

Mr. *Torr*—continued.

American meat, and if they once get over the prejudice.

6477. When the question of prejudice is done with, there is no reason to say that the consumer will suffer at all by the restrictions that have been placed upon the import of foreign stock, because that diminution of stock has been met by the dead-meat supply?—Certainly.

6478. And that is a state of things which has been going on now for nearly five months, and the prices have not risen in that time?—No; not to the general public.

6479. Has your attention been called at all to any efforts that have been made in Schleswig with a view to preparing a dead-meat market, in consequence of the Order in Council which has just been issued obliging them to come to the Deptford Market?—No.

Friday, 22nd June 1877.

MEMBERS PRESENT:

Major Allen.
Mr. Anderson.
Mr. Assheton.
Mr. Jacob Bright.
Mr. Cameron of Lochiel.
Mr. Chamberlain.
Mr. Chaplin.
Mr. Dease.
Mr. Wilbraham Egerton.
Mr. Elliot.
Mr. W. E. Forster.
Mr. French.
Mr. John Holms.
Sir George Jenkinson.
Mr. King Harman.
Colonel Kingscote.
Mr. Murphy.
Sir Rainald Knightley.
Mr. Arthur Peel.
Mr. Ritchie.
Sir Henry Selwin Ibbetson.

SIR HENRY SELWIN IBBETSON, BART., IN THE CHAIR

Mr. JOHN GIBLETT, called in; and Examined.

Mr. *Giblett.*
22 June 1877.

Chairman.

6480. YOU are a Cattle Salesman, I believe, in the London market?—I have been engaged in that trade for nearly 50 years; I never have any cattle of my own; I am exclusively a salesman.

6481. As such, I believe you have dealt largely in cattle imported into England?—Yes; more so than most people.

6482. Your attention has naturally been directed to this inquiry, and to the questions that have been raised before this Committee as to the continued import of cattle from foreign countries?—Yes.

6483. The consignments to you are very largely from Spain, Portugal, and America, are they not?—From Oporto, from America, and from France; the consignments from France used to be very large.

6484. That importation from France, at all events, of course is now stopped; but was it a large importation during the last two years?—Within the last year our firm sold 2,000 beasts from France.

6485. That is during 1876, before the prohibition issued?—Yes; and in the year before we had very large quantities of fine cattle, particularly at Christmas time.

Colonel *Kingscote.*

6486. Were they all live cattle?—Exclusively live cattle, with the exception of the American meat which happens to be sent to us, which we distribute to other people.

Chairman.

6487. Confining ourselves to the import of live cattle, first of all, have the consignments to you of French cattle fallen off within this last few years?—Very much.

6488. To what do you attribute that?—To their being obliged to go to Deptford.

6489. Have they been for very long obliged to go to Deptford?—Yes; for the last two or three years.

Chairman—continued.

6490. French cattle have been treated as cattle from a scheduled country, and slaughtered at the port of debarkation?—Yes.

6491. And you would represent to the Committee that that fact has diminished the exports from France?—Very largely.

6492. Can you give the Committee any figures from your own experience, showing what the export from France to this country was before and after the cattle had to be slaughtered at Deptford?—About ten years ago myself and my son, that is to say, our firm, sold 9,998 French beasts in one year, and they averaged 27*l.* each; that is within two of 10,000 oxen from France alone.

6493. That was prior to the restrictions with regard to slaughter at Deptford?—Yes.

6494. Can you give the number subsequently to those restrictions being imposed?—After trying it two or three times, the large dealers determined not to send any; but, however, they altered that determination, and within the last year we have sold 2,000.

6495. I understand you to say that though on the first starting of the Deptford Market the French trade almost ceased, it has subsequently come back again to this country, to a certain extent?—To a small extent.

6496. And you say that you sold about 2,000 last year, as compared with 9,998 ten years ago?—Yes.

6497. Then the fear of the Deptford Market has not entirely crushed the trade there?—Not entirely, but very much so.

6498. Have the consignments to you from Spain or from Oporto been as large as your French consignments?—I estimate that we had through the year about 30,000 cattle coming into England.

6499. That is, from Oporto?—From Oporto and Spain. Many of those are very large and good

Mr. *Giblett.*

22 June 1877.

Chairman—continued.

good oxen, and the smaller of them are very generally used, and are almost necessary for the Army and Navy.

6500. You mean that contractors buy the Spanish and Portuguese import very largely?—Yes, and they have proved to be more sound than beasts from any other country; England, Ireland, or Scotland.

6501. You state that, from your own personal knowledge, from their passing through your hands, and from the way that they are bought?—The proof is in the practice. There are no persons so particular as to the healthfulness of the meat they kill as the Jews. Of those cattle that come to London (and in our firm we have sometimes 10,000 or 12,000 a year), the Jews buy more than half. Why? Because they are more sound than any other beasts; the lungs are more clear; the lights do not adhere to the sides of the beast; there is no pleurisy.

6502. We have had evidence that the German and other foreign exports, which have been referred to before this Committee, are of animals which sell at a cheaper rate than the English animals; can you tell the Committee what is the price per pound in the market of Spanish and Portuguese animals?—Very generally they make nearly as much as the very best English beasts, and if you will allow me I will explain the reason why. The offals are worth so much more money, and the hides are worth more than twice as much just now as those of the English oxen. Last week I saw the hides of some of those animals sold at 3 *l.* each, and that is a good deal more than the hides of English oxen fetch, and therefore they make so much more per pound, or, as we term it, 5 *s.* 8 *d.* to 6 *s.* per stone alive.

6503. That would range with the price of the home supply?—Entirely.

6504. And it differs in that respect from the other foreign supply as to which we have had evidence?—Yes, in consequence of the offals being worth more; and the quality of the meat of some of those Oporto beasts is as good as that of any beasts in the world; I mean, of course, the youngest and best.

6505. With regard to the Spanish and Portuguese exports, we have not suffered in this country from disease imported from those countries, I believe, but they have been declared to be free of disease generally?—Generally, but they have been subject to foot-and-mouth complaint, and in their case we have deemed that they have been very cruelly, and, as has been admitted, most unfairly treated, as compared with the way in which many other countries are treated.

6506. You mean that the restrictions which exist with regard to the slaughter of the cargoes on one animal being detected suffering from foot-and-mouth disease have operated very severely as against the Spanish and Portuguese export?—They continue to send a large number of animals.

6507. But you say that those are the restrictions which you think have acted severely upon the trade?—Yes, they have acted very severely, but still they have not annihilated the trade.

6508. You would represent to the Committee, from your own knowledge, that the restrictions that exist as to foot-and-mouth disease with regard to foreign animals, press very severely upon this Oporto trade?—Yes. Several cargoes that have been sent to us have been stopped, because one or two animals have proved to be affected; and in some cases they were thought to be affected where it was afterwards proved that they were not.

6509. Are those the points which you present as hardships, because when they were proved to be affected that would apply equally to the whole foreign imports?—Just so; but there has been hardship and injustice in that particular case as I describe. You will excuse my speaking emphatically; my object was to give a most distinct and explicit answer.

6510. We have dealt with the French and the Oporto animals; with regard to other imports, have you imported live beasts from America?—I have had them consigned to us from America.

6511. Were they consigned to you at Southampton?—Yes, lately. I could give you an account of every ox by reference to these documents that I have in my hand. I keep having them every week in large quantities.

6512. Is that import into Southampton from America an increasing trade?—Yes, the practice of sending them to Southampton is increasing.

6513. In what sort of condition do the animals arrive from that country?—Almost all that we have had, and we have had many hundreds lately, come in very good and sound condition. On an average, not more than two or three are injured in a cargo of 180.

6514. Is that an average taken over the whole year or only over the five summer months?—It is not found to answer to risk sending large quantities of animals alive except during the fine weather.

6515. You believe that the trade would not be a continuous trade throughout the year, but that it would be a trade limited to the time when the passage was tolerably calm?—That is their intention, I know.

6516. Those animals have come over, you say, generally in very good order; do they fetch a remunerative price as compared with the other animals that you have spoken of?—They make considerably more per head. I think that the 2,800 that I have had from America within the last year have averaged from 29 *l.* to 30 *l.* each. Yesterday I sold 90 American oxen in the market; they came from Southampton, and they fetched 29 *l.* each, all but 20 *l.* on the lot; and we have the remainder, 170, which will realise in all probability 32 *l.* or 33 *l.* each; they are most excellent meat.

6517. Have you had consigned to you any of the dead meat from America, so that you are able to compare the two?—Yes, during the last three months I have had about 2,000 quarters of beef altogether, and I have the account here of the very price that each made. I can give you exactly what they make alive, and what they make dead, and not, as some witnesses do, their opinions as to what they might or would make.

6518. I suppose you can state with regard to one consignment that which would show us pretty nearly the general history?—Yes. By the "Greece," on the 20th of June, there were 568 quarters which have been sold, with the exception of a few, at the price of 3 *s.* 5¼ *d.* per stone, which would be about 5 *d.* and a fraction per lb., not quite 5¼ *d.* per lb.

Some

Chairman—continued.

Some of the oxen which came by the same boat I sold yesterday at 5 *s.* 8*d.* to 6 *s.* per stone, which would leave those carcases of beef to stand the butcher in 5 *s.* 4 *d.* per stone, which is 8 *d.* per lb.; so that, in fact, although the weather has not been so very hot yet, we conclusively prove that in this case that the beef makes 3 *d.* per lb. more alive than dead.

6519. Do you mean that the live animal with its offal stands at that price to the butcher?—No, it makes from 5 *s.* 8 *d.* to 6 *s.* per stone alive, and by valuing the offal at what it is worth, that would leave the carcase at 8 *d.* per lb.

6520. The offal is, of course, a separate item as it does not come over with the dead meat?—Yes. It leaves the carcase at 8 *d.* per lb. But we have had many other cargoes. I have here the particulars according to the sale from the different wholesale butchers to whom we send them, because we do not sell this dead meat personally ourselves. On the 1st of June we had 550 quarters, and the price of the meat was 4½ per lb.

6521. Was that the price at which it was sold as an average for the whole quantity?—Yes. I have an account here of 20 odd oxen which came by the same boat, and which were bought by Mr. Cope, and sent into the dead meat market; and the average price that the carcases of live oxen made was 5 *s.* 2 *d.* per stone, that is 7¾ *d.* per lb. Then we had another case where the meat was sent at 6*d.* per lb. to a certain person whose name I presume I need not mention, and we had to receive the money on account of the sender. The price was 6 *d.* per lb., and we did receive the money, and I am told that it did not realise half the price. We received 6 *d.* per lb., and I am told on good authority that it did not make 3 *d.* per lb.

6522. Are you able to speak from your own personal knowledge of the condition in which the cargoes of dead meat which you have had consigned to you came over?—I am, for I am generally in the dead-meat market three times a week on an average, because we go there with a view of learning the real state of the trade, so that we may estimate the value of our live oxen.

6523. From your own observation, could you state whether that meat which was consigned to you at 6 *d.* per lb., and which you say realised not more than half, came over in bad condition?—I know it came over in exceedingly bad condition; that was the cause of its making so little.

6524. You say that it came over injured in condition from transit?—Yes; but I have seen a great deal of other meat which has not been consigned to me, and a great deal comes over in the winter in good condition, and it is a very great benefit to the poor. If I may be allowed to say so, I am a strong advocate for having all the meat you can, both dead and alive.

6525. You have stated that this dead meat comes over at a price of about 5 *d.* and a fraction per lb.?—This week it does.

6526. Therefore that would be in good condition, I presume?—No, not at all in good condition; but it fetched that price because our trade is good.

6527. Have those consignments of dead meat from America been steady consignments to you, showing that the people were remunerated by

Chairman—continued.

the price which they received?—Lately there has been a little falling off; but if it had continued, I should have had reason to know why it did continue, inasmuch as I know that arrangements were made with the boats to bring certain cargoes whether they answered or whether they did not.

6528. You mean that they have a contract for a given time, which obliges them to send meat over, even though the remuneration is not sufficient?—I know that that is the case in some instances.

6529. You are not able, of course, to speak as to the way in which the meat which was sent over had been prepared in America; whether it was prepared for the voyage in the way that has been described to this Committee, or whether it was an experiment made to test the efficacy of one particular process?—No, those were sent over by the regular boats, by the large steamers, with the usual cold chambers; I have the names of the boats.

6530. Were they sent over direct to London?—They were sent over in the ice cells. The last three lots have been sent to Southampton.

6531. And, therefore, they were subject, before they came on to the London market, to the ordinary atmospheric influence after having been taken out of the chamber?—Yes; but we had a singular case the day before yesterday. We had 580 quarters of this dead meat consigned to us, and Mr. Kilby, in the market, had 500 quarters consigned to him; he not wishing that his meat should clash with ours, or that ours should clash with his, arranged that his should come on in the cold chambers into the river here; we determined to land ours at Southampton. Ours was delayed one day, and the persons to whom we sent the meat considered that that one day's delay had deteriorated the meat, and made a difference in the price to the extent of from 6¾ *d.* to 7 *d.* per stone. That is the testimony of two of the men that I have seen this morning, unto whom we consigned the meat. It was landed upon the Tuesday night at Southampton, and it should have been in the market upon the Wednesday morning; but in consequence of having some 3,000 cheeses packed upon this meat, they could not get it out at Southampton in time to get it up into the London market on Wednesday, and, therefore, it suffered very much from that one day's delay.

6532. It was held over for the Thursday's market?—Yes; it was held over for the Thursday's market.

6533. That would represent two days outside the chamber in which it came over in the ship?—Nearly; but in the other case it was far worse, for I have seen Mr. Kilby this morning, and his meat that came over from Southampton in the cold chamber remains unsold now, and he says he shall not make 5 *d.* per pound of it.

6534. That was brought over in the cool chamber, as I understand. Was the reason of its not being sold the fact of its being depreciated in value, or the fact of its coming on the market at a time when there was too great a supply?—I should think the latter is one cause.

6535. It can hardly be put down entirely to the fact that the meat is depreciated, and therefore they cannot sell it?—That which came to us, and which was part of the same cargo, was in far better condition than that which I saw this

 morning,

Mr. *Giblett.*

22 June 1877.

Chairman—continued.

morning, which came up in the cool chambers round by the river.

6536. Are you able to speak at all as to the statement which has been made as to the consumers taking this meat freely; do they like it as well as other meat?—I believe that the majority, after having tried it, have a distaste for it altogether, and they find a distaste in it; that is my conclusion.

6537. But you do not speak from personal experience on that?—I tried it once.

6538. At the same time we have had evidence, and I suppose you are not prepared to dispute that evidence, that it is circulated largely in the trade in London, and that people make no complaints of it?—Its appearance is very much against it. It is not calculated to be sold among the poor, because it looks so much worse than it really is. The Army and Navy will not have it, as I heard the other day; and I know as a fact that the contractors are not allowed to send it to the poorhouses or to the prisons.

6539. The contractors have a regulation that they do not buy anything but live animals, have they not?—I beg your pardon, they have dead meat; but even at the places where they are allowed to send dead meat, they will not receive this American meat because it is so disfigured; it looks so bad.

6540. I understood a witness the other day to say to this Committee that the contractors generally did not buy dead meat, and that they absolutely refused to buy it; that is not your experience?—I know that in many cases they have exclusively dead meat, but in other cases their aim is to get their supply alive if they can. The Government contracts for Aldershot are taken now by my especial friends, Messrs. Hope and Harrington.

6541. If it is the case that there is not an absolute restriction with regard to their purchasing dead meat, and if, as you say, contractors do buy dead meat, I suppose, if the dead meat came over from America in the good condition that many of these cargoes are described to have come in, there would be nothing to prevent their buying meat in that market?—If it came in good condition, and the appearance of it was good, they might; but it is the fact that they do reject it. A contractor told me yesterday that he had sent some, and that he had had it returned.

6542. It might be that in that case the contractor had a prejudice against the dead meat, and preferred the live animal?—It would have been policy on his part to send it, because he could get it for so much less.

6543. Have you any facts in your possession which would lead you to think that this American supply will continue?—Yes, I do believe that it will continue to be sent in large quantities in cold weather, dead; but in the hot weather it cannot be sent without fearful loss.

6544. That is your opinion?—It is founded on fact, inasmuch as I have a letter here from the largest sender in America, which shows that the loss on the dead meat is 560 *l.*

6545. Is that from New York?—Yes.

6546. Is it from Mr. Eastman?—No; Mr. Samuels. He says that the price is rising so much that oxen are worth 3 *l.* a head more in America than they were a few months since.

6547. Does that letter state that the prices in New York have risen, or that the prices have risen in the districts where those cattle are purchased?—He says that his relative is now in Canada purchasing, and that the Canadian oxen have risen 3 *l.* per head.

6548. But he does not tell you that the American supply, which was spoken of the other day as coming from Chicago, has risen in price?—Yes, he is one of the largest buyers there.

6549. Will you be kind enough to read the letter?—Yes, if you will allow me to leave out a name; it is only the name of a person to whom he sent a quantity of meat, and who refused to take it. This is a copy of the letter; it is dated the 9th of June 1877, and it is as follows: "We enclose an account of 160 oxen and 568 quarters of beef shipped by steamer "Greece" on the 6th instant. We beg to acknowledge your kind favour," and so forth, "and we were much pleased to hear from you; we have not fully determined what steps to take in the matter" (the gentleman I referred to) "having refused to receive the consignments which were brought here for him." Then he goes on to say; "Cattle are selling here higher every day; to-day they are selling at least from 2 *l.* to 3 *l.* higher than our first shipment this season, and if your markets do not improve it will be impossible to continue our shipments without losing money." This letter is sent from Mr. Samuels to Messrs. Bell, of Glasgow, who are the persons who consign everything to me in London.

6550. Those consignments that you have spoken of are the consignments which Mr. Hamilton, the flesher, from Glasgow, I think, spoke of as being sent forward by Messrs. Bell to London?—Yes; they are all consigned to us. The letter goes on: "We have just received your cable of the result of the 'Carinthia' shipments, and they will barely bring cost. The same cattle could not be bought to-day for less than 3 *l.* a head more. Our Mr. Levi Samuels is now in Canada to buy cattle, but we are afraid that the sales in the 'Carinthia' will have a very discouraging effect upon him. With regard to our London shipments, we are fearful the expense will eat up the profit. The beef shipped in Canada has lost us 2,600 *l.*, and in regard to the cattle by the same steamer, we have not been informed as yet whether they arrived safe, although the cash is remitted for the same. We will endeavour to ship our cattle to London by way of Thames Haven hereafter, instead of Southampton, and our next London shipment will be made in the steamer 'Holland,' sailing from here on the 20th instant. Please keep us fully posted in regard to the state of your markets, and cable the arrival of every steamer and the condition of the shipments."

6551. That letter evidently refers, then, to the cargoes that have been consigned to you from Glasgow?—No; this refers to those that were sold in Glasgow, both the live and dead meat.

6552. But I understood you just now to say that you had from Mr. Bell dead meat that had been sent to him consigned to you in London?—Yes; large quantities.

6553. I understood you to say that it was not of that that you were speaking when you were describing the condition of the meat, but of some meat that you had had from Southampton?—Yes; that was what I was describing to you before, that which came into our hands. But this

Chairman—continued.

this is a letter to Mr. Bell speaking of sales which he, Mr. Bell, made in Glasgow.

6554. As you have stated that with regard to the condition of the cattle that arrived from Southampton, can you, as we have had some evidence about the consignments of dead meat from Mr. Bell to London, which, I suppose, from what you now state, were consignments to you, tell us whether these consignments arrived in good order or not?—The first for which we took the money, viz., 6 *d.* per pound, made 3 *d.* per pound; I never had any except through Mr. Bell this year.

6555. Does that letter refer to the quarters of meat that you spoke of as having been sold on the 20th?—No; this only refers to that which was sold by Mr. Bell in Glasgow.

6556. You state that to the Committee to show that you do not believe that this trade at its present price will be a continuous trade, but that the prices will go up?—I believe that in winter it will be a continuous trade, but not in summer, for dead meat.

6557. Notwithstanding what has been given in evidence before this Committee, that in the hottest weather in summer some of the best cargoes have been imported?—They must have been those that I have not seen.

6558. I suppose on that fact you would state to the Committee that you believe that it would not be wise to kill all the cattle from the Continent, to prohibit the import of live animals, and to set up a dead-meat trade with the Continent generally?—The very proposition appears to me so unreasonable that I am only astounded that anybody could ever have made it.

6559. The proposition, of course, is founded on the idea that, for the purpose of eradicating cattle disease in this country, you would be justified in taking all precautions to prevent its introduction, and that one of the greatest precautions would be the stoppage of the live-meat trade from countries where you cannot have the same power as you have in your own country of establishing and enforcing regulations?—The idea must be purely theoretical, because it could not have been founded upon practice. In fact from some countries it would be monstrous to suppose that it is capable of being sent, as for instance, from Spain and Oporto, and from Oporto more particularly. Such oxen as I have described, which I sell sometimes 50, 60, or 80 in a cargo at 29 *l.* each, are fed in a very rich manner upon a particularly rich kind of food; they are chiefly fed upon Indian corn or maize; they are fed at certain times of the year upon the leaves that grow like lily leaves, which are very rich; there is a great deal of saccharine juice in them. It would be absolutely impossible for that meat to be killed in a hot country like Spain and sent here without fearful loss.

6560. You believe that a dead-meat trade with Spain would be impossible from the difficulty of establishing slaughter-houses and places in that country?—No; I believe it would annihilate trade, not from the difficulty of establishing slaughter-houses, because they could create any number of slaughter-houses, but from the impracticability of killing that rich meat there and sending it over here dead.

6561. You think that the system which is adopted in America, by which, on slaughtering the animal, he is at once subjected to a cooling process which drives all the animal heat out of him, and puts him in what they state to be a condition to bear travelling, could not be applied to the cattle in Spain and Portugal?—No. In extremely cold weather there might be an exception, but in any weather that was not extremely cold it would not be practicable, because the very process which they pursue of dipping these oxen into tanks immediately after they are killed must, it seems to me, be very deleterious to the meat.

Chairman—continued.

6562. That is not the question I wish to refer to. The process which has been described here is that on the slaughtering of the animal, the quarters of the carcase were at once subjected to a cooling process in a chamber, prepared very much in the same way as the refrigerating chamber in which the meat is carried over, in which the temperature was gradually reduced until the animal heat was driven out of the carcase, and that, when so prepared and so chilled through, the quarters were placed in the refrigerator which brought them to this country, there being no dipping at all carried out in that system. If that is possible in America, with a temperature of 104 degrees in the shade, as was described, would it not be possible to carry out something of the same kind with regard to the trade of which you are speaking?—They have had such serious losses in sending meat from that country with all their experience, that I do not think it would be wise to suppose it practicable to adopt the process in countries where the heat is greater and the beasts richer.

6563. You think that the losses that would be sustained would stop the trade, and that we should lose that supply?—I firmly believe it.

6564. And that supply is one which comes from a country from which we import very little disease, if any?—They are the soundest beasts I know, and the finest formed beasts of any in the world.

6565. The animal is a very valuable one, as competing with the animal of this country?—Some of them are as square as oblong boxes.

6566. If your opinion is that we ought not to put a stop to the import of live animals, would you think that it would be necessary to increase our existing restrictions so as to prevent the import of disease from foreign countries, or how would you propose to deal with the question yourself?—As a member of the Smithfield Club for 48 years, I do not think that there is one gentleman in the country who is more anxious than I should be to see every precaution taken to guard against the possibility of cattle plague coming to this country.

6567. Do you refer both to cattle plague and to other complaints, or simply to cattle plague?—I am speaking particularly with regard to cattle plague. As for the other ailments, I know that they have been worse in England before any foreign ox was ever imported.

6568. With regard to cattle plague, you would think it wise to establish such restrictions as might tend to give us permanent security against its importation from abroad?—From countries where cattle plague existed, or had existed for any length of time, I would not allow any ox or any meat to come.

6569. With regard to countries as to which no such fear of cattle plague existed, I suppose you would propose that they should export cattle freely into the country?—It is most essential to

Mr. *Giblett.*

22 June 1877.

Chairman—continued.

feed the poor, for there cannot be a greater blessing to the community than having cheap meat. We cannot compete with foreigners until our people are fed cheaply.

6570. That is with regard to cattle plague; but with regard to pleuro-pneumonia and foot-and-mouth disease, do you think that restrictions as to slaughter at the port of cattle from countries where those diseases were proved to exist would be justifiable?—There is hardly any country where foot-and-mouth disease does not exist, and I do not wonder at it, inasmuch as it is generally believed to be purely atmospherical.

6571. I suppose you do not attribute pleuro-pneumonia to the atmosphere?—Yes, I attribute much of the lung complaint to the change of atmosphere, especially in young animals from Ireland.

6572. Do you think that pleuro-pneumonia is not contagious?—I cannot undertake to give an opinion about that.

6573. However, that the existence in a foreign country of pleuro-pneumonia being a disease which is treated as a fatal disease in this country, and which is very injurious when it breaks out, would not in your opinion justify us in slaughtering at the port of debarkation, animals coming from that country?—It exists in almost every country; it exists in Ireland particularly, and in many parts of England, and in the cowsheds of London.

6574. Pleuro-pneumonia, I believe, does not exist in Spain or Portugal?—No, it is never known there.

6575. It is said not to exist in Denmark; and you would make no distinction as between countries, where a disease of that sort, which is very fatal when introduced does not exist, and countries where it is known to exist to a great extent, from which you might by allowing free import into this country be certain of getting increased centres of pleuro-pneumonia?—If you are speaking of the lung complaint exclusively, it is very difficult to draw a hard line against any country because pleuro-pneumonia may exist there, because it exists in all counties that I am conversant with at home.

6576. Whilst we continue to have pleuro-pneumonia generally spread throughout the country, you think that it should not form a reason for a line being drawn against the import from countries where it exists abroad?—No. As to the foot-and-mouth complaint, if I may be allowed to make the observation, my experience proves to me (and I speak of what I know) that it was worse in this country and more general long before an ox was imported into England, than it has ever been since. That I know.

6577. Was that before 1842?—Yes; three or four years before; it was very bad indeed.

6578. You would say that that is not a disease to prevent the introduction of which we should be justified in stopping the import of cattle from abroad?—No; nor according to my view are we justified in continuing the present laws as they are.

6579. You would relax even the present laws with regard to foot-and-mouth disease?—Certainly; and I would certainly make them uniform. I would have them emanate from a central head, the Privy Council, instead of giving liberty to any local authority to be partial in their own case or not.

Chairman—continued.

6580. You agree with other witnesses that the power of issuing regulations and restrictions for all these diseases should centre in the Privy Council, and that the local powers should, for these purposes, be done away with, so as to bring about uniformity?—Yes.

6581. I suppose, from what you have said, that in almost every case you would either prohibit importation from countries where cattle plague existed, or from which the introduction of cattle plague was possible (putting aside pleuro-pneumonia and foot-and-mouth disease), or you would allow the cattle, when sent over to this country, to go freely into the Islington Market, instead of being sent for slaughter to Deptford?—Certainly. It is very easy, I think, to show how they may go from that market through the country without doing any harm. I would not allow any to go out except for killing purposes.

6582. You agree with what Mr. Gebhardt, I think, stated on that subject?—I scarcely know his opinion, but it has long been mine.

6583. He recommended that the Islington Market should be made a slaughter market, and that animals which were once sent in there should only go from it under a license for slaughter, and not for exposure in other markets?—I am glad to hear that that is his opinion; that is my opinion, and I have held it for a long time. I would have every animal marked, the tail shaved, a broad arrow put in a conspicuous place upon the animals with scissors; and I would have a penalty of 3 *l.* for every ox coming from the Islington Market which was afterwards exhibited or exposed for sale in a country market.

6584. Practically that would limit it to taking the animal from Islington away anywhere for slaughter alone?—Yes, and what a boon that would be to many counties which do not create enough animal food for their own supply.

6585. And in that way, I suppose, you would say that you might relax the restrictions which oblige animals to go to Deptford for slaughter?—Certainly I would.

6586. In fact, you would do away with the Deptford Market altogether?—I hate a covered market. I have stood in an open market for 50 years, and I should not stand in the Deptford Market 10 years and keep my health.

6587. Is your dislike founded only on the fact that you have been accustomed to an open market, or on reasons which you could give the Committee against a covered market?—We have fresh air at the Islington Market instead of the awful smells that they have in Deptford, and I should ask to be permitted to express the hope that the Privy Council would send a sanitary inspector there just to see and feel what I have felt upon the subject. I have seen men going about six together, with their handkerchiefs up to their noses, because they could not bear to smell the fearful stench which arises there.

6588. I gather from your evidence that you think we are perfectly justified in this country in taking any precaution that may be necessary against the introduction of cattle plague?—Certainly.

6589. But, with regard to other diseases, from the fact of their prevailing extensively in this country, you do not think that we should be justified in making regulations as against the foreign import, and you believe that we could get over the necessity of slaughtering at the port by

Chairman—continued.

by making Islington Market a market for slaughter alone?—With proper provisions about their going out.

6590. With proper provisions to protect the public against their being taken into other markets?—Yes.

6591. Is there any other point which you wish to mention to the Committee?—From a report which I have seen of Mr. Sheldon's evidence, it appears that he had an idea that an ox in America could be bought for 16 *l.*

6592. I presume that what you wish to give is your personal experience, which you think differs from the evidence that is before the Committee?—Yes; this is a letter from Mr. Samuels, in which he speaks of a beast of the same weight which Mr. Sheldon spoke of, and it costs him at least 23 *l.*

6593. Were those animals bought in the same market as Mr. Sheldon spoke of?—In Canada.

6594. Mr. Sheldon was speaking of the Chicago trade?—It made a difference of 7 *l.* per head.

6595. I understand from your previous evidence that the prices in the Canadian trade have generally risen?—Certainly.

Mr. *W. E. Forster.*

6596. How long have you been in the trade?—I think about 48 years.

6597. Can you recollect what the price of beef per pound was when you began the trade?—The lowest price that I can recollect was a general price of 4½ *d.* per pound; that is 3 *s.* per stone when alive.

6598. And the rise, taking 10 years by 10 years, has been pretty continuous, has it not?—It is three times as much now as I have known it.

6599. I do not mean allowing for temporary fluctuations, but, taking 10 years by 10 years, I suppose the rise has been pretty continuous?—Yes, except in 1851, at the time of the first Exhibition.

6600. With your great experience of the trade, I should like to know what you think the main cause of this rise has been. There are two interpretations of it. Some witnesses think that it has been owing to cattle plague and other diseases; and there are, I believe, persons who think that the chief causes are, first, the increase of population; and, secondly, the greater prosperity of the working classes. Which of those two causes do you think has produced the rise in the price of meat?—I have stated on the paper that I have given to the honourable Chairman that my belief of the causes was, first, the increase of the population; and, next, the restrictions connected with the foot-and-mouth complaint.

6601. Do you not think that not only the increase of population, but also the better position of the working classes, has had a good deal to do with it?—Certainly. When I said the increase of the population I also meant the increase of the work that they have. In Scotland the working population hardly used to eat any meat compared with what they do now.

6602. You must have watched the trade pretty narrowly; do you think that, taking one year with another, not taking any particular moment of depression, the poorer part of the population of London consume much more meat than they did?—I think that a great many of the poor cannot get any.

Mr. *W. E. Forster*—continued.

6603. That was always the case, I suppose?—It is more the case now, inasmuch as it is now so dear, and then it was cheap.

6604. But do you think that upon the whole the consumption in London has or has not increased more than would be accounted for by the mere increase of population?—Yes, the habit of eating meat, especially amongst strong working men, has increased.

6605. With this increase of price, two or three new supplies have been developed; I suppose the supply of live cattle from Germany has all come in since your early experience?—Yes, I think I had the first.

6606. And from Holland?—Yes.

6607. And from Denmark?—Yes.

6608. And from Spain and Portugal?—Yes, I had the first from Spain and Portugal.

6609. I need scarcely ask you whether the dead-meat supply is not quite recent either from the Continent and from America?—For 10 or 15 or 20 years they have sent dead meat.

6610. But not in large quantities?—They sent mutton first; and then a great deal of beef has been sent from Aberdeen.

6611. But I am talking of America; the importation of dead meat from America in any quantities is a recent affair, is it not?—Entirely so.

6612. Having these facts before us, that the price has largely risen, and that new supplies have developed themselves, what do you think would be the effect upon the price if we stopped one of the supplies by prohibiting the importation of all live cattle from the Continent?—It would make it fabulously dear.

6613. Then you have no belief that the rise in the price would induce the continental exporters to try the experiment of sending dead meat, and so to bring the price down again?—No, I rather believe that the reduction of the price would cause them, instead of rearing cattle for our market, to turn their land to other purposes, or to send their cattle to other countries.

6614. You are aware that several of the witnesses who are interested in the trade, think that the advantages to the consumer of this import of continental cattle are much more than counterbalanced by the import of disease and the consequent diminution of the home cattle; you do not agree with that opinion?—No; neither do I believe the statistics which I have read about the number of cattle.

6615. I understand you to say that you do not believe that the stoppage of the import of live cattle from the Continent would have any perceptible effect upon either pleuro-pneumonia or foot-and-mouth disease in England?—It would certainly not have any material effect as regards the foot-and-mouth complaint; and from some countries it would not augment the lung complaint at all, because they are sound; from other countries, where they are not quite sound, it may have the same effect as their passing from one county of England to another.

6616. Do you sell home cattle?—Yes, I have sold some of the finest Scotch cattle, Mr. McCombie's, and others.

6617. I suppose you do almost as large a business in home cattle as you do in foreign cattle?—All my business was in home cattle at one time.

Mr. *Giblett.*

22 June 1877.

Mr *W. E. Forster*—continued.

6618. At this time do you do a large trade in home cattle?—It is not now nearly so large in home cattle as it was.

6619. But you have had, and still have, sufficient experience of home cattle to be able to compare them with the peninsula cattle?—Yes, certainly.

6620. Would it not appear to you almost an absurd opinion to suppose that there was more disease with the peninsula cattle than with the home cattle?—I feel perfectly sure that there is very much less. I know all about the diseases which have taken place in the home cattle; I know it in Scotland, and I know it in Ireland, and I know it in every county in England.

6621. Then the prohibition of the import of Spanish cattle, in order to stop disease in England, would seem to you absurd?—Childish.

6622. Would you not apply that same remark to Denmark?—Denmark is perfectly sound. It would seem suicidal to our own interests to stop the supply of good meat.

6623. You made a remark that you thought that the present restrictions (I do not mean the restrictions merely in consequence of this little outbreak of cattle plague, but the restrictions which existed six months ago) had a very bad effect upon the trade; what do you exactly mean by that?—I was alluding particularly to the foot-and-mouth disease. I have known many cargoes stopped when they were perfectly sound.

6624. Then you think that the restriction which obliges the whole of the cargo to be slaughtered because one or two of the animals are ill, has a material effect upon the import?—Yes; as to France, I know it has a very material effect upon the quantity that is sent.

6625. And you compare that, in your own mind, with the fact that if a large drove came into the Islington Market from any part of England, and half the animals were affected with foot-and-mouth disease, all the rest would be sold without any restriction whatever?—It has been the case for the last year or two, that whatever number were affected with the foot-and-mouth complaint, all the rest went everywhere else throughout the country

6626. Then it is the fact that, whether it ought to be so or not, the restrictions against the spread of disease are very much heavier upon the foreign cattle than they are at this moment upon the home cattle?—According to my view of the case, they are very unjust. In Ireland they are favoured, and we are not.

6627. You, I suppose, have received consignments at the Deptford Market ever since the Deptford Market was established?—Yes; I have had large consignments from France.

6628. And German cattle also?—Yes; but not so many.

6629. Has not the uncertainty as to whether the cattle should or should not be sold at Deptford been a great inconvenience in the trade?—Wonderfully so. Some days at Deptford I have had a good trade, and afterwards we have not been able to realise nearly the market price.

6630. It is not that uncertainty to which I am alluding; has there not been an uncertainty in the mind of the exporter as to whether or not it would be necessary for his cattle to be sold at Deptford, or whether he would be allowed to go to Islington?—Yes; he does not know whether he can find them there till close upon the time he wants them.

Mr. *W. E. Forster*—continued.

6631. My reason for asking that question is this; do you not think that, if all the cattle from the Continent, or, at any rate, from Germany and from France, were ordered under all circumstances to go to Deptford, there would be against the immediate disadvantage the advantage that the exporter would know which market his cattle were to go to, and that consequently arrangements would be made for the conduct of the trade with more certainty than is possible at present?—But that would be a mere nothing compared with the immense disadvantage of obliging them to go to what I term and what I feel to be a condemned cell; you will excuse strong language, if you please, inasmuch as I have been there so often and know the evils of the place.

6632. From your practical experience, will you tell the Committee why it is such a loss to the consignor to send to Deptford rather than to Islington?—In the first place there are no retail butchers there; and the retail butchers are like the swordfish to the leviathan of the deep; the retail buyers urge on the wholesale buyers to progress in the same way as the swordfish compels the whale to move on.

6633. Would not the retail buyers be likely to come there if they knew that there would always be a considerable amount of cattle imported into Deptford, whereas at present they do not know whether the cargoes may not come after all to Islington?—Certainly not; a great many of them hate the place, and they will not go at all. I offered one gentleman, Mr. Cockrill, to send a carriage and pair if he would come; that was a man to whom I have sold 50,000 *l.* worth a year for many years past. No, he would not come if you offered him 20 carriages and pairs, and gave them to him into the bargain.

6634. The railway is not yet made to the market, is it?—No, it is about three quarters of a mile off.

6635. There is an immense population about the market, is there not?—Yes, but see how sallow and bad they look; you will see our Islington salesmen look very differently; though, I think, if they were to go to Deptford much they would have an Asiatic appearance.

6636. With regard to the sale of offal, is there as good a market for it at Deptford as in other parts of London?—No.

6637. Why?—They do not get so much; I have been often obliged to have a quantity of oxen killed because of the paucity of buyers; I could not get customers to go down there to buy them, and then there is devolved upon us the most disagreeable duty of selling this offal, and it makes a great deal less than it would in other places.

6638. Turning to the dead-meat trade, I understand you to say that at the present moment, at any rate, the exporter has to run a great risk in that trade as to something happening that would make his cargo unsaleable when he gets it here?—There is every reason to believe that in the summer time it would be a great loss.

6639. Comparing the dead-meat trade with the live-meat trade, would it not be fair to recollect that there is also some risk with regard to the live meat: for instance, is it not true that not unfrequently cargoes from the Continent have been

Mr. *W. E. Forster*—continued.

been so delayed by stress of weather that they have suffered very considerably?—Yes.

6640. Therefore there is risk in both, and you would have to charge a sort of insurance against the risk in each case?—But the risk of bringing cattle from Oporto is comparatively nominal, for we have had thousands and thousands brought over with scarcely any casualties at all.

6641. Do you object to telling the Committee what the freight from Oporto to England is?—They used to pay the proprietors of certain boats 2 *l.* per head; and now the importers have boats of their own, and therefore they can afford to bring them at a great deal less. Messrs. Hope and Harrington have the most splendid arrangements for their cattle; they are quite model sheds; they have an inspector over there, at a cost of 300 *l.* or 400 *l.* a year, to take care that all the cattle shall come sound; it is of vital importance to them, they serve the army with so many.

6642. What is generally the length of the voyage from Oporto?—About four days on an average, but sometimes it takes only three and a-half days.

6643. What is the freight of a beast from New York?—I will confine myself to what I know. I have documents here which give the money that I pay. I paid 7 *l.* 10 *s.* each for those which came from New York alive, and about 4 *l.* 10 *s.* for carcases of others.

6644. It sounds strange to me that, having to pay so much as that, there was the slightest chance of profit upon the animal?—I should think that all I have sold from America have made 30 *l.* each, and that is about one-fifth more than the average of English beasts would make; because a great many of the English beasts are sold long before they are fit to be sold; they are prematurely killed. It would be a benefit to the farmers, no doubt, if meat were cheaper. They cannot get stores.

6645. We have had evidence given here by an American gentleman, who is much interested in the dead-meat trade, in which he made this statement: that if the carcase was brought over under fair conditions, that is to say, under the conditions which he thought had been obtained by his process, and in which his cargoes had generally come over, the carcase that was taken out of the refrigerator on board the ship would, even in the hottest weather, last many days longer than the carcase of an English animal killed on the same day that the other was taken out of the refrigerator; what is your opinion with regard to that?—Mine is more than an opinion, because it is founded upon experience. I have proved here, by reference to two highly respectable men, that the American meat becomes deteriorated to the amount of three-farthings per pound by one day's delay.

6646. But do you not think that that could be avoided if the process were properly carried out?—It is one thing for them to talk about carrying it out well, and it is another thing for them to do it.

6647. Have you ever seen a cargo that has come over in which you think that the carcase would last in good condition in hot weather for two or three days after it was taken out of the refrigerator?—No, certainly not; in cold weather I have seen it come in good order.

6648. Have you ever had much consignment

Mr. *W. E. Forster*—continued.

of dead meat from Aberdeen?—Not consigned to me, but I know all about its coming in large quanties.

6649. Does that come in the summer?—Very little, indeed, comes in the summer; they have had very large losses when they have attempted to send it in the summer; some does come, but not in large proportions.

Mr. *Wilbraham Egerton.*

6650. Do you know anything about the importation of live cattle from America?—Yes.

6651. Do you think that that importation will increase, especially during the summer months?—Without a doubt it will, from what I hear and from what I see of the quality of the animals.

6652. Do you think it is possible that before long London will be better supplied by dead meat from America during the winter, and by live cattle during the summer, than it is at present from abroad?—I think it would be a very excellent auxiliary.

6653. Why do you say that it will be an auxiliary?—Because it will assist to increase the supply.

6654. But supposing that the Americans were able to send the quantity of meat and of live animals into our market, which they say they can send (and which no doubt they can if they wish to do so; that is to say, provided the price pays them), surely the foreigners will be beaten out of the market?—I do not see that, because I feel sure, especially from the evidence that I have heard, that the price of meat will rise as much there. Just now it is a very bad time; a vast number of the population in America are out of work; but if they had better times, with the competition of sending a large amount here dead and alive, the price must necessarily rise; and, indeed, it has risen, according to this return, 3 *l.* per head in two months.

6655. There is still a margin of profit even if it should rise still more, is there not?—I do not know.

6656. From evidence which we have had before this Committee, it would appear to be so?—I do not know the cost price.

6657. Will you tell us the margin of profit which the foreigner has?—It is very uncertain, indeed. He is speculative; he trades with a hope of getting a profit, and it must vary very much.

6658. What is the lowest remunerative price for cattle from the Continent?—There is no established profit for them.

6659. At what price would it no longer pay the foreigner to send his cattle here?—A great many of them cease to send. They try it on; it depends upon their ability in buying.

6660. Do you know anything about Dutch cattle?—Only from what I see, but I do not sell them.

6661. Does much dead meat come from Holland now?—I think not.

6662. Is there any reason why all the stock from Holland should not come in the shape of dead meat, seeing that it is only a 12 hours' passage?—It is far better that it should come alive, I should think.

6663. Is there any reason why it should not come dead, considering that it is only a 12 hours' passage?—I prefer its coming alive. I used to buy for my friends many hundreds of these

Mr. *Giblett*.

22 June 1877.

Mr. *Wilbraham Egerton*—continued.

Dutch oxen; they are very well adapted for Government contractors for the troops, because they do not want meat too fat.

6664. Have you ever bought Portuguese and Spanish animals for Government contractors?—Yes; I have bought them for other people. They send immense quantities to Aldershot every week; this week a large quantity is going there; there are 200 going to-morrow.

6665. Are they sent dead or alive?—Alive.

6666. I suppose there is no reason why Portuguese or Spanish animals should not continue to be imported alive, those being countries where they have no disease?—I think that it would be perfectly impracticable to attempt to send over in a dead state rich meat of that character, fed so richly as they are, neither is there any necessity for it.

6667. If the Portuguese or Spanish animals were allowed to come in alive, the Government contracts would be still as well supplied as ever?—They want competition; the Government have to give very high prices now.

6668. But the American live animals would afford competition, would they not?—No, they are rather thicker and more massive and better than the Government want. They do not want oxen at 30 *l.* each; they want comparatively lean oxen.

6669. Do the Government never buy home cattle for the supply of the troops?—Some contractors do and some do not.

6670. Therefore that supply would not be cut off?—A great deal of it is cut off naturally inasmuch as we eat them before they are ready. On an average, we do not feed the animals beyond two and a half years old, and a Government contractor can afford to give 20 guineas for animals that graziers ought to buy for feeding at 14 *l.*

6671. Is there not tendency at the present day to kill animals very much younger than they used to be killed?—Yes.

6672. That is good policy, is it not?—It is very bad policy so far as regards the supply of food for the people; because if you kill them at that young age there is no substance or weight in them and you have nothing left. You kill them before they are ready in six cases out of nine. A quantity of store cattle are killed which ought to be kept for the benefit of the graziers and to be made into large fine oxen; they are prematurely killed to supply the want of the country, and if the supply from abroad was cut off they would kill them so rapidly that you would not have half the supply left.

6673. Would not that rather tend to encourage the rearing of more animals in England?—Yes; it is astonishing to me that they do not do it, but the fact is that they do not.

6674. Is it not the fact that the farmer is discouraged from doing so by the introduction of diseases with foreign cattle?—One would imagine that he need not be discouraged because the price is still high. At the Chamber of Commerce (of which I have heard so much, but which I have seldom known to do anything practical), I have proposed that there should be a system of buying up the young calves, and keeping them for a year somehow, and distributing them by yearly sales at the end of the year; I thought that that was a very feasible idea, but it is not yet adopted, and half the country is not stocked. There is a district, for 20 miles round to London, where there is plenty of feed, and where there are hardly any cattle to be seen. England does not produce nearly what it might, and it does not seem to aim at doing so; and if it does not do so, let us have all the good cattle we can get from abroad.

Mr. *Wilbraham Egerton*—continued.

6675. You do not think that the American meat will at all interfere with the production of meat at home?—I think that the large quantity of American meat that has come dead has lowered the price of meat here, and has created a great deal of undue apprehension, according to my view of the case.

6676. Do you know what average price the farmer has got of late years for his animals which have been sold to the butcher?—Yes.

6677. Can you tell us what it has been, as compared with the price which the butcher has charged to the consumer, or with the wholesale price?—Taking the last year, the farmer has realised, on an average, 9 *d.* per pound for his oxen. The butcher may appear to have charged a very high price, but the truth is that everybody wants a sirloin of beef, and everybody wants a leg of mutton; nobody thinks of having shins and legs of beef: even the poor do not want to cook the same joints as our forefathers or mothers before us did. Then there is a horse and cart here and a horse and a cart there, and two miles to go for an order for a mutton chop.

6678. Has the American meat at all diminished the price obtained by the farmer?—Occasionally it has diminished it, but now it is a good price; it has been 9 *d.* per pound or 8¼ *d.* per pound on an average.

6679. With regard to foot-and-mouth disease, you say the home animals are unduly favoured in comparison with foreign animals; do you think that if the stoppage of fairs and markets was ordered at any time by the Government, in consequence of foot-and-mouth disease, that would be a fair equivalent to the restrictions which are now put upon foreign cattle?—According to my view of the case, I think you might just as well put up a five-barred gate to stop the wind. I believe it is an atmospherical influence; I believe it to be also infectious or contagious irrespective of that.

Mr. *Jacob Bright*.

6680. You have heard evidence given before this Committee, have you not, that it would be desirable in certain circumstances to shut out all live foreign cattle?—It appears very astonishing to me that such a proposition is made. I feel sure that it could not last long; it could not possibly answer.

6681. But could we not have the meat as dead meat?—From some countries, certainly, you could not, and, at certain times of the year, not from any country in good condition; they cannot send it from Aberdeen in this weather; they do not send it 100 miles in hot weather.

6682. How many months of the year are there in which it does not come from Aberdeen?—It is according to the weather.

6683. You spoke of the atmosphere conveying the disease; do you mean that the atmosphere carries the germs of the disease, or that there is an unhealthy atmosphere which engenders it?—I believe that it engenders it, and I believe that it is also easily carried on the wings of the atmosphere; there have been so many cases where the animals

Mr. *Jacob Bright*—continued.

animals have been perfectly isolated, and yet they have taken this foot-and-mouth complaint.

6684. You are speaking only of foot-and-mouth disease?—Exclusively.

6685. Not of the lung disease?—No; I understood your question to refer to the foot-and-mouth complaint.

Mr. *Dease.*

6686. Am I right in having understood you to say that you have realised as much as 30 *l.* profit on a live beast imported from America?—Certainly not; I have sold them at 30 *l.* per head.

6687. And from that you have deducted 7 *l.* 10 *s.*, which is the cost of bringing them over?—That would have to be deducted; all that I have sold will average 30 *l.* a-piece.

6688. What, then, was the first cost of one of those beasts?—I do not know; they do not let us know.

6689. Then you are not aware what the cost of that beast in America is?—No. I had one American ox that made 56 *l.* last week; I think that if it had been in the Agricultural Hall at Christmas time it would have made 80 *l.* They are our best bred shorthorn beasts, and they are developed in a way in which we do not develop them. Instead of their thighs shelving down, their buttocks are square. Why? Because they get all that extra flesh in the two years after you have done feeding them. It is a subject that I know something about.

6690. Does that arise simply from their greater age?—And from their better feeding. They are not fed upon artificial food, which limits and diminishes the flesh in some cases, but they are fed upon grasses, where the animals themselves grow, and their flesh grows; 40 out of the 90 that I sold yesterday are much squarer than the English beasts.

Mr. *Elliot.*

6691. You said, I think, that American meat landed at Southampton was estimated to have lost 6¾ *d.* per stone in one day's transit?—Yes, that is the evidence that I have from the person who sent it.

6692. Then would not the ordinary meat killed at Southampton, and exposed in hot weather such as we have had lately, deterioriate to something like a similar amount?—In quite hot weather it might. The losses have been fearful sometimes. I have had quantities killed at Southampton in consequence of one or two having the foot-and-mouth complaint, and therefore I know practically how much the loss is. I should say that the oxen which I have been obliged to have killed, have made quite 2 *l.* per head less by being killed at Southampton, instead of coming on to London in the usual way. That is in hot weather.

6693. That was not my question. If there were animals bred at Southampton and killed there, and it took them 24 hours to come up here, in hot weather would it not have the same effect upon them as it had upon this American meat?—No, not the same effect but partially the same. It would not affect it to the same extent, because if this meat comes in process of decomposition an extra day would squash it altogether; but in the case of the fresh beasts that you speak of as being killed at Southampton, it may not have such an injurious effect.

Mr. *Elliot*—continued.

6694. Did I correctly understand you to say that the difference in the price from the first time that you knew the trade, 48 years ago, and now, was, in your opinion, caused by the restrictions and by the increase of the general wealth of the country?—No. I should say that certainly the first cause of the increase of price would be the increase of population, and also the increase of labour that is found for the population.

6695. You do not think, then, that the loss from rinderpest and other diseases from 1842 to 1867, which was about 1,500,000 animals, has had any effect upon the price of meat?—I think that cattle plague had then, certainly.

6696. It has not had any effect, you think, since?—The effect continued, no doubt, because of the cattle having been slain.

6697. Will it not account for the price being depreciated even now, to some large extent, when you consider that there were 1,500,000 animals taken from the breeding stock of the country?—There has been quite time, with perseverance, to have recovered from that which happened eight years ago.

Mr. *King Harman.*

6698. You say that you know that foot-and-mouth disease existed before foreign cattle were imported; how do you know that?—I used to attend the market in Smithfield for several years, five or six years before any beasts were imported from abroad.

6699. That is to say, you began to attend that market about 1833 or 1834?—Yes, about 48 years ago. I have seen quantities of the hoofs of sheep taken up in bushel baskets which had all been thrown off in consequence of foot-and-mouth complaint.

Chairman.

6700. I think it has been quite established that it existed previously to foreign importation?—Yes; I should refer for proof to the evidence before the Committee of the House of Commons.

Mr. *King Harman.*

6701. You import cattle largely from France, I think?—I receive those that are imported.

6702. In 1876 the import from France was 4,445 cattle, and I see that of those 678 were landed with the foot-and-mouth disease; that is to say, more than one-sixth?—A great many came last year from France with the foot-and-mouth disease, or at least they had it before they left Deptford. A great many of them had not it when they got to Deptford, but they very soon took it. The fact is, as I have already mentioned to this Committee, that I have the greatest dislike to covered markets. I dislike the Paris Market exceedingly; any covered market is calculated to do a great deal of harm, and Deptford particularly so; that is my conviction.

6703. More than one-sixth of the French cattle landed last year being reported as having landed with foot-and-mouth disease, you think that they picked it up at the Deptford Market? I know that some would do so. I do not think that proportion came with it; I know that every bullock was marked, and sometimes they do not mark them until some time afterwards, and the place is so impregnated with ailments at Dept-

Mr. *Giblett.*

22 June 1877.

Mr *King-Harman*—continued.

ford that no animal could remain there unsold for three or four days without being much deteriorated. They will not eat after they have been subjected to this disinfecting process.

6704. Are they not examined before they arrive at the Deptford Market?—No, they are not examined until after they arrive.

6705. But they are examined immediately on their arrival, are they not?—No, not immediately; we often have to wait until the next day.

6706. But, of course, this return of the 678 animals affected with foot-and-mouth disease is founded on the report of the inspectors?—I saw a great many that had the foot-and-mouth disease, but they came chiefly from Paris. In Normandy, where the cattle are much finer, they have very little or hardly any foot-and-mouth disease, and I sold large quantities of beautiful beasts from Normandy at 40 *l.* a-piece and upwards last year and for many years; but those beasts that had the foot-and-mouth disease had been travelling about from below the Paris Market.

6707. And consequently they would probably endanger any cattle that might be travelling on the same road, in fact they would be spreading food-and-mouth disease through France?—The same as they would in England going from one county to the other.

Mr. *French.*

6708. What is the general age of the American live stock that come over?—I should say that those that are sent over are generally of very good quality, and they are old beasts, say quite five years of age.

6709. Do you think that it would pay farmers in this country to keep their cattle for such a long time as that?—No.

6710. Do you not think that the cattle that are killed at three years or three and a half years old are sufficiently old to make good beasts?—They certainly make good beasts at three years old, but where they are unduly forced at an earlier age they do lose, I think, both in quantity and in quality.

6711. They do not weigh so heavy as the older beasts?—No, but it is the extraordinarily good grasses that they have in America that make good cattle. Artificial food very often makes beasts fat, but it does not necessarily make them of good quality; it is on the grasses where the flesh is increased.

6712. Do you know anything about the markets in New York?—No, only by what I read in letters.

Mr. *Cameron of Lochiel.*

6713. Do you consider that feeding cattle on oil cake or on Indian corn makes the best beef?—I believe that nothing makes such good meat as the best grasses, but oil cake I should prefer to Indian corn; Indian corn would make the meat harder, I think.

6714. We have had evidence that in America those excellent cattle that you refer to are fed during the last two winters of their feeding on Indian corn?—It is so in winter, I believe; but in the fertile time of the year they have very excellent grass.

6715. You stated that you considered that the

Mr. *Cameron of Lochiel*—continued.

diminution of foreign importation would affect the price of meat, by raising it very considerably?—Very much so; fearfully so, no doubt.

6716. And so far it would affect the supply of meat, and the well-being of the poorer classes, more especially?—Certainly.

6717. Are you aware what proportion the foreign beasts imported alive into this country bear to the home-grown beasts?—I do not know. I have seen some statistics upon the subject. I am more conversant with the quantity which comes to London; I should not have had faith in statistics until I had traced their origin, and the way in which they are formed.

6718. Supposing that you were made aware that the total supply of foreign beasts was very small, say five per cent., compared to the total number of home-grown beasts, would you still adhere to your opinion that it would ruinously affect the interests of the country to stop that supply?—If I heard it so stated I should question its being the fact.

6719. Have you ever taken into consideration the loss to the country by the existence of disease in Great Britain?—I am aware that the cattle plague has caused a most fearful loss, and I have endeavoured to recommend all kinds of serious restrictions in that respect. As regards the foot-and-mouth complaint, I am aware that in the milking cows it must have caused considerable loss, and as regards oxen; but of all the 800,000 oxen that I have had to do with, I have never in my life known one die of the foot-and-mouth complaint.

6720. Do you think that the loss that has been incurred by this country in consequence of cattle disease is greater than the gain which you suppose would be derived by not stopping the importation of cattle?—In answering that question it requires to be separated, inasmuch as the amount of the loss in the case of cattle plague is easily estimated; but the foot-and-mouth complaint I hold to be an English native complaint, and therefore it would not be fair to attribute to that disease losses through disease generally; if we establish the fact that the foot-and-mouth complaint is neither more nor less than a native complaint.

Mr. *Anderson.*

6721. You have stated that in the time during which you have been in the trade there has been a great rise in the price of meat, and you have given a number of reasons for that rise; did it never occur to you that perhaps the depreciation in the value of money had a great deal to do with the apparent rise in the price of meat?—Yes, everything is dearer in proportion; I was going to name that; money is cheaper now in fact.

Colonel *Kingscote.*

6722. I think you yourself do not farm at all?—No.

6723. Have you ever studied veterinary science?—No, but I take the liberty of thinking that I know more about the foot-and-mouth complaint than half the young veterinaries that practice, and I knew all about it before they were born.

6724. I was going to ask you whether your experience of foot-and-mouth disease is derived entirely from your practical experience with fat cattle?—There are a great many come through our

Colonel *Kingscote*—continued.

our hands that are not fat, but my experience is confined to those that come through our hands.

6725. I think you more than once used the word "sound;" you said the cattle from Spain were more sound than our English cattle, and that therefore they realised higher prices; by that word "sound" did you mean that they were perfectly free from foot-and-mouth disease?—No. I know, to our cost, that in consequence of having two or three animals affected in a cargo of 250, we have had to have the whole of them killed and sent up to London in broiling hot weather at a loss of 2 *l.* 10 *s.* per head. That is what I complain of so much.

6726. But you do think that foot-and-mouth disease causes great loss, because, as I understood you, you laughed at foot-and-mouth disease, and you would have no restrictions against foot-and-mouth disease anywhere?—I would have restrictions, but no severe restrictions like that. In Glasgow every week they have the foot-and-mouth complaint; in most counties in England they have foot-and-mouth complaint; and in most markets in England they have the foot-and-mouth complaint, and all the beasts are allowed to go anywhere; but if you put your finger on one foreign animal which is affected out of 300, the whole of the others have to be killed at an immense loss.

6727. But I want to know whether you think that foot-and-mouth disease, whether in France or in Spain, or wherever it is, is not a cause of deterioration to the animal itself?—It is a passing evil; it is a deterioration but not of a malignant character. I have known more money gained by buying beasts with foot-and-mouth disease for grazing (I have bought them myself for other people), than by other beasts that have been bought sound.

6728. Because you have bought diseased cattle upon the chance of their getting better?—Yes; and I bought them for those who wished to try the experiment with them, and they paid immensely. Our chairman, Mr. Leeds, at the Agricultural Hall, whom I have the honour of having something to do with, says, that of all the cattle in the world, those that paid him most were some that he bought with the foot-and-mouth complaint.

6729. I do not quite understand the dealings between you and Messrs. Bell of Glasgow in the American cattle. I suppose I am not asking you more than I ought to ask you, but I conclude that you get a commission for all the live animals that you buy?—Yes, we pay ourselves on those we sell.

6730. Are there two commission agents in the matter, or do they come straight to you?—It appears so. Mr. Samuels and other persons in America consign them to Mr. Bell; his business does not admit of his coming to London, and everything he has he consigns to us.

6731. Then in reality, before the meat gets to the consumer, he has to pay a good deal in profit, not only to the producer, but to the gentlemen to whom it is consigned?—That is often the case; in most counties of England there are persons jobbing about; it goes through half-a-dozen hands.

6732. That tends to work up the price of meat, does it not?—No doubt the middlemen do; even salesmen are a necessary evil.

6733. You complain of the dead meat at Deptford not being able to find a vent; but surely, if the meat is slaughtered at Deptford, or anywhere else, you could bring it away in carts, and distribute it about the metropolis?—The trade is so fluctuating there; sometimes we have no custom at all; last year I had to sell a quantity of French beasts there, which, according to my belief, realised 4 *l.* a head less than they would have made in the London market; the consequence is that they do not continue to send them.

6734. Do you not think that it is much better in every way, in a sanitary point of view, to have the slaughter-houses in one place, like Deptford, than to have a number of little slaughter-houses all over the town?—I wish I might with good grace ask some of you gentlemen to go to Deptford and see it; you would never go twice if you could avoid it.

6735. If you took the roof off Deptford Market, would not that get over the difficulty?—I think that that would be a great improvement; we should get fresh air then, such as it is, in that locality.

6736. Would you not, from a sanitary point of view, advocate having slaughter-houses like there are at Deptford, or at any other place, and doing away with the number of small slaughter-houses in any town?—It is becoming more the practice for the meat to be supplied by the wholesale butchers; they buy large quantities alive, and then at the west end of the town seven out of ten do not come to the London market at all, but buy in meat markets the parts they want.

6737. Taking it altogether, with this American dead-meat trade, increasing so largely, everything tends to a dead-meat trade to the butchers, and hence to the consumers?—Even when beasts come alive from any country it tends to a dead-meat trade, inasmuch as the butchers come to the Metropolitan Central Dead Meat Market at Smithfield and buy it, and it goes off into the different avenues in their carts. The retail butchers buy it because, I presume, the wholesale butchers are more in the habit of buying it alive, and they dress it in an excellent manner.

6738. Supposing that a process were devised by which dead meat from America could always come over in good condition on board steamers, do you not think that it might supply the place of the foreign live-stock import?—It is a very great boon, and by all means get all the meat you can when the weather is cold; but do not depend upon the supply when the weather is hot, because then it cannot come except at an immense loss, and in a state that cannot be good for the senders, and I question whether it is good for the public.

Mr. *Arthur Peel.*

6739. When you said that the price of live cattle in America is now rising as much as 3 *l.* a head, were you speaking of the cattle killed for the dead-meat trade?—I think that this letter which I have read refers to the cattle generally. He would do as he liked about sending them alive or sending them dead. He is speaking of cattle generally rising in price.

6740. Do you think that the quality of the animals slaughtered for the dead-meat trade is equal to the quality of the animals that are sent over here alive?—I have seen them of wonderfully good quality dead; in fact I never saw meat cut better, only the worst of it is that it comes in such a disfigured state, and it looks so unsightly

Mr. *Giblett.*

22 June 1877.

Mr. *Giblett.*

22 June 1877.

Mr. *Arthur Peel*—continued.

unsightly in hot weather. Many persons come to the conclusion, practical men, whose opinion I would rather take than my own on such a subject, because I had rather not buy it exclusively, that it is like fish that has been on ice; it is softened and sodden.

6741. Some witnesses have stated that the dead meat which is sent from America is of an inferior quality; do you believe that?—No; in the cold weather I have had some oxen here weighing 200 stone, which is twice the weight of many of our English beasts. I have seen some quarters weighed, and the ox would weigh 200 stone.

6742. Do you think that it would pay to send as dead meat the valuable cattle of which you have been speaking?—In quite cold weather it has come in good order, but it would be ruinous to send it in such weather as this.

6743. You think that the dead-meat trade will be a winter trade?—Yes.

6744. And that the live importation will be a summer trade?—Yes, until the price gets dearer; but to be dependent upon America for our supplies in England would sound to me most unnational.

6745. Would you state what effect the dead-meat trade has had upon the prices of live cattle in the London market of late?—It came in large quantities, and it very much depressed our trade; but we had so few from abroad besides, that by struggling it made fair prices. It has never gone very low.

6746. Of late weeks has the amount of dead meat increased or diminished?—It has diminished. The price of good English meat and Scotch meat has been very stationary for some time, from 8½*d.* to 9*d.* per lb.; but then the offals are worth so much less money from the English beasts.

6747. How is it that you account for this continued importation of dead meat in the face of these repeated assertions that it is a dead loss?—That is a very natural inquiry; I understand that they have made certain contracts with certain vessels which are fitted up for the purpose of bringing this meat, and, having made those contracts, they continue to bring it irrespective of its being a gain or a loss.

6748. You say that offal is a very necessary article of food for the poor, and that one of the great drawbacks of the dead-meat trade is that we do not get offal?—That is most important; I should have been sorry to omit that, because I consider that the offal is a great blessing to the poor of England.

6749. Have you ever heard of offal coming from America?—I know of offal coming from very much nearer places when it has been in a disgusting state; the sheep's heads and the plucks.

6750. I was asking you about the American trade; do you know of any instance of offal coming from America in a fit state for food?—No; but the offal in a clean state is an immense item of food for the poor; it is not very sightly even then.

6751. You say that you suffered great loss at Deptford from not being able to dispose of the offal; is not the means of transit to Deptford a very simple one?—It was only a depreciation of the value of the offal; I could dispose of it.

Mr. *Chaplin.*

6752. You told the right honourable gentleman, the Member for Bradford, I think, that to prohibit all import of live cattle would ruinously affect the price of meat?—I think so; it would make it ruinously dear.

6753. Would it injuriously affect the profits of your business?—I do not think it would; I think I should turn what little intelligence I have to other branches of business; the dead meat that I receive pays me better than the live meat with the charges that I have made upon it; but I was not going to be troubled with it unless I was well paid.

6754. If the live import was stopped altogether, would that affect the profits of your business?—Yes, it would, certainly; but I do not come here to advocate my own business; I come here as the representative of the importers; in fact, if it had been with the view of advocating my own interest, I would not have asked to come; I come here at the request of Messrs. Hope and Harrington who send me from 5,000 to 10,000 oxen a year, and trust me implicitly with all their stock.

Chairman.

6755. Messrs. Hope and Harrington, I think, are Government contractors?—They are; there were never more beautiful places in the world for lairing cattle than they have.

Mr. *Chaplin.*

6756. You do not believe that the importation of American meat could be carried on successfully in the very hottest weather?—No, I see it all, and I know therefore how it comes, and I know that when it costs 6 *d.* per lb. in America it makes 3 *d.* per lb. here in some cases.

6757. But when it is delivered here in perfect order it makes considerably more than 3 *d.* per pound?—I never saw it in perfect order in hot weather.

6758. But we have had evidence from two or three witnesses, I think, that one cargo of American dead meat was delivered in this country in August last year, in the very hottest weather and in the most perfect condition; you are not aware of that?—No, it did not under my notice. I have seen all that has come this year.

6759. Does the evidence that I speak of tend to shake your opinion at all?—No, I would rather go by what I have seen.

6760. It would not lead you at all to believe that what we were told on Wednesday by Mr. Burkett, was the case, that is to say, that when the cargoes varied it was owing to want of care in the process of preparation on the other side, or to want of attention during the transit, or to some accident to the machinery, and to no other cause?—I heard it, and I questioned it at the time I heard it, because I knew that his experience was very limited.

6761. It does not shake your opinion at all?—Not in the least.

Chairman.

6762. I think you said, in answer to a question which was put to you by an honourable Member, that you were able to speak with regard to the proportions in the London trade, but not with regard to the proportions of the foreign import to the supply of the whole country?—No.

6763. Then, I suppose, what you would represent

Mr. *Giblett.*

22 June 1877.

Chairman—continued.

sent to the Committee is that whatever may be the proportion of foreign to English beasts with regard to the general trade of the country, the proportion of the foreign beasts as regards the London supply is very considerable?—It is a majority. A great deal goes to Hull and Edinburgh.

6764. But, as compared to the whole supply to the country, the foreign supply to London is a very large per-centage?—Quite half and more in the case of sheep.

6765. It appears by the figures in the Government reports that, in 1876, 46 per cent. of the total cattle sold in London were foreign animals; therefore the stoppage of this foreign import, in your opinion, would seriously affect the trade in London?—Yes, not merely the population of London, but of the country; for in Brighton they have hardly any meat produced, and in Kent they do not create one-sixth part of what they want.

6766. That brings me to one of the answers which you made to an honourable Member, which was, that England did not produce nearly the amount of stock that it might produce; do you speak of that from your own personal knowledge?—Yes. I am astonished to see the paucity of stock that there is in many counties.

6767. A question has been raised before this Committee as to whether the stock of the country could be very largely increased if the farmers turned their attention to it; many witnesses have stated to the Committee that the grazing power of the country was already fully occupied; that is not your opinion?—No, quite the contrary. An immense number of calves are killed when they are only one month old, or when they are a week old sometimes, and it is a shame whilst they are destitute of stock in the country, that calves should be sacrificed in the way they are.

Chairman—continued.

6768. You stated to the Committee, I think, that, if the farmers turned their attention to it, we might very largely increase the home stock?—Yes; but if you did not get a large supply from abroad, you would be half-starved while you were doing it.

6769. But you admit that the stock in the country is capable of increase to a very great extent?—Yes, and I think the consumption is capable of being doubled; but at the present price poor people cannot get any meat to eat; they must live upon fish, and offal, and refuse.

6770. That is the present price of the home meat, but you are not alluding, I suppose, to the price which the American dead meat has realised?—That is a great boon to them, as they are not able to get any better. I wish, if possible, whilst we are obliged to go to Deptford, that we might not have the market on the same day as at Islington.

6771. You would represent that it is a great inconvenience to the trade that the markets happen on the same day?—A great inconvenience. How can you expect independent men with a great deal of money in their pockets to get there at four or five o'clock in the morning and attend two markets in one day.

6772. Do you believe that if the markets were held on different days, it would produce a larger competition in the Deptford Market?—I believe it would, and much larger in the English market. That is what I felt so much; that the English graziers would go to the wall by the Deptford Market being established, because very often some of our most important men do not come to the English market at all, but prefer to go where they can buy a cheaper meat.

6773. And you think that they are held off the market by the fact of the markets taking place on one day?—Yes, many of them will not go to two markets in one day.

Mr. WILLIAM STRATTON, called in; and Examined.

Mr. *Stratton.*

Chairman.

6774. I BELIEVE you live in Wiltshire?—Yes.

6775. And you are very much interested in the question which is now under the consideration of this Committee?—I am.

6776. Can you speak as to the effect of foot-and-mouth disease, and as to that disease discouraging the keeping of stock in your neighbourhood?—I can. Our county suffers very seriously from foot-and-mouth disease; it is the contagious disease which inflicts the greatest injury upon the stock of our county. I have been a member of the Executive Committee for dealing with contagious diseases in the county of Wilts ever since its first formation, and I have therefore been able to watch the effects of the regulations, and I have had my attention very closely called to them. I have always felt that in making representations to the Government we had not statistical data to lay before the authorities; so that last year I requested the chief-constable, who is the principal officer acting under the Executive Committee, to compile returns as to the number of cattle that had been officially reported to him as affected with foot-and-mouth disease during the last four years in our county. Those returns he has sent to me, and I have them now before me. They are incomplete for two years in consequence of the returns of foot-and-mouth disease not having been made to the Clerk of the Peace for two half years between the 21st of June 1873 and the 10th of June 1874. The regulations as to the returns of foot-and-mouth disease were repealed on the 21st of June 1873, so that no returns were made from that time until the 10th of June 1874, when they were again required; so that the returns that I have beginning on the 1st of January 1872, and extending to the end of December 1875, are only complete for the two years, 1872 and 1875. There are returns for every week of every year separately for each petty sessional division. They show that in the year 1872 there were 37,444 beasts returned as having been infected with foot-and-mouth disease in our county; there were 6,545 pigs so returned, and 113,805 sheep. From the returns issued from the Board of Trade, the total number of head of cattle in our county in June 1871 was 79,350; of pigs 65,000; and of sheep 722,000; so that nearly one-half of our cattle were affected with foot-and-mouth disease in the year 1872, and more than one-sixth of our sheep. The returns are incomplete for 1873 and 1874, and therefore

Chairman—continued.

Mr. *Stratton.*

22 June 1877.

Chairman—continued.

I will not quote them; but for 1875 they were again complete. We then had officially returned 24,000 head of cattle, and 5,000 pigs, and 64,000 sheep as having been affected.

6777. Had the stock in the meantime varied at all, or was the Board of Trade return for 1872 applicable to 1875?—The Board of Trade returns have shown a gradual diminution of the number of stock in the country generally; I cannot speak positively as to our own county, but I believe that it would be true as to our county.

6778. You quote those figures as showing how serious has been the effect of foot-and-mouth disease in the county in which you live?—Quite so; our county is largely a dairy district, and the losses there are very frightful.

6779. I suppose by the losses you mean the deterioration of stock, and the losses from the dropping of calves?—The absolute losses by deaths are very much less serious in their effects than the depreciation in the value of the live animals.

6780. I understand that in cases of foot-and-mouth disease the deaths are not very frequent; I suppose you would confirm that?—From foot-and-mouth disease we absolutely lost in 1872, 439 beasts, 851 pigs, and 55 sheep.

6781. Were those lost beasts any of them cows, the dairies being most seriously affected?—They were most seriously affected.

6782. Besides those actual direct losses, I suppose that the depreciation of stock was very considerable?—We could not adopt a closer valuation than 2 *l.* per head on all the animals affected.

6783. Whilst at the same time, from your having to re-prepare your fat stock where they were affected with it, you lost the possibility of feeding off other animals on the farm, which was also a direct loss to the consumer?—Quite so.

6784. With regard to pleuro-pneumonia, what effect has that had upon your cattle?—Pleuro-pnemuonia is a very much less serious disease in our county than the other, and I believe it is so over the whole of England. The returns of pleuro-pneumonia are complete for the four years, and the total number of animals affected in our county during the four years has been only 69; of that number 46 have been slaughtered, and 20 have died; so that the deaths from foot-and-mouth disease have been nearly ten times as numerous in the year 1872, as from pleuro-pneumonia in the years 1872 to 1875 inclusive.

6785. Is there any record of what happened in the other three cases?—There is no record in the official returns as to that.

6786. That would prove that the disease of pleuro-pneumonia has not affected your district so largely by any means as the other disease?—Yes.

6787. What restrictions have you adopted with regard to those diseases during those two years that you have spoken of?—We, in our county, have exercised to their full extent the powers that have been conferred upon us; we have applied the pleuro-pneumonia rules, so far as the law allows, in cases of foot-and-mouth disease; but we complain that the powers do not extend far enough.

6788. What regulations would you suggest as being necessary in order to cope with these diseases?—I am a member of the Central Chamber of Agriculture, and I have represented the southern division of the county of Wilts at that Chamber for the last five years. We have there drawn up a series of recommendations which we have submitted to the Privy Council; and as to that I do not think I could do better than read to you the recommendations which we have made. The last report of the Central Chamber on the subject was made last Christmas, at the end of the year, when these Resolutions were accepted and passed: "1. That all foreign animals intended to be slaughtered for meat should be landed at specified ports, and sent to markets separate from those used for English stock. That all such animals should be branded or marked on landing, and not allowed to be removed alive from the place of debarkation. 2. That proper quarantine grounds should be provided by Government for foreign store stock arriving from unscheduled countries, which stock should not be removed therefrom until seven clear days have elapsed. In the event of contagious diseases breaking out among any lot thus placed in quarantine, the whole should be slaughtered with the least possible delay. Cattle arriving at an English port from any country where pleuro-pneumonia exists should either be slaughtered upon arrival or be immediately inoculated for the disease, and then subjected to a quarantine of not less than 28 days. 3. That, in respect of animals from Ireland or other of the British Isles, so long as such islands are actually free from contagious disease no restriction should be imposed upon exportation or importation; animals coming therefrom should, in all respects, be treated as English, Welsh, or Scotch cattle, or animals arriving coastwise at one British port from another; but, in the event of contagious disease existing in either of these islands, no animals should leave such island until the owner has produced a certificate from the local authority of the district that no contagious disease existed upon the farm or premises, or adjoining farm or premises from which the animals come. Should the animals be unsound, or the owner fail to produce a satisfactory certificate, such animals not to be embarked until they have been subjected to such quarantine as the inspector may order, or in accordance with the rules to be issued by the Privy Council. 4. That all vessels used for the importation of animals be certified by the Board of Trade as to space, ventilation, convenience, &c.; and that regulations for the efficient cleansing and disinfecting of such vessels be issued and rigorously enforced. 5. That, in order to avoid the present diversity of action, all Orders in Council, or legislative enactments bearing upon the trade in disease in animals should be imperative and not permissive; further, that their application should extend throughout the United Kingdom. 6. That a universal system of local officers be established, such officers (farmers or veterinary surgeons) to be armed with powers to enter at all reasonable times upon farms and premises; to order isolation of diseased animals as well as those in contact with them; also to give orders as to the treatment of infected places; the owners of cattle or occupiers of premises to possess the right of refusing admittance to such officers until they have undergone the process of disinfection. 7. That provision be made to secure the practice of inspection throughout the three kingdoms being more thorough; to this end,

Chairman—continued.

end, a sufficient number of qualified men should be appointed by Government to act as itinerant inspectors, who should be charged with the duty of visiting fairs, markets, and ports, to see that local authorities, railway companies, wharfingers, shipping agents, local inspectors, &c., attend to the respective duties imposed on them by Orders in Council or Acts of Parliament. 8. That the owner of any animal affected with a contagious disease should be compelled to give immediate notice of such case to the local officer, nor should such animal, or those which have been in contact, be allowed to be removed, except for the purpose of isolation, until the inspector reports them free from disease. 9. That, upon the outbreak of contagious disease in any locality, the local inspector should have the power of prohibiting the movement of animals without an order, not only from the infected farm or premises, but, subject to the local authority, from any adjoining lands or premises the local inspector may deem requisite. 10. That, whenever foot-and-mouth disease or other contagious maladies become general or dangerously prevalent, it shall be the imperative duty of the Privy Council to order a temporary stoppage of fairs and markets, and prohibition of removal of animals except by license. 11. That, in respect of pleuro-pneumonia, all affected animals should be at once slaughtered, and the hides and offal buried; that when immediate notice has been given compensation be made to the owners at the rate of three-fourths the value of each animal, and the salvage of the carcase to belong to the owner, provided that the compensation and salvage together do not exceed the full value of the animal. That the remainder of the herd be isolated for a period of not less than eight clear weeks."

6789. As I understand, from those regulations which the Chamber proposed, whilst you would suggest restrictions on the foreign trade, you are prepared to submit to more stringent restrictions affecting the home trade?—Quite so.

6790. And speaking not only for the farmers in your county, but as a member of the Chamber of Agriculture, you believe that the farmers generally would be willing to submit to strict regulations?—The Council of the Central Chamber of Agriculture consists of representatives from 51 associated chambers. We have had this subject prominently before us ever since I have been a member, which is now five years, and I think I may say that it is the only subject upon which we are unanimous. I have never heard anybody express an objection to these stringent regulations which we recommend as affecting the home trade.

6791. With regard to more power being taken by the Privy Council in the appointment of inspectors, do you think that the local authority would submit to giving up their power in that matter?—Most certainly, with the greatest pleasure.

6792. Has the question of the remuneration of such a staff as that been considered by the Chamber?—It is the feeling of the Chamber that these regulations, and the consequent expenses, being rendered necessary by the importation of live animals, the cost ought, in all fairness, to be borne by the national exchequer.

6793. But I understand you to say that, with your recommendations as to the appointment of those inspectors, you combine recommendations which would prohibit the importation of live foreign animals altogether?—Yes.

6794. And therefore that plea for the charge being made an Imperial charge would not remain?—We think that the superior officials should be, as I believe they are now, paid by the Imperial exchequer; there are now travelling inspectors.

6795. Then you have not considered the question from the point of view from which Professor Brown looks at it; that is to say, that the whole permanent staff of inspectors should be a staff appointed by the Privy Council in all districts, subject to the authority and orders of the Privy Council, instead of the local authorities appointing their own inspectors in the several districts?—We carry out details through the police; they are paid half by the county and half by the Government.

6796. But Professor Brown's suggestion was that the appointment of the whole inspectors, whether they were the police utilised by the Privy Council for that purpose, or whether they were scientific inspectors, should rest in the Privy Council, for the purpose of bringing about uniformity, and giving the Privy Council a certainty that their instructions were properly carried out; do you believe that that would meet with the approval of the Chamber of Agriculture?—I do, decidedly.

6797. And whilst they suggest that the charge for such inspection should be an Imperial charge on account of the dangers from foreign import, supposing that those dangers were limited in the way that you have suggested, do you think that they would be willing to bear the charges of this inspection, although the system was worked by the Privy Council?—The charge is a secondary consideration as compared with the effects of the disease.

6798. And you think that, with a view of getting rid of the disease at home, the farmers generally would be prepared to submit, not only to those regulations, but, as taxpayers, to the charge for the inspection being placed upon them?—Decidedly.

6799. You have referred to the stoppage of imports of live stock from abroad; has it ever occurred to you, or has it been considered by the Chamber, whether there might be, especially in such a centre of population as London, great difficulty in supplying the dead meat, in consequence of that prohibition, in hot weather?—I have myself seen American meat in the Metropolitan Market last summer, in exceedingly hot weather, in splendid condition. That meat had been killed in America. Therefore I do not think that a difficulty would arise; but, provided that it did, I maintain that the English trade would most rapidly adapt itself to any scarcity of foreign supply in the summer.

6800. How do you mean that it would rapidly adapt itself; do you mean by that that there would be a large increase in the breeding stock throughout the country, and therefore a large increase in the home supply?—There would be a considerable increase in the home supply if we could get rid of these infectious diseases; but the point which I was raising was this: that the English farmers would be able to arrange to bring out their meat at any season they thought proper.

Mr. *Stratton.*

22 June 1877.

Chairman—continued.

6801. But the difficulty that occurs to me, in the event of a sudden stoppage of a large supply such as London depends upon, is whether it could be met by a supply of home stock. Although you say that you could adapt the home stock supply to the particular season when it was wanted, I imagine that there would still be a deficiency to the extent of the foreign import until you had bred up to the greater supply required?—No; if we found that there was a difficulty in getting foreign meat to London in the summer, we should expect the price to rise in the summer to a slight degree, perhaps to the extent of one halfpenny per pound. The result would be that we should arrange to bring our cattle into the market at the hottest season of the year, when the foreigners do not so sharply compete with us.

6802. As I understand you, you wish to stop the import of live animals altogether?—Yes.

6803. And if that diminished, as it has been stated to us that it would, the supply from abroad, on account of its driving a very large portion of that supply into other markets, would your home supply, even if it were sent into the market at a different time, be sufficient at its present amount to meet that loss?—The production of English meat could and would be increased to an enormous extent.

6804. But there would be a time, when you first suffered the loss of the foreign import, before you had bred up to the fresh requirements; and then there would be a rise in prices, would there not?—No; I do not think there would.

6805. I suppose you would point to the fact that this American dead-meat supply during the months when the foreign supply has been restricted on account of the cattle plague regulations, met the gap which was made by that loss?—Quite so. About the beginning of January, when the cattle plague broke out, there was a sudden stoppage of importation of German and Dutch beasts; you would have imagined that that would have raised the price of meat in the Metropolitan Market; but, on the contrary, meat was not at all dearer for the next month after that sudden cessation of the foreign supply than it had been before.

6806. Was that in consequence of the Deptford Meat Market being more largely supplied?—I imagine so.

6807. I suppose the months in which the cattle plague regulations were in force, were those months in which we were not so much dependent upon the foreign supply, because they were the colder months?—I am not aware that we get fewer in January than in the other months.

6808. The Schleswig-Holstein supply, for instance, does not come in until after the grass season; and that forms a large portion of the German supply, at all events; but still you represent that the growth of the home stock, together with the dead-meat trade, would prevent the rise of prices to the consumer by the restrictions which might possibly drive away the foreign cattle?—Yes.

6809. With regard to cattle plague, I suppose you would be prepared to submit to any regulations or restrictions centering in the Privy Council authority for dealing with that disease?—Certainly.

6810. Is there any other point which you wish to put before the Committee?—I have been very much surprised at the statement of the authorities of the Veterinary Department of the Privy Council, that farmers would not submit to severe restrictions. I have every opportunity of knowing what the opinion of farmers throughout the country is, and my experience has been that every farmer wishes for much more stringent regulations than we have yet had.

6811. As you have already stated, that the farmers generally, not only in your own county, but from your knowledge as a member of the Chamber which represents nearly the whole of England, throughout the country, are quite prepared to submit to stringent regulations for the purpose of getting rid of diseases which affect them so seriously?—Yes; and whenever we get an outbreak of rinderpest and the restrictions consequent upon it, we always get a great diminution in the prevalence of foot-and-mouth disease.

6812. Your experience, of course, extends over the time of the first outbreak of cattle plague in England?—Yes, I have been a member of the Contagious Diseases Committee for 12 years.

6813. As such you can endorse the evidence of other witnesses, that the regulations which have been enforced in that time have very much diminished the foot-and-mouth disease?—Very decidedly so, and at the present time we have no foot-and-mouth disease in the county of Wiltshire; we are more free from that disease than we have been for six or seven years.

6814. Notwithstanding the figures which you have given of the way in which it has decimated your herds, you believe that the disease has ceased in consequence of these few months' strict regulations?—Very much so.

6815. And you point to that and to other experience as evidence in favour of the possibility of stamping out the disease?—Quite so.

6816. Do you believe that the disease is sometimes not inbred in the animal, but produced by the condition of the animal?—I am quite certain that it can only be conveyed by contagion.

6817. That is your own practical experience?—Yes, as well as the result of my reading veterinary authorities.

6818. But you are not aware of its having broken out in your district in the way that it has been stated to have broken out in other places in England?—It has often broken out without my being able to trace the way in which it came, but I have never doubted for a moment that it was conveyed by contagion.

6819. You think that it may have been brought in the way that has been suggested to this Committee, either by dogs or by other animals passing over the ground from an infected district?—Quite so. If my neighbour gets foot-and-mouth disease, I know there are ten chances to one that I shall get it too, although there may be two or three roads between us. It is conveyed by birds, and hares, and rabbits, and every thing.

6820. Is there anything else that you would like to point out to the Committee?—I wish to point out that the prevalence of contagious diseases here closes the world against our exporting animals.

6821. You represent that another great cause of loss to the agriculturist here is, that these diseases prevent his export trade of high-bred animals?—Quite so; and, as a consequence, they prevent the improvement of the continental stock. It has been stated in evidence here that the continental

Chairman—continued.

continental stock is very much inferior to the American stock; but my father did a great trade in sending animals to France, and Germany, and Hungary 10 or 15 years ago, of the improved shorthorn breed; that trade has been completely destroyed by the prevalence of disease in this country. The whole world is closed against our stock now.

6822. And until we get in this country freedom from these diseases, those restrictions act prejudicially on our trade?—Yes, as well as prejudicially on the improvement of the meat which would be imported.

Major *Allen.*

6823. In reference to the dairy counties, foot-and-mouth disease is most disastrous, is it not?—Yes.

6824. And, from your experience, do you think that those farmers carrying on that particular branch of business, viz., a dairy business, would submit to anything in the world for the purpose of getting rid of that disease?—Most decidedly I do.

6825. They do not think that it is an unfair thing on the part of the Government to place those restrictions on foreign cattle, if the farmer himself is prepared to submit to any restrictions on home cattle?—Decidedly. The English farmer would only submit to those restrictions on the chances of a fresh importation of disease being prevented by slaughter or quarantine.

Mr. *Arthur Peel.*

6826. It is generally observed, is it not, that foot-and-mouth disease dies out almost entirely when the regulations for cattle plague are in force?—Certainly.

6827. You would not advocate, therefore, that regulations against cattle plague should be continued in the absence of cattle plague?—I would recommend that such regulations as I have submitted to the Chairman should be continuous.

6828. Are they pretty nearly as stringent as those for cattle plague?—They do not extend to slaughter, but that is the only point upon which they are less stringent.

6829. When you say that the whole world is closed against our stock, on account of what diseases is it so closed?—On account of foot-and-mouth disease and pleuro-pneumonia; Australia has prohibited the importation for some years, and I believe that the Continent has done so too.

6830. Is it not only on account of cattle plague?—At present perhaps it is.

6831. Therefore you would have them admit our cattle when there was no cattle plague, but you would not take theirs so long as any foot-and-mouth disease or pleuro-pneumonia remained in any of those countries?—I would take them under quarantine, and they might take ours under quarantine.

6832. In the absence of cattle plague?—In the absence of cattle plague.

6833. If there was pleuro-pneumonia or foot-and-mouth disease in those countries, you would admit them?—Yes, under quarantine.

Colonel *Kingscote.*

6834. You have suffered from foot-and-mouth disease yourself?—Yes, a great many times.

Colonel *Kingscote*—continued.

6835. Would you like to take 2 *l.* a head for every milch-cow that you had that was attacked with foot-and-mouth disease?—In the case of milking cows being attacked with foot-and-mouth disease in the summer, the losses would be 5 *l.* per head; but if I had a number of young stock affected with the disease, the loss would roughly average 2 *l.* a head.

6836. You have very severe losses both in milk and in the cows not getting in calf again?—Yes.

6837. Do you think that the fear of disease prevents the farmers breeding so much as they otherwise would?—I am sure it does to a great extent.

6838. Do you think that the country could stand more stock?—Enormously more stock. The agricultural returns show that the production of stock has fallen off very materially within the last four or five years, and, as that has been a period of low prices for corn, as a matter of course the farmers would have increased their stock if the price had been remunerative; but the price is not remunerative, and the only thing that has made it unremunerative has been the prevalence of contagious diseases, and more especially of foot-and-mouth disease.

6839. Have you not traced foot-and-mouth disease very much in the neighbourhood of a railway; for instance, in your own country has it not gone along the railway to Chippenham, from which place there is a quick access to a big market like Bristol?—In our county it has been nearly always brought from Bristol market; and we always know when we are about to have a serious attack of it; as soon as one cargo of infected beasts is brought into Bristol, we are sure to have a succession of infected cargoes. The diseases break out in those animals about three or four days after they are landed. I believe the Irish beasts when they are put on board the boats are perfectly healthy, but the period of incubation being about four days, you find about the third or fourth day after the beasts come off the boats that they have the disease, and they come into our county, and spread the disease.

Mr. *Anderson.*

6840. This importation to Bristol is all from Ireland, is it not?—It is all from Ireland.

6841. And you say that they are perfectly sound when they are put on board in Ireland?—The first cargo that contains infected animals infects the boats, and then all the others that pass through that boat become impregnated by means of the saliva from those.

6842. Then better regulations for the transport of those animals will stop that?—I believe that with better regulations for cleansing ships for the transport of animals it might be prevented.

6843. Then that would do quite as well as stopping the importation, would it not?—We do not wish to stop the importation of Irish cattle.

6844. Although it is from Irish cattle that foot-and-mouth disease comes?—Yes, it is from want of attention to details.

6845. We have had similar evidence about the transport of animals from Ireland from a number of different witnesses; is it your opinion that both pleuro-pneumonia and foot-and-mouth disease are distinctly imported diseases?—They were originally distinctly imported diseases.

Mr. *Stratton.*

22 June 1877.

Mr. *Anderson*—continued.

6846. Do you think that if you got quit of them in this country you would not get them back again, supposing that importation was stopped?—I think that if any escape the quarantine we should be able to isolate them and destroy the disease.

6847. Would not the disease break out in this country if there was no importation?—Certainly not, if we destroyed all the germs in this country.

6848. Did we never have pleuro-pneumonia or foot-and-mouth disease before we had foreign importation?—No, not before the importation of raw hides was allowed; it may have been in that way, or it may have been in other ways that the disease was first imported; I know not.

6849. You do not believe that it could break out of itself among cattle, simply because it is a cattle disease pertaining to cattle?—Certainly not; I believe that it must be conveyed by germs in the same way as small-pox from some place or other; I believe that the scientific theory of it accords with my experience and practice.

Mr. *John Holms.*

6850. Have you as much trouble with imported sheep as with imported cattle?—Sheep scab and foot-and-mouth disease are very prevalent in imported sheep, I believe.

6851. But you do not find that they interfere with you so much as disease in cattle?—Cattle are more liable to foot-and-mouth disease than sheep.

6852. You say that you have considerable power to extend your breeding and growth of cattle; could you not extend your breeding and growth of sheep in preference to cattle if you find less disease amongst them?—The statistics which I have read show that the losses in sheep are only a little less serious than in cattle; they are very frightful; one-sixth of our sheep were affected in the year 1872.

Mr. *French.*

6853. In one of those rules which you read out just now, you said that you would be in favour of sending foreign animals to a market separate from English stock; do you mean that you would create a new market solely for the sale of foreign stock?—There is a market already existing at Deptford which we think ought to have all foreign cattle sent to it.

6854. You would not allow any importation of stores from any continental country?—Yes; I would have a quarantine station established at certain ports to be defined by the Privy Council, in the same way as has already been done at Southampton with regard to the importation of stores from France. There is a quarantine station at Southampton which has been in use for some time with regard to the French importation.

6855. Have you seen any of those boats that are complained of, that came into Bristol from Ireland?—I have never been down into the holds of them, but I can tell from the state of the cattle when they are landed that they suffer frightful hardships.

6856. I believe that a great many of them are carried on deck?—I believe that the greater part of them are carried in the hold; it would be less objectional if they were carried on deck.

Mr. *French*—continued.

6857. Do you think that there is more foot-and-mouth disease existing in Ireland than in England?—No, I do not.

6858. Then how do you account for foot-and-mouth disease always coming to you from Ireland?—Because if you only put five or six infected animals on board an Irish boat the saliva from those five or six beasts will so impregnate that boat that all the others that pass through the boat contract the disease; I believe they are infected not in Ireland but in the boat.

6859. You think that, by the boats being properly regulated as to disinfection when they have landed the cattle, you would prevent all that?—I do; I believe you might have a safe trade with Ireland.

6860. Have the Bristol authorities no power at present to deal with such a matter as that?—They do not care to exercise it if they have.

6861. Then it is the fault of your own local authorities?—Yes, a great deal. We ask that the Government shall override those authorities in such matters.

6862. Do you think that the restrictions which are at present in force with regard to cattle plague would stamp out foot-and-mouth disease altogether after awhile?—I think they would if they were applied.

6863. Do you think that it would be possible to prevent the spread of foot-and-mouth disease by those restrictions, in view of the fact that it is spread about by birds and animals, and those sort of things that you cannot stop?—Those returns which we have collected in the county of Wilts show that the disease always reaches the minimum in the spring, that is to say, after the cattle have been in yards comparatively isolated during the winter; and immediately the contact is established in the fields by the stocking of the pastures it spreads and reaches the maximum about the end of September, and the cattle are then brought back into the sheds and the disease gradually decreases again.

6864. You do not think that the weather has anything to do with it?—I think that animal life is more active in the summer, and that there are more vehicles which convey the contagion; birds are more numerous, and flies may carry it over a hedge from one herd to another.

Mr. *Chamberlain.*

6865. You gave some statistics of your losses in Wiltshire; do you know whether they are proportionate in other counties, or do you suffer more in Wiltshire than they do in other counties?—I believe it is a fair specimen of the losses in pastoral districts. Perhaps I should qualify that by saying that it is a fair specimen of the losses in such districts as are in the line of the traffic of cattle. In Cornwall and Devonshire, which is a breeding district, and imports very few beasts, it is very rare indeed.

6866. But in what you call a pastoral district, it would not be an unusual thing that half the cattle should be down in a single year with foot-and-mouth disease?—It would certainly not be an unprecedented thing.

6867. I understood you to say in answer to the Chairman, that whilst you thought that the cost of these regulations might be borne by the National Exchequer, still, if Parliament should think otherwise, the farmers as taxpayers would have

Mr. *Chamberlain*—continued.

have no objection to bear the cost themselves?—I believe they would not object.

6868. I understood you to say that so long as Ireland was proved to be free from disease you would impose no restrictions at all on imports of cattle from Ireland?—No.

6869. But Ireland during the last 10 years has never been free from foot-and-mouth disease, has it?—Ireland has never been free from pleuro-pneumonia and foot-and-mouth disease. The regulations are that we should require a license.

6870. Therefore during the whole of that period your regulations would apply?—Yes, they would apply during the whole of that period.

6871. I understand that those regulations involve a certificate or license before any cattle can be embarked?—Yes.

6872. What would be the purport of that certificate?—That certificate would affirm that neither foot-and-mouth disease, nor pleuro-pneumonia, nor cattle plague existed on the farm or premises from which the animals were removed, or on any adjoining farm or premises.

6873. Do you think that that would be a sufficient security?—I am satisfied that that regulation would have the effect of preventing the importation of disease.

6874. Would not similar regulations be sufficient for all movement of cattle in this country?—Certainly.

6875. You would say, then, that cattle should be freely moved, subject to a certificate given by the proper inspector that the disease did not exist on the premises from which the cattle came, or on any neighbouring premises?—Certainly.

Mr. *Ritchie.*

6876. I understood from the first recommendation which you read that you were willing that cattle should be imported alive, and slaughtered at the point of debarkation?—Our Chamber has always held that point, because we thought that we were more likely to get that than slaughter at the port of embarkation. We have only asked for the minimum which we thought was required. We should prefer slaughter at the port of embarkation.

Chairman.

6877. I understood your answer to me to be that you adhered, and that the Chamber adhered, to those resolutions which you have passed?—Yes, as a minimum which would be satisfactory.

Mr. *Ritchie.*

6878. That recommendation does not agree with what you now said as to the entire prohibition of live animals?—I do not ask for that; I ask that they shall be all slaughtered on landing.

6879. But I understood you to say that you now wished to have them stopped altogether?—No. We should prefer it, but we do not demand that as a minimum. Our policy has always been to ask for as little in the way of restriction as we think can be borne.

6880. If foreign animals were stopped from coming to this country alive, do you say that you do not believe that there would be any rise in the price of meat, even for a time?—Yes, the result has proved it. During the month of January there was a total cessation of the import of German stock, and of nearly all continental stock, I believe; yet there was no rise; the markets were lower in January than in December.

Mr. *Ritchie*—continued.

6881. Do you know what proportion of live and dead meat comes into the London market?—I do not; I believe that the proportion of foreign meat that comes into London is very great.
